Mr. Gore was one of those overseers, who could torture the slightest word or look into impudence; he had the nerve, not only to resent, but to punish, promptly and severely. He never allowed himself to be answered back, by a slave. In this, he was as lordly and as imperious as Col. Edward Lloyd, himself; acting always up to the maxim, practically maintained by slaveholders, that it is better that a dozen slaves suffer under the lash, without fault, than that the master or the overseer should _seem_ to have been wrong in the presence of the slave. _Everything must be absolute here_. Guilty or not guilty, it is enough to be accused, to be sure of a flogging. The very presence of this man Gore was painful, and I shunned him as I would have shunned a rattlesnake. His piercing, black eyes, and sharp, shrill voice, ever awakened sensations of terror among the slaves. For so young a man (I describe him as he was, twenty-five or thirty years ago) Mr. Gore was singularly reserved and grave in the presence of slaves. He indulged in no jokes, said no funny things, and kept his own counsels. Other overseers, how brutal soever they might be, were, at times, inclined to gain favor with the slaves, by indulging a little pleasantry; but Gore was never known to be guilty of any such weakness. He was always the cold, distant, unapproachable _overseer_ of Col. Edward Lloyd's plantation, and needed no higher pleasure than was involved in a faithful discharge of the duties of his office. When he whipped, he seemed to do so from a sense of duty, and feared no consequences. What Hopkins did reluctantly, Gore did with alacrity. There was a stern will, an iron-like reality, about this Gore, which would have easily made him the chief of a band of pirates, had his environments been favorable to such a course of life. All the coolness, savage barbarity and freedom from moral restraint, which are necessary in the character of a pirate-chief, centered, I think, in this man Gore. Among many other deeds of shocking cruelty which he perpetrated, while I was at Mr. Lloyd's, was the murder of a young colored man, named Denby. He was sometimes called Bill Denby, or Demby; (I write from sound, and the sounds on Lloyd's plantation are not very certain.) I knew him well. He was a powerful young man, full of animal spirits, and, so far as I know, he was among the most valuable of Col. Lloyd's slaves. In something—I know not what—he offended this Mr. Austin Gore, and, in accordance with the custom of the latter, he under took to flog him. He gave Denby but few stripes; the latter broke away from him and plunged into the creek, and, standing there to the depth of his neck in water, he refused to come out at the order of the overseer; whereupon, for this refusal, _Gore shot him dead!_ It is said that Gore gave Denby three calls, telling him that if he did not obey the last call, he would shoot him. When the third call was given, Denby stood his ground firmly; and this raised the question, in the minds of the by-standing slaves—"Will he dare to shoot?" Mr. Gore, without further parley, and without making any further effort to induce Denby to come out of the water, raised his gun deliberately to his face, took deadly aim at his standing victim, and, in an instant, poor Denby was numbered with the dead. His mangled body sank out of sight, and only his warm, red blood marked the place where he had stood.

This devilish outrage, this fiendish murder, produced, as it was well calculated to do, a tremendous sensation. A thrill of horror flashed through every soul on the plantation, if I may except the guilty wretch who had committed the hell-black deed. While the slaves generally were panic-struck, and howling with alarm, the murderer himself was calm and collected, and appeared as though nothing unusual had happened. The atrocity roused my old master, and he spoke out, in reprobation of it; but the whole thing proved to be less than a nine days' wonder. Both Col. Lloyd and my old master arraigned Gore for his cruelty in the matter, but this amounted to nothing. His reply, or explanation—as I remember to have heard it at the time was, that the extraordinary expedient was demanded by necessity; that Denby had become unmanageable; that he had set a dangerous example to the other slaves; and that, without some such prompt measure as that to which he had resorted, were adopted, there would be an end to all rule and

order on the plantation. That very convenient covert for all manner of cruelty and outrage that cowardly alarm-cry, that the slaves would _“take the place,”_ was pleaded, in extenuation of this revolting crime, just as it had been cited in defense of a thousand similar ones. He argued, that if one slave refused to be corrected, and was allowed to escape with his life, when he had been told that he should lose it if he persisted in his course, the other slaves would soon copy his example; the result of which would be, the freedom of the slaves, and the enslavement of the whites. I have every reason to believe that Mr. Gore’s defense, or explanation, was deemed satisfactory—at least to Col. Lloyd. He was continued in his office on the plantation. His fame as an overseer went abroad, and his horrid crime was not even submitted to judicial investigation. The murder was committed in the presence of slaves, and they, of course, could neither institute a suit, nor testify against the murderer. His bare word would go further in a court of law, than the united testimony of ten thousand black witnesses.

All that Mr. Gore had to do, was to make his peace with Col. Lloyd. This done, and the guilty perpetrator of one of the most foul murders goes unwhipped of justice, and uncensured by the community in which he lives. Mr. Gore lived in St. Michael’s, Talbot county, when I left Maryland; if he is still alive he probably yet resides there; and I have no reason to doubt that he is now as highly esteemed, and as greatly respected, as though his guilty soul had never been stained with innocent blood. I am well aware that what I have now written will by some be branded as false and malicious. It will be denied, not only that such a thing ever did transpire, as I have now narrated, but that such a thing could happen in _Maryland_. I can only say—believe it or not—that I have said nothing but the literal truth, gainsay it who may.

I speak advisedly when I say this,—that killing a slave, or any colored person, in Talbot county, Maryland, is not treated as a crime, either by the courts or the community. Mr. Thomas Lanman, ship carpenter, of St. Michael’s, killed two slaves, one of whom he butchered with a hatchet, by knocking his brains out. He used to boast of the commission of the awful and bloody deed. I have heard him do so, laughingly, saying, among other things, that he was the only benefactor of his country in the company, and that when “others would do as much as he had done, we should be relieved of the d—d niggers.”

As an evidence of the reckless disregard of human life where the life is that of a slave I may state the notorious fact, that the wife of Mr. Giles Hicks, who lived but a short distance from Col. Lloyd’s, with her own hands murdered my wife’s cousin, a young girl between fifteen and sixteen years of age—mutilating her person in a most shocking manner. The atrocious woman, in the paroxysm of her wrath, not content with murdering her victim, literally mangled her face, and broke her breast bone. Wild, however, and infuriated as she was, she took the precaution to cause the slave-girl to be buried; but the facts of the case coming abroad, very speedily led to the disinterment of the remains of the murdered slave-girl. A coroner’s jury was assembled, who decided that the girl had come to her death by severe beating. It was ascertained that the offense for which this girl was thus hurried out of the world, was this: she had been set that night, and several preceding nights, to mind Mrs. Hicks’s baby, and having fallen into a sound sleep, the baby cried, waking Mrs. Hicks, but not the slave-girl. Mrs. Hicks, becoming infuriated at the girl’s tardiness, after calling several times, jumped from her bed and seized a piece of fire-wood from the fireplace; and then, as she lay fast asleep, she deliberately pounded in her skull and breast-bone, and thus ended her life. I will not say that this most horrid murder produced no sensation in the community. It _did_ produce a sensation; but, incredible to tell, the moral sense of the community was blunted too entirely by the ordinary nature of slavery horrors, to bring the murderess to punishment. A warrant was issued for her arrest, but, for some reason or other, that warrant was never served. Thus did Mrs. Hicks not only escape condign punishment, but even the pain and mortification of being arraigned before a court of justice.

Whilst I am detailing the bloody deeds that took place during my stay on Col. Lloyd’s plantation, I will briefly narrate another dark transaction, which occurred about the same time as the murder of Denby by Mr. Gore.

On the side of the river Wye, opposite from Col. Lloyd’s, there lived a Mr. Beal Bondley, a wealthy slaveholder. In the direction of his land, and near the shore, there was an excellent oyster fishing ground, and to this, some of the slaves of Col. Lloyd occasionally resorted in their little canoes, at night, with a view to make up the deficiency of their scanty allowance of food, by the oysters that they could easily get there. This, Mr. Bondley took it into his head to regard as a trespass, and while an old man belonging to Col. Lloyd was engaged in catching a few of the many millions of oysters that lined the bottom of that creek, to satisfy his hunger, the villainous Mr. Bondley, lying in ambush, without the slightest ceremony, discharged the contents of his musket into the back and shoulders of the poor old man. As good fortune would have it, the shot did not prove mortal, and Mr. Bondley came over, the next day, to see Col. Lloyd—whether to pay him for his property, or to justify himself for what he had done, I know not; but this I _can_ say, the cruel and dastardly transaction was speedily hushed up; there was very little said about it at all, and nothing was publicly done which looked like the application of the principle of justice to the man whom _chance_, only, saved from being an actual murderer. One of the commonest sayings to which my ears early became accustomed, on Col. Lloyd’s plantation and elsewhere in

Maryland, was, that it was _“worth but half a cent to kill a nigger, and a half a cent to bury him;”_ and the facts of my experience go far to justify the practical truth of this strange proverb. Laws for the protection of the lives of the slaves, are, as they must needs be, utterly incapable of being enforced, where the very parties who are nominally protected, are not permitted to give evidence, in courts of law, against the only class of persons from whom abuse, outrage and murder might be reasonably apprehended. While I heard of numerous murders committed by slaveholders on the Eastern Shores of Maryland, I never knew a solitary instance in which a slaveholder was either hung or imprisoned for having murdered a slave. The usual pretext for killing a slave is, that the slave has offered resistance. Should a slave, when assaulted, but raise his hand in self defense, the white assaulting party is fully justified by southern, or Maryland, public opinion, in shooting the slave down. Sometimes this is done, simply because it is alleged that the slave has been saucy. But here I leave this phase of the society of my early childhood, and will relieve the kind reader of these heart-sickening details.

CHAPTER IX. _Personal Treatment_

MISS LUCRETIA—HER KINDNESS—HOW IT WAS MANIFESTED—“IKE”—A BATTLE WITH HIM—THE CONSEQUENCES THEREOF—MISS LUCRETIA’S BALSAM—BREAD—HOW I OBTAINED IT—BEAMS OF SUNLIGHT AMIDST THE GENERAL DARKNESS—SUFFERING FROM COLD—HOW WE TOOK OUR MEALS—ORDERS TO PREPARE FOR BALTIMORE—OVERJOYED AT THE THOUGHT OF QUITTING THE PLANTATION—EXTRAORDINARY CLEANSING—COUSIN TOM’S VERSION OF BALTIMORE—ARRIVAL THERE—KIND RECEPTION GIVEN ME BY MRS. SOPHIA AULD—LITTLE TOMMY—MY NEW POSITION—MY NEW DUTIES—A TURNING POINT IN MY HISTORY.

I have nothing cruel or shocking to relate of my own personal experience, while I remained on Col. Lloyd’s plantation, at the home of my old master. An occasional cuff from Aunt Katy, and a regular whipping from old master, such as any heedless and mischievous boy might get from his father, is all that I can mention of this sort. I was not old enough to work in the field, and, there being little else than field work to perform, I had much leisure. The most I had to do, was, to drive up the cows in the evening, to keep the front yard clean, and to perform small errands for my young mistress, Lucretia Auld. I have reasons for thinking this lady was very kindly disposed toward me, and, although I was not often the object of her attention, I constantly regarded her as my friend, and was always glad when it was my privilege to do her a service. In a family where there was so much that was harsh, cold and indifferent, the slightest word or look of kindness passed, with me, for its full value. Miss Lucretia—as we all continued to call her long after her marriage—had bestowed upon me such words and looks as taught me that she pitied me, if she did not love me. In addition to words and looks, she sometimes gave me a piece of bread and butter; a thing not set down in the bill of fare, and which must have been an extra ration, planned aside from either Aunt Katy or old master, solely out of the tender regard and friendship she had for me. Then, too, I one day got into the wars with Uncle Able’s son, “Ike,” and had got sadly worsted; in fact, the little rascal had struck me directly in the forehead with a sharp piece of cinder, fused with iron, from the old blacksmith’s forge, which made a cross in my forehead very plainly to be seen now. The gash bled very freely, and I roared very loudly and betook myself home. The coldhearted Aunt Katy paid no attention either to my wound or my roaring, except to tell me it served me right; I had no business with Ike; it was good for me; I would now keep away _“from dem Lloyd niggers.”_ Miss Lucretia, in this state of the case, came forward; and, in quite a different spirit from that manifested by Aunt Katy, she called me into the parlor (an extra privilege of itself) and, without using toward me any of the hard-hearted and reproachful epithets of my kitchen tormentor, she quietly acted the good Samaritan. With her own soft hand she washed the blood from my head and face, fetched her own balsam bottle, and with the balsam wetted a nice piece of white linen, and bound up my head. The balsam was not more healing to the wound in my head, than her kindness was healing to the wounds in my spirit, made by the unfeeling words of Aunt Katy. After this, Miss Lucretia was my friend. I felt her to be such; and I have no doubt that the simple act of binding up my head, did much to awaken in her mind an interest in my welfare. It is quite true, that this interest was never very marked, and it seldom showed itself in anything more than in giving me a piece of bread when I was hungry; but this was a great favor on a slave plantation, and I was the only one of the children to whom such attention was paid. When very hungry, I would go into the back yard and play under Miss Lucretia’s window. When pretty severely pinched by hunger, I had a habit of singing, which the good lady very soon came to understand as a petition for a piece of bread. When I sung under Miss Lucretia’s window, I was very apt to get well paid for my music. The reader will see that I now had two friends, both at important points—Mas’ Daniel at the great house, and Miss Lucretia at home. From Mas’ Daniel I got protection from the bigger boys; and from Miss Lucretia I got bread, by singing when I was hungry, and sympathy when I was abused by that termagant, who had the reins of government in the kitchen. For such friendship I felt deeply grateful, and bitter as are my recollections of slavery, I love to recall any instances of kindness, any sunbeams of humane treatment, which found way to my soul through the iron grating of my house of bondage. Such beams seem all the brighter from the

general darkness into which they penetrate, and the impression they make is vividly distinct and beautiful.

As I have before intimated, I was seldom whipped—and never severely—by my old master. I suffered little from the treatment I received, except from hunger and cold. These were my two great physical troubles. I could neither get a sufficiency of food nor of clothing; but I suffered less from hunger than from cold. In hottest summer and coldest winter, I was kept almost in a state of nudity; no shoes, no stockings, no jacket, no trowsers; nothing but coarse sackcloth or tow-linen, made into a sort of shirt, reaching down to my knees. This I wore night and day, changing it once a week. In the day time I could protect myself pretty well, by keeping on the sunny side of the house; and in bad weather, in the corner of the kitchen chimney. The great difficulty was, to keep warm during the night. I had no bed. The pigs in the pen had leaves, and the horses in the stable had straw, but the children had no beds. They lodged anywhere in the ample kitchen. I slept, generally, in a little closet, without even a blanket to cover me. In very cold weather. I sometimes got down the bag in which corn-meal was usually carried to the mill, and crawled into that. Sleeping there, with my head in and feet out, I was partly protected, though not comfortable. My feet have been so cracked with the frost, that the pen with which I am writing might be laid in the gashes. The manner of taking our meals at old master's, indicated but little refinement. Our corn-meal mush, when sufficiently cooled, was placed in a large wooden tray, or trough, like those used in making maple sugar here in the north. This tray was set down, either on the floor of the kitchen, or out of doors on the ground; and the children were called, like so many pigs; and like so many pigs they would come, and literally devour the mush—some with oyster shells, some with pieces of shingles, and none with spoons. He that eat fastest got most, and he that was strongest got the best place; and few left the trough really satisfied. I was the most unlucky of any, for Aunt Katy had no good feeling for me; and if I pushed any of the other children, or if they told her anything unfavorable of me, she always believed the worst, and was sure to whip me.

As I grew older and more thoughtful, I was more and more filled with a sense of my wretchedness. The cruelty of Aunt Katy, the hunger and cold I suffered, and the terrible reports of wrong and outrage which came to my ear, together with what I almost daily witnessed, led me, when yet but eight or nine years old, to wish I had never been born. I used to contrast my condition with the black-birds, in whose wild and sweet songs I fancied them so happy! Their apparent joy only deepened the shades of my sorrow. There are thoughtful days in the lives of children—at least there were in mine when they grapple with all the great, primary subjects of knowledge, and reach, in a moment, conclusions which no subsequent experience can shake. I was just as well aware of the unjust, unnatural and murderous character of slavery, when nine years old, as I am now. Without any appeal to books, to laws, or to authorities of any kind, it was enough to accept God as a father, to regard slavery as a crime.

I was not ten years old when I left Col. Lloyd's plantation for Balitmore(sic). I left that plantation with inexpressible joy. I never shall forget the ecstacy with which I received the intelligence from my friend, Miss Lucretia, that my old master had determined to let me go to Baltimore to live with Mr. Hugh Auld, a brother to Mr. Thomas Auld, my old master's son-in-law. I received this information about three days before my departure. They were three of the happiest days of my childhood. I spent the largest part of these three days in the creek, washing off the plantation scurf, and preparing for my new home. Mrs. Lucretia took a lively interest in getting me ready. She told me I must get all the dead skin off my feet and knees, before I could go to Baltimore, for the people there were very cleanly, and would laugh at me if I looked dirty; and, besides, she was intending to give me a pair of trowsers, which I should not put on unless I got all the dirt off. This was a warning to which I was bound to take heed; for the thought of owning a pair of trowsers, was great, indeed. It was almost a sufficient motive, not only to induce me to scrub off the _mange_ (as pig drovers would call it) but the skin as well. So I went at it in good earnest, working for the first time in the hope of reward. I was greatly excited, and could hardly consent to sleep, lest I should be left. The ties that, ordinarily, bind children to their homes, were all severed, or they never had any existence in my case, at least so far as the home plantation of Col. L. was concerned. I therefore found no severe trail at the moment of my departure, such as I had experienced when separated from my home in Tuckahoe. My home at my old master's was charmless to me; it was not home, but a prison to me; on parting from it, I could not feel that I was leaving anything which I could have enjoyed by staying. My mother was now long dead; my grandmother was far away, so that I seldom saw her; Aunt Katy was my unrelenting tormentor; and my two sisters and brothers, owing to our early separation in life, and the family-destroying power of slavery, were, comparatively, strangers to me. The fact of our relationship was almost blotted out. I looked for _home_ elsewhere, and was confident of finding none which I should relish less than the one I was leaving. If, however, I found in my new home to which I was going with such blissful anticipations—hardship, whipping and nakedness, I had the questionable consolation that I should not have escaped any one of these evils by remaining under the management of Aunt Katy. Then, too, I thought, since I had endured much in this line on Lloyd's plantation, I could endure as much elsewhere, and especially at Baltimore; for I had something of the feeling about that city which is expressed in the saying, that being "hanged in England, is better than dying a natural death in Ireland." I had the strongest desire to see Baltimore. My cousin Tom—a boy two or three years older than I—had been there, and though not fluent (he stuttered immoderately) in speech, he had inspired me with that desire, by

his eloquent description of the place. Tom was, sometimes, Capt. Auld's cabin boy; and when he came from Baltimore, he was always a sort of hero amongst us, at least till his Baltimore trip was forgotten. I could never tell him of anything, or point out anything that struck me as beautiful or powerful, but that he had seen something in Baltimore far surpassing it. Even the great house itself, with all its pictures within, and pillars without, he had the hardihood to say "was nothing to Baltimore." He bought a trumpet (worth six pence) and brought it home; told what he had seen in the windows of stores; that he had heard shooting crackers, and seen soldiers; that he had seen a steamboat; that there were ships in Baltimore that could carry four such sloops as the "Sally Lloyd." He said a great deal about the market-house; he spoke of the bells ringing; and of many other things which roused my curiosity very much; and, indeed, which heightened my hopes of happiness in my new home.

We sailed out of Miles river for Baltimore early on a Saturday morning. I remember only the day of the week; for, at that time, I had no knowledge of the days of the month, nor, indeed, of the months of the year. On setting sail, I walked aft, and gave to Col. Lloyd's plantation what I hoped would be the last look I should ever give to it, or to any place like it. My strong aversion to the great farm, was not owing to my own personal suffering, but the daily suffering of others, and to the certainty that I must, sooner or later, be placed under the barbarous rule of an overseer, such as the accomplished Gore, or the brutal and drunken Plummer. After taking this last view, I quitted the quarter deck, made my way to the bow of the sloop, and spent the remainder of the day in looking ahead; interesting myself in what was in the distance, rather than what was near by or behind. The vessels, sweeping along the bay, were very interesting objects. The broad bay opened like a shoreless ocean on my boyish vision, filling me with wonder and admiration.

Late in the afternoon, we reached Annapolis, the capital of the state, stopping there not long enough to admit of my going ashore. It was the first large town I had ever seen; and though it was inferior to many a factory village in New England, my feelings, on seeing it, were excited to a pitch very little below that reached by travelers at the first view of Rome. The dome of the state house was especially imposing, and surpassed in grandeur the appearance of the great house. The great world was opening upon me very rapidly, and I was eagerly acquainting myself with its multifarious lessons.

We arrived in Baltimore on Sunday morning, and landed at Smith's wharf, not far from Bowly's wharf. We had on board the sloop a large flock of sheep, for the Baltimore market; and, after assisting in driving them to the slaughter house of Mr. Curtis, on Loudon Slater's Hill, I was speedily conducted by Rich—one of the hands belonging to the sloop—to my new home in Alliciana street, near Gardiner's ship-yard, on Fell's Point. Mr. and Mrs. Hugh Auld, my new mistress and master, were both at home, and met me at the door with their rosy cheeked little son, Thomas, to take care of whom was to constitute my future occupation. In fact, it was to "little Tommy," rather than to his parents, that old master made a present of me; and though there was no _legal_ form or arrangement entered into, I have no doubt that Mr. and Mrs. Auld felt that, in due time, I should be the legal property of their bright-eyed and beloved boy, Tommy. I was struck with the appearance, especially, of my new mistress. Her face was lighted with the kindliest emotions; and the reflex influence of her countenance, as well as the tenderness with which she seemed to regard me, while asking me sundry little questions, greatly delighted me, and lit up, to my fancy, the pathway of my future. Miss Lucretia was kind; but my new mistress, "Miss Sophy," surpassed her in kindness of manner. Little Thomas was affectionately told by his mother, that _"there was his Freddy,"_ and that "Freddy would take care of him;" and I was told to "be kind to little Tommy"—an injunction I scarcely needed, for I had already fallen in love with the dear boy; and with these little ceremonies I was initiated into my new home, and entered upon my peculiar duties, with not a cloud above the horizon.

I may say here, that I regard my removal from Col. Lloyd's plantation as one of the most interesting and fortunate events of my life. Viewing it in the light of human likelihoods, it is quite probable that, but for the mere circumstance of being thus removed before the rigors of slavery had fastened upon me; before my young spirit had been crushed under the iron control of the slave-driver, instead of being, today, a FREEMAN, I might have been wearing the galling chains of slavery. I have sometimes felt, however, that there was something more intelligent than _chance_, and something more certain than _luck_, to be seen in the circumstance. If I have made any progress in knowledge; if I have cherished any honorable aspirations, or have, in any manner, worthily discharged the duties of a member of an oppressed people; this little circumstance must be allowed its due weight in giving my life that direction. I have ever regarded it as the first plain manifestation of that

Divinity that shapes our ends, Rough hew them as we will.

I was not the only boy on the plantation that might have been sent to live in Baltimore. There was a wide margin from which to select. There were boys younger, boys older, and boys of the same age, belonging to my old master some at his own house, and some at his farm—but the high privilege fell to my lot.

I may be deemed superstitious and egotistical, in regarding this event as a special interposition of Divine Providence in my favor; but the thought is a part of my history, and I should be false to the earliest and most cherished sentiments of my soul, if I suppressed, or hesitated to avow that opinion, although it may be characterized as irrational by the wise, and ridiculous by the scoffer. From my earliest recollections of serious matters, I date the entertainment of something like an ineffaceable conviction, that slavery would not always be able to hold me within its foul embrace; and this conviction, like a word of living faith, strengthened me through the darkest trials of my lot. This good spirit was from God; and to him I offer thanksgiving and praise.

CHAPTER X. _Life in Baltimore_

CITY ANNOYANCES—PLANTATION REGRETS—MY MISTRESS, MISS SOPHA—HER HISTORY—HER KINDNESS TO ME—MY MASTER, HUGH AULD—HIS SOURNESS—MY INCREASED SENSITIVENESS—MY COMFORTS—MY OCCUPATION—THE BANEFUL EFFECTS OF SLAVEHOLDING ON MY DEAR AND GOOD MISTRESS—HOW SHE COMMENCED TEACHING ME TO READ—WHY SHE CEASED TEACHING ME—CLOUDS GATHERING OVER MY BRIGHT PROSPECTS—MASTER AULD'S EXPOSITION OF THE TRUE PHILOSOPHY OF SLAVERY—CITY SLAVES—PLANTATION SLAVES—THE CONTRAST—EXCEPTIONS—MR. HAMILTON'S TWO SLAVES, HENRIETTA AND MARY—MRS. HAMILTON'S CRUEL TREATMENT OF THEM—THE PITEOUS ASPECT THEY PRESENTED—NO POWER MUST COME BETWEEN THE SLAVE AND THE SLAVEHOLDER.

Once in Baltimore, with hard brick pavements under my feet, which almost raised blisters, by their very heat, for it was in the height of summer; walled in on all sides by towering brick buildings; with troops of hostile boys ready to pounce upon me at every street corner; with new and strange objects glaring upon me at every step, and with startling sounds reaching my ears from all directions, I for a time thought that, after all, the home plantation was a more desirable place of residence than my home on Alliciana street, in Baltimore. My country eyes and ears were confused and bewildered here; but the boys were my chief trouble. They chased me, and called me _"Eastern Shore man,"_ till really I almost wished myself back on the Eastern Shore. I had to undergo a sort of moral acclimation, and when that was over, I did much better. My new mistress happily proved to be all she _seemed_ to be, when, with her husband, she met me at the door, with a most beaming, benignant countenance. She was, naturally, of an excellent disposition, kind, gentle and cheerful. The supercilious contempt for the rights and feelings of the slave, and the petulance and bad humor which generally characterize slaveholding ladies, were all quite absent from kind "Miss" Sophia's manner and bearing toward me. She had, in truth, never been a slaveholder, but had—a thing quite unusual in the south—depended almost entirely upon her own industry for a living. To this fact the dear lady, no doubt, owed the excellent preservation of her natural goodness of heart, for slavery can change a saint into a sinner, and an angel into a demon. I hardly knew how to behave toward "Miss Sopha," as I used to call Mrs. Hugh Auld. I had been treated as a _pig_ on the plantation; I was treated as a _child_ now. I could not even approach her as I had formerly approached Mrs. Thomas Auld. How could I hang down my head, and speak with bated breath, when there was no pride to scorn me, no coldness to repel me, and no hatred to inspire me with fear? I therefore soon learned to regard her as something more akin to a mother, than a slaveholding mistress. The crouching servility of a slave, usually so acceptable a quality to the haughty slaveholder, was not understood nor desired by this gentle woman. So far from deeming it impudent in a slave to look her straight in the face, as some slaveholding ladies do, she seemed ever to say, "look up, child; don't be afraid; see, I am full of kindness and good will toward you." The hands belonging to Col. Lloyd's sloop, esteemed it a great privilege to be the bearers of parcels or messages to my new mistress; for whenever they came, they were sure of a most kind and pleasant reception. If little Thomas was her son, and her most dearly beloved child, she, for a time, at least, made me something like his half-brother in her affections. If dear Tommy was exalted to a place on his mother's knee, "Feddy" was honored by a place at his mother's side. Nor did he lack the caressing strokes of her gentle hand, to convince him that, though _motherless_, he was not _friendless_. Mrs. Auld was not only a kind-hearted woman, but she was remarkably pious; frequent in her attendance of public worship, much given to reading the bible, and to chanting hymns of praise, when alone. Mr. Hugh Auld was altogether a different character. He cared very little about religion, knew more of the world, and was more of the world, than his wife. He set out, doubtless to be—as the world goes—a respectable man, and to get on by becoming a successful ship builder, in that city of ship building. This was his ambition, and it fully occupied him. I was, of course, of very little consequence to him, compared with what I was to good Mrs. Auld; and, when he smiled upon me, as he sometimes did, the smile was borrowed from his lovely wife, and, like all borrowed light, was transient, and vanished with the source whence it was derived. While I must characterize Master Hugh as being a very sour man, and of forbidding appearance, it is due to him to acknowledge, that he was never very cruel to me, according to the notion of cruelty in Maryland. The first year or two which I spent in his house, he left me almost exclusively to the management of his wife. She was

my law-giver. In hands so tender as hers, and in the absence of the cruelties of the plantation, I became, both physically and mentally, much more sensitive to good and ill treatment; and, perhaps, suffered more from a frown from my mistress, than I formerly did from a cuff at the hands of Aunt Katy. Instead of the cold, damp floor of my old master's kitchen, I found myself on carpets; for the corn bag in winter, I now had a good straw bed, well furnished with covers; for the coarse corn-meal in the morning, I now had good bread, and mush occasionally; for my poor tow-lien shirt, reaching to my knees, I had good, clean clothes. I was really well off. My employment was to run errands, and to take care of Tommy; to prevent his getting in the way of carriages, and to keep him out of harm's way generally. Tommy, and I, and his mother, got on swimmingly together, for a time. I say _for a time_, because the fatal poison of irresponsible power, and the natural influence of slavery customs, were not long in making a suitable impression on the gentle and loving disposition of my excellent mistress. At first, Mrs. Auld evidently regarded me simply as a child, like any other child; she had not come to regard me as _property_. This latter thought was a thing of conventional growth. The first was natural and spontaneous. A noble nature, like hers, could not, instantly, be wholly perverted; and it took several years to change the natural sweetness of her temper into fretful bitterness. In her worst estate, however, there were, during the first seven years I lived with her, occasional returns of her former kindly disposition.

The frequent hearing of my mistress reading the bible for she often read aloud when her husband was absent soon awakened my curiosity in respect to this _mystery_ of reading, and roused in me the desire to learn. Having no fear of my kind mistress before my eyes, (she had then given me no reason to fear,) I frankly asked her to teach me to read; and, without hesitation, the dear woman began the task, and very soon, by her assistance, I was master of the alphabet, and could spell words of three or four letters. My mistress seemed almost as proud of my progress, as if I had been her own child; and, supposing that her husband would be as well pleased, she made no secret of what she was doing for me. Indeed, she exultingly told him of the aptness of her pupil, of her intention to persevere in teaching me, and of the duty which she felt it to teach me, at least to read _the bible_. Here arose the first cloud over my Baltimore prospects, the precursor of drenching rains and chilling blasts.

Master Hugh was amazed at the simplicity of his spouse, and, probably for the first time, he unfolded to her the true philosophy of slavery, and the peculiar rules necessary to be observed by masters and mistresses, in the management of their human chattels. Mr. Auld promptly forbade continuance of her instruction; telling her, in the first place, that the thing itself was unlawful; that it was also unsafe, and could only lead to mischief. To use his own words, further, he said, "if you give a nigger an inch, he will take an ell;" "he should know nothing but the will of his master, and learn to obey it." "if you teach that nigger—speaking of myself—how to read the bible, there will be no keeping him;" "it would forever unfit him for the duties of a slave;" and "as to himself, learning would do him no good, but probably, a great deal of harm—making him disconsolate and unhappy." "If you learn him now to read, he'll want to know how to write; and, this accomplished, he'll be running away with himself." Such was the tenor of Master Hugh's oracular exposition of the true philosophy of training a human chattel; and it must be confessed that he very clearly comprehended the nature and the requirements of the relation of master and slave. His discourse was the first decidedly anti-slavery lecture to which it had been my lot to listen. Mrs. Auld evidently felt the force of his remarks; and, like an obedient wife, began to shape her course in the direction indicated by her husband. The effect of his words, _on me_, was neither slight nor transitory. His iron sentences—cold and harsh—sunk deep into my heart, and stirred up not only my feelings into a sort of rebellion, but awakened within me a slumbering train of vital thought. It was a new and special revelation, dispelling a painful mystery, against which my youthful understanding had struggled, and struggled in vain, to wit: the _white_ man's power to perpetuate the enslavement of the _black_ man. "Very well," thought I; "knowledge unfits a child to be a slave." I instinctively assented to the proposition; and from that moment I understood the direct pathway from slavery to freedom. This was just what I needed; and I got it at a time, and from a source, whence I least expected it. I was saddened at the thought of losing the assistance of my kind mistress; but the information, so instantly derived, to some extent compensated me for the loss I had sustained in this direction. Wise as Mr. Auld was, he evidently underrated my comprehension, and had little idea of the use to which I was capable of putting the impressive lesson he was giving to his wife. _He_ wanted me to be _a slave;_ I had already voted against that on the home plantation of Col. Lloyd. That which he most loved I most hated; and the very determination which he expressed to keep me in ignorance, only rendered me the more resolute in seeking intelligence. In learning to read, therefore, I am not sure that I do not owe quite as much to the opposition of my master, as to the kindly assistance of my amiable mistress. I acknowledge the benefit rendered me by the one, and by the other; believing, that but for my mistress, I might have grown up in ignorance.

I had resided but a short time in Baltimore, before I observed a marked difference in the manner of treating slaves, generally, from which I had witnessed in that isolated and out-of-the-way part of the country where I began life. A city slave is almost a free citizen, in Baltimore, compared with a slave on Col. Lloyd's plantation. He is much better fed and clothed, is less dejected in his appearance, and enjoys privileges altogether unknown to the whip-driven slave on the plantation. Slavery dislikes a dense

population, in which there is a majority of non-slaveholders. The general sense of decency that must pervade such a population, does much to check and prevent those outbreaks of atrocious cruelty, and those dark crimes without a name, almost openly perpetrated on the plantation. He is a desperate slaveholder who will shock the humanity of his non-slaveholding neighbors, by the cries of the lacerated slaves; and very few in the city are willing to incur the odium of being cruel masters. I found, in Baltimore, that no man was more odious to the white, as well as to the colored people, than he, who had the reputation of starving his slaves. Work them, flog them, if need be, but don't starve them. These are, however, some painful exceptions to this rule. While it is quite true that most of the slaveholders in Baltimore feed and clothe their slaves well, there are others who keep up their country cruelties in the city.

An instance of this sort is furnished in the case of a family who lived directly opposite to our house, and were named Hamilton. Mrs. Hamilton owned two slaves. Their names were Henrietta and Mary. They had always been house slaves. One was aged about twenty-two, and the other about fourteen. They were a fragile couple by nature, and the treatment they received was enough to break down the constitution of a horse. Of all the dejected, emaciated, mangled and excoriated creatures I ever saw, those two girls—in the refined, church going and Christian city of Baltimore were the most deplorable. Of stone must that heart be made, that could look upon Henrietta and Mary, without being sickened to the core with sadness. Especially was Mary a heart-sickening object. Her head, neck and shoulders, were literally cut to pieces. I have frequently felt her head, and found it nearly covered over with festering sores, caused by the lash of her cruel mistress. I do not know that her master ever whipped her, but I have often been an eye witness of the revolting and brutal inflictions by Mrs. Hamilton; and what lends a deeper shade to this woman's conduct, is the fact, that, almost in the very moments of her shocking outrages of humanity and decency, she would charm you by the sweetness of her voice and her seeming piety. She used to sit in a large rocking chair, near the middle of the room, with a heavy cowskin, such as I have elsewhere described; and I speak within the truth when I say, that these girls seldom passed that chair, during the day, without a blow from that cowskin, either upon their bare arms, or upon their shoulders. As they passed her, she would draw her cowskin and give them a blow, saying, _"move faster, you black jip!"_ and, again, _"take that, you black jip!"_ continuing, _"if you don't move faster, I will give you more."_ Then the lady would go on, singing her sweet hymns, as though her _righteous_ soul were sighing for the holy realms of paradise.

Added to the cruel lashings to which these poor slave-girls were subjected—enough in themselves to crush the spirit of men—they were, really, kept nearly half starved; they seldom knew what it was to eat a full meal, except when they got it in the kitchens of neighbors, less mean and stingy than the psalm-singing Mrs. Hamilton. I have seen poor Mary contending for the offal, with the pigs in the street. So much was the poor girl pinched, kicked, cut and pecked to pieces, that the boys in the street knew her only by the name of _"pecked,"_ a name derived from the scars and blotches on her neck, head and shoulders.

It is some relief to this picture of slavery in Baltimore, to say—what is but the simple truth—that Mrs. Hamilton's treatment of her slaves was generally condemned, as disgraceful and shocking; but while I say this, it must also be remembered, that the very parties who censured the cruelty of Mrs. Hamilton, would have condemned and promptly punished any attempt to interfere with Mrs. Hamilton's _right_ to cut and slash her slaves to pieces. There must be no force between the slave and the slaveholder, to restrain the power of the one, and protect the weakness of the other; and the cruelty of Mrs. Hamilton is as justly chargeable to the upholders of the slave system, as drunkenness is chargeable on those who, by precept and example, or by indifference, uphold the drinking system.

CHAPTER XI. _"A Change Came O'er the Spirit of My Dream"_

HOW I LEARNED TO READ—MY MISTRESS—HER SLAVEHOLDING DUTIES—THEIR DEPLORABLE EFFECTS UPON HER ORIGINALLY NOBLE NATURE—THE CONFLICT IN HER MIND—HER FINAL OPPOSITION TO MY LEARNING TO READ—TOO LATE—SHE HAD GIVEN ME THE INCH, I WAS RESOLVED TO TAKE THE ELL—HOW I PURSUED MY EDUCATION—MY TUTORS—HOW I COMPENSATED THEM—WHAT PROGRESS I MADE—SLAVERY—WHAT I HEARD SAID ABOUT IT—THIRTEEN YEARS OLD—THE _Columbian Orator_—A RICH SCENE—A DIALOGUE—SPEECHES OF CHATHAM, SHERIDAN, PITT AND FOX—KNOWLEDGE EVER INCREASING—MY EYES OPENED—LIBERTY—HOW I PINED FOR IT—MY SADNESS—THE DISSATISFACTION OF MY POOR MISTRESS—MY HATRED OF SLAVERY—ONE UPAS TREE OVERSHADOWED US BOTH.

I lived in the family of Master Hugh, at Baltimore, seven years, during which time—as the almanac makers say of the weather—my condition was variable. The most interesting feature of my history here, was my learning to read and write, under somewhat marked

disadvantages. In attaining this knowledge, I was compelled to resort to indirections by no means congenial to my nature, and which were really humiliating to me. My mistress—who, as the reader has already seen, had begun to teach me was suddenly checked in her benevolent design, by the strong advice of her husband. In faithful compliance with this advice, the good lady had not only ceased to instruct me, herself, but had set her face as a flint against my learning to read by any means. It is due, however, to my mistress to say, that she did not adopt this course in all its stringency at the first. She either thought it unnecessary, or she lacked the depravity indispensable to shutting me up in mental darkness. It was, at least, necessary for her to have some training, and some hardening, in the exercise of the slaveholder's prerogative, to make her equal to forgetting my human nature and character, and to treating me as a thing destitute of a moral or an intellectual nature. Mrs. Auld—my mistress—was, as I have said, a most kind and tender-hearted woman; and, in the humanity of her heart, and the simplicity of her mind, she set out, when I first went to live with her, to treat me as she supposed one human being ought to treat another.

It is easy to see, that, in entering upon the duties of a slaveholder, some little experience is needed. Nature has done almost nothing to prepare men and women to be either slaves or slaveholders. Nothing but rigid training, long persisted in, can perfect the character of the one or the other. One cannot easily forget to love freedom; and it is as hard to cease to respect that natural love in our fellow creatures. On entering upon the career of a slaveholding mistress, Mrs. Auld was singularly deficient; nature, which fits nobody for such an office, had done less for her than any lady I had known. It was no easy matter to induce her to think and to feel that the curly-headed boy, who stood by her side, and even leaned on her lap; who was loved by little Tommy, and who loved little Tommy in turn; sustained to her only the relation of a chattel. I was _more_ than that, and she felt me to be more than that. I could talk and sing; I could laugh and weep; I could reason and remember; I could love and hate. I was human, and she, dear lady, knew and felt me to be so. How could she, then, treat me as a brute, without a mighty struggle with all the noble powers of her own soul. That struggle came, and the will and power of the husband was victorious. Her noble soul was overthrown; but, he that overthrew it did not, himself, escape the consequences. He, not less than the other parties, was injured in his domestic peace by the fall.

When I went into their family, it was the abode of happiness and contentment. The mistress of the house was a model of affection and tenderness. Her fervent piety and watchful uprightness made it impossible to see her without thinking and feeling—"_that woman is a Christian_." There was no sorrow nor suffering for which she had not a tear, and there was no innocent joy for which she did not a smile. She had bread for the hungry, clothes for the naked, and comfort for every mourner that came within her reach. Slavery soon proved its ability to divest her of these excellent qualities, and her home of its early happiness. Conscience cannot stand much violence. Once thoroughly broken down, _who_ is he that can repair the damage? It may be broken toward the slave, on Sunday, and toward the master on Monday. It cannot endure such shocks. It must stand entire, or it does not stand at all. If my condition waxed bad, that of the family waxed not better. The first step, in the wrong direction, was the violence done to nature and to conscience, in arresting the benevolence that would have enlightened my young mind. In ceasing to instruct me, she must begin to justify herself _to_ herself; and, once consenting to take sides in such a debate, she was riveted to her position. One needs very little knowledge of moral philosophy, to see _where_ my mistress now landed. She finally became even more violent in her opposition to my learning to read, than was her husband himself. She was not satisfied with simply doing as _well_ as her husband had commanded her, but seemed resolved to better his instruction. Nothing appeared to make my poor mistress—after her turning toward the downward path—more angry, than seeing me, seated in some nook or corner, quietly reading a book or a newspaper. I have had her rush at me, with the utmost fury, and snatch from my hand such newspaper or book, with something of the wrath and consternation which a traitor might be supposed to feel on being discovered in a plot by some dangerous spy.

Mrs. Auld was an apt woman, and the advice of her husband, and her own experience, soon demonstrated, to her entire satisfaction, that education and slavery are incompatible with each other. When this conviction was thoroughly established, I was most narrowly watched in all my movements. If I remained in a separate room from the family for any considerable length of time, I was sure to be suspected of having a book, and was at once called upon to give an account of myself. All this, however, was entirely _too late_. The first, and never to be retraced, step had been taken. In teaching me the alphabet, in the days of her simplicity and kindness, my mistress had given me the _"inch,"_ and now, no ordinary precaution could prevent me from taking the _"ell."_

Seized with a determination to learn to read, at any cost, I hit upon many expedients to accomplish the desired end. The plea which I mainly adopted, and the one by which I was most successful, was that of using my young white playmates, with whom I met in the streets as teachers. I used to carry, almost constantly, a copy of Webster's spelling book in my pocket; and, when sent of errands, or when play time was allowed me, I would step, with my young friends, aside, and take a lesson in spelling. I generally paid my _tuition fee_ to the boys, with bread, which I also carried in my pocket. For a single biscuit, any of my hungry little comrades would

give me a lesson more valuable to me than bread. Not every one, however, demanded this consideration, for there were those who took pleasure in teaching me, whenever I had a chance to be taught by them. I am strongly tempted to give the names of two or three of those little boys, as a slight testimonial of the gratitude and affection I bear them, but prudence forbids; not that it would injure me, but it might, possibly, embarrass them; for it is almost an unpardonable offense to do any thing, directly or indirectly, to promote a slave's freedom, in a slave state. It is enough to say, of my warm-hearted little play fellows, that they lived on Philpot street, very near Durgin & Bailey's shipyard.

Although slavery was a delicate subject, and very cautiously talked about among grown up people in Maryland, I frequently talked about it—and that very freely—with the white boys. I would, sometimes, say to them, while seated on a curb stone or a cellar door, "I wish I could be free, as you will be when you get to be men." "You will be free, you know, as soon as you are twenty-one, and can go where you like, but I am a slave for life. Have I not as good a right to be free as you have?" Words like these, I observed, always troubled them; and I had no small satisfaction in wringing from the boys, occasionally, that fresh and bitter condemnation of slavery, that springs from nature, unseared and unperverted. Of all consciences let me have those to deal with which have not been bewildered by the cares of life. I do not remember ever to have met with a _boy_, while I was in slavery, who defended the slave system; but I have often had boys to console me, with the hope that something would yet occur, by which I might be made free. Over and over again, they have told me, that "they believed I had as good a right to be free as _they_ had;" and that "they did not believe God ever made any one to be a slave." The reader will easily see, that such little conversations with my play fellows, had no tendency to weaken my love of liberty, nor to render me contented with my condition as a slave.

When I was about thirteen years old, and had succeeded in learning to read, every increase of knowledge, especially respecting the FREE STATES, added something to the almost intolerable burden of the thought—I AM A SLAVE FOR LIFE. To my bondage I saw no end. It was a terrible reality, and I shall never be able to tell how sadly that thought chafed my young spirit. Fortunately, or unfortunately, about this time in my life, I had made enough money to buy what was then a very popular school book, viz: the _Columbian Orator_. I bought this addition to my library, of Mr. Knight, on Thames street, Fell's Point, Baltimore, and paid him fifty cents for it. I was first led to buy this book, by hearing some little boys say they were going to learn some little pieces out of it for the Exhibition. This volume was, indeed, a rich treasure, and every opportunity afforded me, for a time, was spent in diligently perusing it. Among much other interesting matter, that which I had perused and reperused with unflagging satisfaction, was a short dialogue between a master and his slave. The slave is represented as having been recaptured, in a second attempt to run away; and the master opens the dialogue with an upbraiding speech, charging the slave with ingratitude, and demanding to know what he has to say in his own defense. Thus upbraided, and thus called upon to reply, the slave rejoins, that he knows how little anything that he can say will avail, seeing that he is completely in the hands of his owner; and with noble resolution, calmly says, "I submit to my fate." Touched by the slave's answer, the master insists upon his further speaking, and recapitulates the many acts of kindness which he has performed toward the slave, and tells him he is permitted to speak for himself. Thus invited to the debate, the quondam slave made a spirited defense of himself, and thereafter the whole argument, for and against slavery, was brought out. The master was vanquished at every turn in the argument; and seeing himself to be thus vanquished, he generously and meekly emancipates the slave, with his best wishes for his prosperity. It is scarcely neccessary(sic) to say, that a dialogue, with such an origin, and such an ending—read when the fact of my being a slave was a constant burden of grief—powerfully affected me; and I could not help feeling that the day might come, when the well-directed answers made by the slave to the master, in this instance, would find their counterpart in myself.

This, however, was not all the fanaticism which I found in this _Columbian Orator_. I met there one of Sheridan's mighty speeches, on the subject of Catholic Emancipation, Lord Chatham's speech on the American war, and speeches by the great William Pitt and by Fox. These were all choice documents to me, and I read them, over and over again, with an interest that was ever increasing, because it was ever gaining in intelligence; for the more I read them, the better I understood them. The reading of these speeches added much to my limited stock of language, and enabled me to give tongue to many interesting thoughts, which had frequently flashed through my soul, and died away for want of utterance. The mighty power and heart-searching directness of truth, penetrating even the heart of a slaveholder, compelling him to yield up his earthly interests to the claims of eternal justice, were finely illustrated in the dialogue, just referred to; and from the speeches of Sheridan, I got a bold and powerful denunciation of oppression, and a most brilliant vindication of the rights of man. Here was, indeed, a noble acquisition. If I ever wavered under the consideration, that the Almighty, in some way, ordained slavery, and willed my enslavement for his own glory, I wavered no longer. I had now penetrated the secret of all slavery and oppression, and had ascertained their true foundation to be in the pride, the power and the avarice of man. The dialogue and the speeches were all redolent of the principles of liberty, and poured floods of light on the nature and character of slavery. With a book of this kind in my hand, my own human nature, and the facts of my

experience, to help me, I was equal to a contest with the religious advocates of slavery, whether among the whites or among the colored people, for blindness, in this matter, is not confined to the former. I have met many religious colored people, at the south, who are under the delusion that God requires them to submit to slavery, and to wear their chains with meekness and humility. I could entertain no such nonsense as this; and I almost lost my patience when I found any colored man weak enough to believe such stuff. Nevertheless, the increase of knowledge was attended with bitter, as well as sweet results. The more I read, the more I was led to abhor and detest slavery, and my enslavers. “Slaveholders,” thought I, “are only a band of successful robbers, who left their homes and went into Africa for the purpose of stealing and reducing my people to slavery.” I loathed them as the meanest and the most wicked of men. As I read, behold! the very discontent so graphically predicted by Master Hugh, had already come upon me. I was no longer the light-hearted, gleesome boy, full of mirth and play, as when I landed first at Baltimore. Knowledge had come; light had penetrated the moral dungeon where I dwelt; and, behold! there lay the bloody whip, for my back, and here was the iron chain; and my good, _kind master_, he was the author of my situation. The revelation haunted me, stung me, and made me gloomy and miserable. As I writhed under the sting and torment of this knowledge, I almost envied my fellow slaves their stupid contentment. This knowledge opened my eyes to the horrible pit, and revealed the teeth of the frightful dragon that was ready to pounce upon me, but it opened no way for my escape. I have often wished myself a beast, or a bird—anything, rather than a slave. I was wretched and gloomy, beyond my ability to describe. I was too thoughtful to be happy. It was this everlasting thinking which distressed and tormented me; and yet there was no getting rid of the subject of my thoughts. All nature was redolent of it. Once awakened by the silver trump of knowledge, my spirit was roused to eternal wakefulness. Liberty! the inestimable birthright of every man, had, for me, converted every object into an asserter of this great right. It was heard in every sound, and beheld in every object. It was ever present, to torment me with a sense of my wretched condition. The more beautiful and charming were the smiles of nature, the more horrible and desolate was my condition. I saw nothing without seeing it, and I heard nothing without hearing it. I do not exaggerate, when I say, that it looked from every star, smiled in every calm, breathed in every wind, and moved in every storm.

I have no doubt that my state of mind had something to do with the change in the treatment adopted, by my once kind mistress toward me. I can easily believe, that my leaden, downcast, and discontented look, was very offensive to her. Poor lady! She did not know my trouble, and I dared not tell her. Could I have freely made her acquainted with the real state of my mind, and given her the reasons therefor, it might have been well for both of us. Her abuse of me fell upon me like the blows of the false prophet upon his ass; she did not know that an _angel_ stood in the way; and—such is the relation of master and slave I could not tell her. Nature had made us _friends;_ slavery made us _enemies_. My interests were in a direction opposite to hers, and we both had our private thoughts and plans. She aimed to keep me ignorant; and I resolved to know, although knowledge only increased my discontent. My feelings were not the result of any marked cruelty in the treatment I received; they sprung from the consideration of my being a slave at all. It was _slavery_—not its mere _incidents_—that I hated. I had been cheated. I saw through the attempt to keep me in ignorance; I saw that slaveholders would have gladly made me believe that they were merely acting under the authority of God, in making a slave of me, and in making slaves of others; and I treated them as robbers and deceivers. The feeding and clothing me well, could not atone for taking my liberty from me. The smiles of my mistress could not remove the deep sorrow that dwelt in my young bosom. Indeed, these, in time, came only to deepen my sorrow. She had changed; and the reader will see that I had changed, too. We were both victims to the same overshadowing evil—_she_, as mistress, I, as slave. I will not censure her harshly; she cannot censure me, for she knows I speak but the truth, and have acted in my opposition to slavery, just as she herself would have acted, in a reverse of circumstances.

CHAPTER XII. _Religious Nature Awakened_

ABOLITIONISTS SPOKEN OF—MY EAGERNESS TO KNOW WHAT THIS WORD MEANT—MY CONSULTATION OF THE DICTIONARY—INCENDIARY INFORMATION—HOW AND WHERE DERIVED—THE ENIGMA SOLVED—NATHANIEL TURNER’S INSURRECTION—THE CHOLERA—RELIGION—FIRST AWAKENED BY A METHODIST MINISTER NAMED HANSON—MY DEAR AND GOOD OLD COLORED FRIEND, LAWSON—HIS CHARACTER AND OCCUPATION—HIS INFLUENCE OVER ME—OUR MUTUAL ATTACHMENT—THE COMFORT I DERIVED FROM HIS TEACHING—NEW HOPES AND ASPIRATIONS—HEAVENLY LIGHT AMIDST EARTHLY DARKNESS—THE TWO IRISHMEN ON THE WHARF—THEIR CONVERSATION—HOW I LEARNED TO WRITE—WHAT WERE MY AIMS.

Whilst in the painful state of mind described in the foregoing chapter, almost regretting my very existence, because doomed to a life of bondage, so goaded and so wretched, at times, that I was even tempted to destroy my own life, I was keenly sensitive and eager

to know any, and every thing that transpired, having any relation to the subject of slavery. I was all ears, all eyes, whenever the words _slave, slavery_, dropped from the lips of any white person, and the occasions were not unfrequent when these words became leading ones, in high, social debate, at our house. Every little while, I could hear Master Hugh, or some of his company, speaking with much warmth and excitement about _“abolitionists.”_ Of _who_ or _what_ these were, I was totally ignorant. I found, however, that whatever they might be, they were most cordially hated and soundly abused by slaveholders, of every grade. I very soon discovered, too, that slavery was, in some sort, under consideration, whenever the abolitionists were alluded to. This made the term a very interesting one to me. If a slave, for instance, had made good his escape from slavery, it was generally alleged, that he had been persuaded and assisted by the abolitionists. If, also, a slave killed his master—as was sometimes the case—or struck down his overseer, or set fire to his master’s dwelling, or committed any violence or crime, out of the common way, it was certain to be said, that such a crime was the legitimate fruits of the abolition movement. Hearing such charges often repeated, I, naturally enough, received the impression that abolition—whatever else it might be—could not be unfriendly to the slave, nor very friendly to the slaveholder. I therefore set about finding out, if possible, _who_ and _what_ the abolitionists were, and _why_ they were so obnoxious to the slaveholders. The dictionary afforded me very little help. It taught me that abolition was the “act of abolishing;” but it left me in ignorance at the very point where I most wanted information—and that was, as to the _thing_ to be abolished. A city newspaper, the _Baltimore American_, gave me the incendiary information denied me by the dictionary. In its columns I found, that, on a certain day, a vast number of petitions and memorials had been presented to congress, praying for the abolition of slavery in the District of Columbia, and for the abolition of the slave trade between the states of the Union. This was enough. The vindictive bitterness, the marked caution, the studied reverse, and the cumbrous ambiguity, practiced by our white folks, when alluding to this subject, was now fully explained. Ever, after that, when I heard the words “abolition,” or “abolition movement,” mentioned, I felt the matter one of a personal concern; and I drew near to listen, when I could do so, without seeming too solicitous and prying. There was HOPE in those words. Ever and anon, too, I could see some terrible denunciation of slavery, in our papers—copied from abolition papers at the north—and the injustice of such denunciation commented on. These I read with avidity. I had a deep satisfaction in the thought, that the rascality of slaveholders was not concealed from the eyes of the world, and that I was not alone in abhorring the cruelty and brutality of slavery. A still deeper train of thought was stirred. I saw that there was _fear_, as well as _rage_, in the manner of speaking of the abolitionists. The latter, therefore, I was compelled to regard as having some power in the country; and I felt that they might, possibly, succeed in their designs. When I met with a slave to whom I deemed it safe to talk on the subject, I would impart to him so much of the mystery as I had been able to penetrate. Thus, the light of this grand movement broke in upon my mind, by degrees; and I must say, that, ignorant as I then was of the philosophy of that movement, I believe in it from the first—and I believed in it, partly, because I saw that it alarmed the consciences of slaveholders. The insurrection of Nathaniel Turner had been quelled, but the alarm and terror had not subsided. The cholera was on its way, and the thought was present, that God was angry with the white people because of their slaveholding wickedness, and, therefore, his judgments were abroad in the land. It was impossible for me not to hope much from the abolition movement, when I saw it supported by the Almighty, and armed with DEATH!

Previous to my contemplation of the anti-slavery movement, and its probable results, my mind had been seriously awakened to the subject of religion. I was not more than thirteen years old, when I felt the need of God, as a father and protector. My religious nature was awakened by the preaching of a white Methodist minister, named Hanson. He thought that all men, great and small, bond and free, were sinners in the sight of God; that they were, by nature, rebels against His government; and that they must repent of their sins, and be reconciled to God, through Christ. I cannot say that I had a very distinct notion of what was required of me; but one thing I knew very well—I was wretched, and had no means of making myself otherwise. Moreover, I knew that I could pray for light. I consulted a good colored man, named Charles Johnson; and, in tones of holy affection, he told me to pray, and what to pray for. I was, for weeks, a poor, brokenhearted mourner, traveling through the darkness and misery of doubts and fears. I finally found that change of heart which comes by “casting all one’s care” upon God, and by having faith in Jesus Christ, as the Redeemer, Friend, and Savior of those who diligently seek Him.

After this, I saw the world in a new light. I seemed to live in a new world, surrounded by new objects, and to be animated by new hopes and desires. I loved all mankind—slaveholders not excepted; though I abhorred slavery more than ever. My great concern was, now, to have the world converted. The desire for knowledge increased, and especially did I want a thorough acquaintance with the contents of the bible. I have gathered scattered pages from this holy book, from the filthy street gutters of Baltimore, and washed and dried them, that in the moments of my leisure, I might get a word or two of wisdom from them. While thus religiously seeking knowledge, I became acquainted with a good old colored man, named Lawson. A more devout man than he, I never saw. He drove a dray for Mr. James Ramsey, the owner of a rope-walk on Fell’s Point, Baltimore. This man not only prayed three time a

day, but he prayed as he walked through the streets, at his work—on his dray everywhere. His life was a life of prayer, and his words (when he spoke to his friends,) were about a better world. Uncle Lawson lived near Master Hugh's house; and, becoming deeply attached to the old man, I went often with him to prayer-meeting, and spent much of my leisure time with him on Sunday. The old man could read a little, and I was a great help to him, in making out the hard words, for I was a better reader than he. I could teach him _"the letter,"_ but he could teach me _"the spirit;"_ and high, refreshing times we had together, in singing, praying and glorifying God. These meetings with Uncle Lawson went on for a long time, without the knowledge of Master Hugh or my mistress. Both knew, however, that I had become religious, and they seemed to respect my conscientious piety. My mistress was still a professor of religion, and belonged to class. Her leader was no less a person than the Rev. Beverly Waugh, the presiding elder, and now one of the bishops of the Methodist Episcopal church. Mr. Waugh was then stationed over Wilk street church. I am careful to state these facts, that the reader may be able to form an idea of the precise influences which had to do with shaping and directing my mind.

In view of the cares and anxieties incident to the life she was then leading, and, especially, in view of the separation from religious associations to which she was subjected, my mistress had, as I have before stated, become lukewarm, and needed to be looked up by her leader. This brought Mr. Waugh to our house, and gave me an opportunity to hear him exhort and pray. But my chief instructor, in matters of religion, was Uncle Lawson. He was my spiritual father; and I loved him intensely, and was at his house every chance I got.

This pleasure was not long allowed me. Master Hugh became averse to my going to Father Lawson's, and threatened to whip me if I ever went there again. I now felt myself persecuted by a wicked man; and I _would_ go to Father Lawson's, notwithstanding the threat. The good old man had told me, that the "Lord had a great work for me to do;" and I must prepare to do it; and that he had been shown that I must preach the gospel. His words made a deep impression on my mind, and I verily felt that some such work was before me, though I could not see _how_ I should ever engage in its performance. "The good Lord," he said, "would bring it to pass in his own good time," and that I must go on reading and studying the scriptures. The advice and the suggestions of Uncle Lawson, were not without their influence upon my character and destiny. He threw my thoughts into a channel from which they have never entirely diverged. He fanned my already intense love of knowledge into a flame, by assuring me that I was to be a useful man in the world. When I would say to him, "How can these things be and what can _I_ do?" his simple reply was, _"Trust in the Lord."_ When I told him that "I was a slave, and a slave FOR LIFE," he said, "the Lord can make you free, my dear. All things are possible with him, only _have faith in God."_ "Ask, and it shall be given." "If you want liberty," said the good old man, "ask the Lord for it, _in faith_, AND HE WILL GIVE IT TO YOU."

Thus assured, and cheered on, under the inspiration of hope, I worked and prayed with a light heart, believing that my life was under the guidance of a wisdom higher than my own. With all other blessings sought at the mercy seat, I always prayed that God would, of His great mercy, and in His own good time, deliver me from my bondage.

I went, one day, on the wharf of Mr. Waters; and seeing two Irishmen unloading a large scow of stone, or ballast I went on board, unasked, and helped them. When we had finished the work, one of the men came to me, aside, and asked me a number of questions, and among them, if I were a slave. I told him "I was a slave, and a slave for life." The good Irishman gave his shoulders a shrug, and seemed deeply affected by the statement. He said, "it was a pity so fine a little fellow as myself should be a slave for life." They both had much to say about the matter, and expressed the deepest sympathy with me, and the most decided hatred of slavery. They went so far as to tell me that I ought to run away, and go to the north; that I should find friends there, and that I would be as free as anybody. I, however, pretended not to be interested in what they said, for I feared they might be treacherous. White men have been known to encourage slaves to escape, and then—to get the reward—they have kidnapped them, and returned them to their masters. And while I mainly inclined to the notion that these men were honest and meant me no ill, I feared it might be otherwise. I nevertheless remembered their words and their advice, and looked forward to an escape to the north, as a possible means of gaining the liberty for which my heart panted. It was not my enslavement, at the then present time, that most affected me; the being a slave _for life_, was the saddest thought. I was too young to think of running away immediately; besides, I wished to learn how to write, before going, as I might have occasion to write my own pass. I now not only had the hope of freedom, but a foreshadowing of the means by which I might, some day, gain that inestimable boon. Meanwhile, I resolved to add to my educational attainments the art of writing.

After this manner I began to learn to write: I was much in the ship yard—Master Hugh's, and that of Durgan & Bailey—and I observed that the carpenters, after hewing and getting a piece of timber ready for use, wrote on it the initials of the name of that part of the ship for which it was intended. When, for instance, a piece of timber was ready for the starboard side, it was marked with

a capital “S.” A piece for the larboard side was marked “L;” larboard forward, “L. F.;” larboard aft, was marked “L. A.;” starboard aft, “S. A.;” and starboard forward “S. F.” I soon learned these letters, and for what they were placed on the timbers.

My work was now, to keep fire under the steam box, and to watch the ship yard while the carpenters had gone to dinner. This interval gave me a fine opportunity for copying the letters named. I soon astonished myself with the ease with which I made the letters; and the thought was soon present, “if I can make four, I can make more.” But having made these easily, when I met boys about Bethel church, or any of our play-grounds, I entered the lists with them in the art of writing, and would make the letters which I had been so fortunate as to learn, and ask them to “beat that if they could.” With playmates for my teachers, fences and pavements for my copy books, and chalk for my pen and ink, I learned the art of writing. I, however, afterward adopted various methods of improving my hand. The most successful, was copying the _italics_ in Webster’s spelling book, until I could make them all without looking on the book. By this time, my little “Master Tommy” had grown to be a big boy, and had written over a number of copy books, and brought them home. They had been shown to the neighbors, had elicited due praise, and were now laid carefully away. Spending my time between the ship yard and house, I was as often the lone keeper of the latter as of the former. When my mistress left me in charge of the house, I had a grand time; I got Master Tommy’s copy books and a pen and ink, and, in the ample spaces between the lines, I wrote other lines, as nearly like his as possible. The process was a tedious one, and I ran the risk of getting a flogging for marring the highly prized copy books of the oldest son. In addition to those opportunities, sleeping, as I did, in the kitchen loft—a room seldom visited by any of the family—I got a flour barrel up there, and a chair; and upon the head of that barrel I have written (or endeavored to write) copying from the bible and the Methodist hymn book, and other books which had accumulated on my hands, till late at night, and when all the family were in bed and asleep. I was supported in my endeavors by renewed advice, and by holy promises from the good Father Lawson, with whom I continued to meet, and pray, and read the scriptures. Although Master Hugh was aware of my going there, I must say, for his credit, that he never executed his threat to whip me, for having thus, innocently, employed-my leisure time.

CHAPTER XIII. _The Vicissitudes of Slave Life_

DEATH OF OLD MASTER’S SON RICHARD, SPEEDILY FOLLOWED BY THAT OF OLD MASTER—VALUATION AND DIVISION OF ALL THE PROPERTY, INCLUDING THE SLAVES—MY PRESENCE REQUIRED AT HILLSBOROUGH TO BE APPRAISED AND ALLOTTED TO A NEW OWNER—MY SAD PROSPECTS AND GRIEF—PARTING—THE UTTER POWERLESSNESS OF THE SLAVES TO DECIDE THEIR OWN DESTINY—A GENERAL DREAD OF MASTER ANDREW—HIS WICKEDNESS AND CRUELTY—MISS LUCRETIA MY NEW OWNER—MY RETURN TO BALTIMORE—JOY UNDER THE ROOF OF MASTER HUGH—DEATH OF MRS. LUCRETIA—MY POOR OLD GRANDMOTHER—HER SAD FATE—THE LONE COT IN THE WOODS—MASTER THOMAS AULD’S SECOND MARRIAGE—AGAIN REMOVED FROM MASTER HUGH’S—REASONS FOR REGRETTING THE CHANGE—A PLAN OF ESCAPE ENTERTAINED.

I must now ask the reader to go with me a little back in point of time, in my humble story, and to notice another circumstance that entered into my slavery experience, and which, doubtless, has had a share in deepening my horror of slavery, and increasing my hostility toward those men and measures that practically uphold the slave system.

It has already been observed, that though I was, after my removal from Col. Lloyd’s plantation, in _form_ the slave of Master Hugh, I was, in _fact_, and in _law_, the slave of my old master, Capt. Anthony. Very well.

In a very short time after I went to Baltimore, my old master’s youngest son, Richard, died; and, in three years and six months after his death, my old master himself died, leaving only his son, Andrew, and his daughter, Lucretia, to share his estate. The old man died while on a visit to his daughter, in Hillsborough, where Capt. Auld and Mrs. Lucretia now lived. The former, having given up the command of Col. Lloyd’s sloop, was now keeping a store in that town.

Cut off, thus unexpectedly, Capt. Anthony died intestate; and his property must now be equally divided between his two children, Andrew and Lucretia.

The valuation and the division of slaves, among contending heirs, is an important incident in slave life. The character and tendencies of the heirs, are generally well understood among the slaves who are to be divided, and all have their aversions and preferences. But, neither their aversions nor their preferences avail them anything.

On the death of old master, I was immediately sent for, to be valued and divided with the other property. Personally, my concern was, mainly, about my possible removal from the home of Master Hugh, which, after that of my grandmother, was the most endeared to me. But, the whole thing, as a feature of slavery, shocked me. It furnished me anew insight into the unnatural power to which I was subjected. My detestation of slavery, already great, rose with this new conception of its enormity.

That was a sad day for me, a sad day for little Tommy, and a sad day for my dear Baltimore mistress and teacher, when I left for the Eastern Shore, to be valued and divided. We, all three, wept bitterly that day; for we might be parting, and we feared we were parting, forever. No one could tell among which pile of chattels I should be flung. Thus early, I got a foretaste of that painful uncertainty which slavery brings to the ordinary lot of mortals. Sickness, adversity and death may interfere with the plans and purposes of all; but the slave has the added danger of changing homes, changing hands, and of having separations unknown to other men. Then, too, there was the intensified degradation of the spectacle. What an assemblage! Men and women, young and old, married and single; moral and intellectual beings, in open contempt of their humanity, level at a blow with horses, sheep, horned cattle and swine! Horses and men—cattle and women—pigs and children—all holding the same rank in the scale of social existence; and all subjected to the same narrow inspection, to ascertain their value in gold and silver—the only standard of worth applied by slaveholders to slaves! How vividly, at that moment, did the brutalizing power of slavery flash before me! Personality swallowed up in the sordid idea of property! Manhood lost in chattelhood!

After the valuation, then came the division. This was an hour of high excitement and distressing anxiety. Our destiny was now to be _fixed for life_, and we had no more voice in the decision of the question, than the oxen and cows that stood chewing at the haymow. One word from the appraisers, against all preferences or prayers, was enough to sunder all the ties of friendship and affection, and even to separate husbands and wives, parents and children. We were all appalled before that power, which, to human seeming, could bless or blast us in a moment. Added to the dread of separation, most painful to the majority of the slaves, we all had a decided horror of the thought of falling into the hands of Master Andrew. He was distinguished for cruelty and intemperance.

Slaves generally dread to fall into the hands of drunken owners. Master Andrew was almost a confirmed sot, and had already, by his reckless mismanagement and profligate dissipation, wasted a large portion of old master's property. To fall into his hands, was, therefore, considered merely as the first step toward being sold away to the far south. He would spend his fortune in a few years, and his farms and slaves would be sold, we thought, at public outcry; and we should be hurried away to the cotton fields, and rice swamps, of the sunny south. This was the cause of deep consternation.

The people of the north, and free people generally, I think, have less attachment to the places where they are born and brought up, than have the slaves. Their freedom to go and come, to be here and there, as they list, prevents any extravagant attachment to any one particular place, in their case. On the other hand, the slave is a fixture; he has no choice, no goal, no destination; but is pegged down to a single spot, and must take root here, or nowhere. The idea of removal elsewhere, comes, generally, in the shape of a threat, and in punishment of crime. It is, therefore, attended with fear and dread. A slave seldom thinks of bettering his condition by being sold, and hence he looks upon separation from his native place, with none of the enthusiasm which animates the bosoms of young freemen, when they contemplate a life in the far west, or in some distant country where they intend to rise to wealth and distinction. Nor can those from whom they separate, give them up with that cheerfulness with which friends and relations yield each other up, when they feel that it is for the good of the departing one that he is removed from his native place. Then, too, there is correspondence, and there is, at least, the hope of reunion, because reunion is _possible_. But, with the slave, all these mitigating circumstances are wanting. There is no improvement in his condition _probable_,—no correspondence _possible_,—no reunion attainable. His going out into the world, is like a living man going into the tomb, who, with open eyes, sees himself buried out of sight and hearing of wife, children and friends of kindred tie.

In contemplating the likelihoods and possibilities of our circumstances, I probably suffered more than most of my fellow servants. I had known what it was to experience kind, and even tender treatment; they had known nothing of the sort. Life, to them, had been rough and thorny, as well as dark. They had—most of them—lived on my old master's farm in Tuckahoe, and had felt the reign of Mr. Plummer's rule. The overseer had written his character on the living parchment of most of their backs, and left them callous; my back (thanks to my early removal from the plantation to Baltimore) was yet tender. I had left a kind mistress at Baltimore, who was almost a mother to me. She was in tears when we parted, and the probabilities of ever seeing her again, trembling in the balance as they did, could not be viewed without alarm and agony. The thought of leaving that kind mistress forever, and, worse still, of being the slave of Andrew Anthony—a man who, but a few days before the division of the property, had, in my presence, seized my brother Perry by the throat, dashed him on the ground, and with the heel of his boot stamped him on the head, until the blood

gushed from his nose and ears—was terrible! This fiendish proceeding had no better apology than the fact, that Perry had gone to play, when Master Andrew wanted him for some trifling service. This cruelty, too, was of a piece with his general character. After inflicting his heavy blows on my brother, on observing me looking at him with intense astonishment, he said, "_That_ is the way I will serve you, one of these days;" meaning, no doubt, when I should come into his possession. This threat, the reader may well suppose, was not very tranquilizing to my feelings. I could see that he really thirsted to get hold of me. But I was there only for a few days. I had not received any orders, and had violated none, and there was, therefore, no excuse for flogging me.

At last, the anxiety and suspense were ended; and they ended, thanks to a kind Providence, in accordance with my wishes. I fell to the portion of Mrs. Lucretia—the dear lady who bound up my head, when the savage Aunt Katy was adding to my sufferings her bitterest maledictions.

Capt. Thomas Auld and Mrs. Lucretia at once decided on my return to Baltimore. They knew how sincerely and warmly Mrs. Hugh Auld was attached to me, and how delighted Mr. Hugh's son would be to have me back; and, withal, having no immediate use for one so young, they willingly let me off to Baltimore.

I need not stop here to narrate my joy on returning to Baltimore, nor that of little Tommy; nor the tearful joy of his mother; nor the evident saticfaction(sic) of Master Hugh. I was just one month absent from Baltimore, before the matter was decided; and the time really seemed full six months.

One trouble over, and on comes another. The slave's life is full of uncertainty. I had returned to Baltimore but a short time, when the tidings reached me, that my friend, Mrs. Lucretia, who was only second in my regard to Mrs. Hugh Auld, was dead, leaving her husband and only one child—a daughter, named Amanda.

Shortly after the death of Mrs. Lucretia, strange to say, Master Andrew died, leaving his wife and one child. Thus, the whole family of Anthonys was swept away; only two children remained. All this happened within five years of my leaving Col. Lloyd's.

No alteration took place in the condition of the slaves, in consequence of these deaths, yet I could not help feeling less secure, after the death of my friend, Mrs. Lucretia, than I had done during her life. While she lived, I felt that I had a strong friend to plead for me in any emergency. Ten years ago, while speaking of the state of things in our family, after the events just named, I used this language:

Now all the property of my old master, slaves included, was in the hands of strangers—strangers who had nothing to do in accumulating it. Not a slave was left free. All remained slaves, from youngest to oldest. If any one thing in my experience, more than another, served to deepen my conviction of the infernal character of slavery, and to fill me with unutterable loathing of slaveholders, it was their base ingratitude to my poor old grandmother. She had served my old master faithfully from youth to old age. She had been the source of all his wealth; she had peopled his plantation with slaves; she had become a great-grandmother in his service. She had rocked him in infancy, attended him in childhood, served him through life, and at his death wiped from his icy brow the cold death-sweat, and closed his eyes forever. She was nevertheless left a slave—a slave for life—a slave in the hands of strangers; and in their hands she saw her children, her grandchildren, and her great-grandchildren, divided, like so many sheep, without being gratified with the small privilege of a single word, as to their or her own destiny. And, to cap the climax of their base ingratitude and fiendish barbarity, my grandmother, who was now very old, having outlived my old master and all his children, having seen the beginning and end of all of them, and her present owners finding she was of but little value, her frame already racked with the pains of old age, and complete helplessness fast stealing over her once active limbs, they took her to the woods, built her a little hut, put up a little mud-chimney, and then made her welcome to the privilege of supporting herself there in perfect loneliness; thus virtually turning her out to die! If my poor old grandmother now lives, she lives to suffer in utter loneliness; she lives to remember and mourn over the loss of children, the loss of grandchildren, and the loss of great-grandchildren. They are, in the language of the slave's poet, Whittier—

Gone, gone, sold and gone, To the rice swamp dank and lone, Where the slave-whip ceaseless swings, Where the noisome insect stings, Where the fever-demon strews Poison with the falling dews, Where the sickly sunbeams glare Through the hot and misty air:— Gone, gone, sold and gone To the rice swamp dank and lone, From Virginia hills and waters— Woe is me, my stolen daughters!

The hearth is desolate. The children, the unconscious children, who once sang and danced in her presence, are gone. She gropes her way, in the darkness of age, for a drink of water. Instead of the voices of her children, she hears by day the moans of the dove,

and by night the screams of the hideous owl. All is gloom. The grave is at the door. And now, when weighed down by the pains and aches of old age, when the head inclines to the feet, when the beginning and ending of human existence meet, and helpless infancy and painful old age combine together—at this time, this most needful time, the time for the exercise of that tenderness and affection which children only can exercise toward a declining parent—my poor old grandmother, the devoted mother of twelve children, is left all alone, in yonder little hut, before a few dim embers.

Two years after the death of Mrs. Lucretia, Master Thomas married his second wife. Her name was Rowena Hamilton, the eldest daughter of Mr. William Hamilton, a rich slaveholder on the Eastern Shore of Maryland, who lived about five miles from St. Michael's, the then place of my master's residence.

Not long after his marriage, Master Thomas had a misunderstanding with Master Hugh, and, as a means of punishing his brother, he ordered him to send me home.

As the ground of misunderstanding will serve to illustrate the character of southern chivalry, and humanity, I will relate it.

Among the children of my Aunt Milly, was a daughter, named Henny. When quite a child, Henny had fallen into the fire, and burnt her hands so bad that they were of very little use to her. Her fingers were drawn almost into the palms of her hands. She could make out to do something, but she was considered hardly worth the having—of little more value than a horse with a broken leg. This unprofitable piece of human property, ill shapen, and disfigured, Capt. Auld sent off to Baltimore, making his brother Hugh welcome to her services.

After giving poor Henny a fair trial, Master Hugh and his wife came to the conclusion, that they had no use for the crippled servant, and they sent her back to Master Thomas. Thus, the latter took as an act of ingratitude, on the part of his brother; and, as a mark of his displeasure, he required him to send me immediately to St. Michael's, saying, if he cannot keep _"Hen,"_ he shall not have _"Fred."_

Here was another shock to my nerves, another breaking up of my plans, and another severance of my religious and social alliances. I was now a big boy. I had become quite useful to several young colored men, who had made me their teacher. I had taught some of them to read, and was accustomed to spend many of my leisure hours with them. Our attachment was strong, and I greatly dreaded the separation. But regrets, especially in a slave, are unavailing. I was only a slave; my wishes were nothing, and my happiness was the sport of my masters.

My regrets at now leaving Baltimore, were not for the same reasons as when I before left that city, to be valued and handed over to my proper owner. My home was not now the pleasant place it had formerly been. A change had taken place, both in Master Hugh, and in his once pious and affectionate wife. The influence of brandy and bad company on him, and the influence of slavery and social isolation upon her, had wrought disastrously upon the characters of both. Thomas was no longer "little Tommy," but was a big boy, and had learned to assume the airs of his class toward me. My condition, therefore, in the house of Master Hugh, was not, by any means, so comfortable as in former years. My attachments were now outside of our family. They were felt to those to whom I _imparted_ instruction, and to those little white boys from whom I _received_ instruction. There, too, was my dear old father, the pious Lawson, who was, in christian graces, the very counterpart of "Uncle" Tom. The resemblance is so perfect, that he might have been the original of Mrs. Stowe's christian hero. The thought of leaving these dear friends, greatly troubled me, for I was going without the hope of ever returning to Baltimore again; the feud between Master Hugh and his brother being bitter and irreconcilable, or, at least, supposed to be so.

In addition to thoughts of friends from whom I was parting, as I supposed, _forever_, I had the grief of neglected chances of escape to brood over. I had put off running away, until now I was to be placed where the opportunities for escaping were much fewer than in a large city like Baltimore.

On my way from Baltimore to St. Michael's, down the Chesapeake bay, our sloop—the "Amanda"—was passed by the steamers plying between that city and Philadelphia, and I watched the course of those steamers, and, while going to St. Michael's, I formed a plan to escape from slavery; of which plan, and matters connected therewith the kind reader shall learn more hereafter.

CHAPTER XIV. _Experience in St. Michael's_

THE VILLAGE—ITS INHABITANTS—THEIR OCCUPATION AND LOW PROPENSITIES CAPTAN(sic) THOMAS AULD—HIS CHARACTER—HIS SECOND WIFE, ROWENA—WELL MATCHED—SUFFERINGS FROM HUNGER—OBLIGED TO TAKE

FOOD—MODE OF ARGUMENT IN VINDICATION THEREOF—NO MORAL CODE OF FREE SOCIETY CAN APPLY TO SLAVE SOCIETY—SOUTHERN CAMP MEETING—WHAT MASTER THOMAS DID THERE—HOPES—SUSPICIONS ABOUT HIS CONVERSION—THE RESULT—FAITH AND WORKS ENTIRELY AT VARIANCE—HIS RISE AND PROGRESS IN THE CHURCH—POOR COUSIN “HENNY”—HIS TREATMENT OF HER—THE METHODIST PREACHERS—THEIR UTTER DISREGARD OF US—ONE EXCELLENT EXCEPTION—REV. GEORGE COOKMAN—SABBATH SCHOOL—HOW BROKEN UP AND BY WHOM—A FUNERAL PALL CAST OVER ALL MY PROSPECTS—COVEY THE NEGRO-BREAKER.

St. Michael’s, the village in which was now my new home, compared favorably with villages in slave states, generally. There were a few comfortable dwellings in it, but the place, as a whole, wore a dull, slovenly, enterprise-forsaken aspect. The mass of the buildings were wood; they had never enjoyed the artificial adornment of paint, and time and storms had worn off the bright color of the wood, leaving them almost as black as buildings charred by a conflagration.

St. Michael’s had, in former years, (previous to 1833, for that was the year I went to reside there,) enjoyed some reputation as a ship building community, but that business had almost entirely given place to oyster fishing, for the Baltimore and Philadelphia markets—a course of life highly unfavorable to morals, industry, and manners. Miles river was broad, and its oyster fishing grounds were extensive; and the fishermen were out, often, all day, and a part of the night, during autumn, winter and spring. This exposure was an excuse for carrying with them, in considerable quanties(sic), spirituous liquors, the then supposed best antidote for cold. Each canoe was supplied with its jug of rum; and tippling, among this class of the citizens of St. Michael’s, became general. This drinking habit, in an ignorant population, fostered coarseness, vulgarity and an indolent disregard for the social improvement of the place, so that it was admitted, by the few sober, thinking people who remained there, that St. Michael’s had become a very _unsaintly_, as well as unsightly place, before I went there to reside.

I left Baltimore for St. Michael’s in the month of March, 1833. I know the year, because it was the one succeeding the first cholera in Baltimore, and was the year, also, of that strange phenomenon, when the heavens seemed about to part with its starry train. I witnessed this gorgeous spectacle, and was awe-struck. The air seemed filled with bright, descending messengers from the sky. It was about daybreak when I saw this sublime scene. I was not without the suggestion, at the moment, that it might be the harbinger of the coming of the Son of Man; and, in my then state of mind, I was prepared to hail Him as my friend and deliverer. I had read, that the “stars shall fall from heaven”; and they were now falling. I was suffering much in my mind. It did seem that every time the young tendrils of my affection became attached, they were rudely broken by some unnatural outside power; and I was beginning to look away to heaven for the rest denied me on earth.

But, to my story. It was now more than seven years since I had lived with Master Thomas Auld, in the family of my old master, on Col. Lloyd’s plantation. We were almost entire strangers to each other; for, when I knew him at the house of my old master, it was not as a _master_, but simply as “Captain Auld,” who had married old master’s daughter. All my lessons concerning his temper and disposition, and the best methods of pleasing him, were yet to be learnt. Slaveholders, however, are not very ceremonious in approaching a slave; and my ignorance of the new material in shape of a master was but transient. Nor was my mistress long in making known her animus. She was not a “Miss Lucretia,” traces of whom I yet remembered, and the more especially, as I saw them shining in the face of little Amanda, her daughter, now living under a step-mother’s government. I had not forgotten the soft hand, guided by a tender heart, that bound up with healing balsam the gash made in my head by Ike, the son of Abel. Thomas and Rowena, I found to be a well-matched pair. _He_ was stingy, and _she_ was cruel; and—what was quite natural in such cases—she possessed the ability to make him as cruel as herself, while she could easily descend to the level of his meanness. In the house of Master Thomas, I was made—for the first time in seven years to feel the pinchings of hunger, and this was not very easy to bear.

For, in all the changes of Master Hugh’s family, there was no change in the bountifulness with which they supplied me with food. Not to give a slave enough to eat, is meanness intensified, and it is so recognized among slaveholders generally, in Maryland. The rule is, no matter how coarse the food, only let there be enough of it. This is the theory, and—in the part of Maryland I came from—the general practice accords with this theory. Lloyd’s plantation was an exception, as was, also, the house of Master Thomas Auld.

All know the lightness of Indian corn-meal, as an article of food, and can easily judge from the following facts whether the statements I have made of the stinginess of Master Thomas, are borne out. There were four slaves of us in the kitchen, and four whites in the great house Thomas Auld, Mrs. Auld, Hadaway Auld (brother of Thomas Auld) and little Amanda. The names of the slaves in the kitchen, were Eliza, my sister; Priscilla, my aunt; Henny, my cousin; and myself. There were eight persons in the

family. There was, each week, one half bushel of corn-meal brought from the mill; and in the kitchen, corn-meal was almost our exclusive food, for very little else was allowed us. Out of this bushel of corn-meal, the family in the great house had a small loaf every morning; thus leaving us, in the kitchen, with not quite a half a peck per week, apiece. This allowance was less than half the allowance of food on Lloyd's plantation. It was not enough to subsist upon; and we were, therefore, reduced to the wretched necessity of living at the expense of our neighbors. We were compelled either to beg, or to steal, and we did both. I frankly confess, that while I hated everything like stealing, _as such_, I nevertheless did not hesitate to take food, when I was hungry, wherever I could find it. Nor was this practice the mere result of an unreasoning instinct; it was, in my case, the result of a clear apprehension of the claims of morality. I weighed and considered the matter closely, before I ventured to satisfy my hunger by such means. Considering that my labor and person were the property of Master Thomas, and that I was by him deprived of the necessaries of life necessaries obtained by my own labor—it was easy to deduce the right to supply myself with what was my own. It was simply appropriating what was my own to the use of my master, since the health and strength derived from such food were exerted in _his_ service. To be sure, this was stealing, according to the law and gospel I heard from St. Michael's pulpit; but I had already begun to attach less importance to what dropped from that quarter, on that point, while, as yet, I retained my reverence for religion. It was not always convenient to steal from master, and the same reason why I might, innocently, steal from him, did not seem to justify me in stealing from others. In the case of my master, it was only a question of _removal_—the taking his meat out of one tub, and putting it into another; the ownership of the meat was not affected by the transaction. At first, he owned it in the _tub_, and last, he owned it in _me_. His meat house was not always open. There was a strict watch kept on that point, and the key was on a large bunch in Rowena's pocket. A great many times have we, poor creatures, been severely pinched with hunger, when meat and bread have been moulding under the lock, while the key was in the pocket of our mistress. This had been so when she _knew_ we were nearly half starved; and yet, that mistress, with saintly air, would kneel with her husband, and pray each morning that a merciful God would bless them in basket and in store, and save them, at last, in his kingdom. But I proceed with the argument.

It was necessary that right to steal from _others_ should be established; and this could only rest upon a wider range of generalization than that which supposed the right to steal from my master.

It was sometime before I arrived at this clear right. The reader will get some idea of my train of reasoning, by a brief statement of the case. "I am," thought I, "not only the slave of Thomas, but I am the slave of society at large. Society at large has bound itself, in form and in fact, to assist Master Thomas in robbing me of my rightful liberty, and of the just reward of my labor; therefore, whatever rights I have against Master Thomas, I have, equally, against those confederated with him in robbing me of liberty. As society has marked me out as privileged plunder, on the principle of self-preservation I am justified in plundering in turn. Since each slave belongs to all; all must, therefore, belong to each."

I shall here make a profession of faith which may shock some, offend others, and be dissented from by all. It is this: Within the bounds of his just earnings, I hold that the slave is fully justified in helping himself to the _gold and silver, and the best apparel of his master, or that of any other slaveholder; and that such taking is not stealing in any just sense of that word_.

The morality of _free_ society can have no application to _slave_ society. Slaveholders have made it almost impossible for the slave to commit any crime, known either to the laws of God or to the laws of man. If he steals, he takes his own; if he kills his master, he imitates only the heroes of the revolution. Slaveholders I hold to be individually and collectively responsible for all the evils which grow out of the horrid relation, and I believe they will be so held at the judgment, in the sight of a just God. Make a man a slave, and you rob him of moral responsibility. Freedom of choice is the essence of all accountability. But my kind readers are, probably, less concerned about my opinions, than about that which more nearly touches my personal experience; albeit, my opinions have, in some sort, been formed by that experience.

Bad as slaveholders are, I have seldom met with one so entirely destitute of every element of character capable of inspiring respect, as was my present master, Capt. Thomas Auld.

When I lived with him, I thought him incapable of a noble action. The leading trait in his character was intense selfishness. I think he was fully aware of this fact himself, and often tried to conceal it. Capt. Auld was not a _born_ slaveholder—not a birthright member of the slaveholding oligarchy. He was only a slaveholder by _marriage-right;_ and, of all slaveholders, these latter are, _by far_, the most exacting. There was in him all the love of domination, the pride of mastery, and the swagger of authority, but his rule lacked the vital element of consistency. He could be cruel; but his methods of showing it were cowardly, and evinced his meanness rather than his spirit. His commands were strong, his enforcement weak.

Slaves are not insensible to the whole-souled characteristics of a generous, dashing slaveholder, who is fearless of consequences; and they prefer a master of this bold and daring kind—even with the risk of being shot down for impudence to the fretful, little soul, who never uses the lash but at the suggestion of a love of gain.

Slaves, too, readily distinguish between the birthright bearing of the original slaveholder and the assumed attitudes of the accidental slaveholder; and while they cannot respect either, they certainly despise the latter more than the former.

The luxury of having slaves wait upon him was something new to Master Thomas; and for it he was wholly unprepared. He was a slaveholder, without the ability to hold or manage his slaves. We seldom called him "master," but generally addressed him by his "bay craft" title—"_Capt. Auld_." It is easy to see that such conduct might do much to make him appear awkward, and, consequently, fretful. His wife was especially solicitous to have us call her husband "master." Is your _master_ at the store?"—"Where is your _master_?"—"Go and tell your _master"_—"I will make your _master_ acquainted with your conduct"—she would say; but we were inapt scholars. Especially were I and my sister Eliza inapt in this particular. Aunt Priscilla was less stubborn and defiant in her spirit than Eliza and myself; and, I think, her road was less rough than ours.

In the month of August, 1833, when I had almost become desperate under the treatment of Master Thomas, and when I entertained more strongly than ever the oft-repeated determination to run away, a circumstance occurred which seemed to promise brighter and better days for us all. At a Methodist camp-meeting, held in the Bay Side (a famous place for campmeetings) about eight miles from St. Michael's, Master Thomas came out with a profession of religion. He had long been an object of interest to the church, and to the ministers, as I had seen by the repeated visits and lengthy exhortations of the latter. He was a fish quite worth catching, for he had money and standing. In the community of St. Michael's he was equal to the best citizen. He was strictly temperate; _perhaps_, from principle, but most likely, from interest. There was very little to do for him, to give him the appearance of piety, and to make him a pillar in the church. Well, the camp-meeting continued a week; people gathered from all parts of the county, and two steamboat loads came from Baltimore. The ground was happily chosen; seats were arranged; a stand erected; a rude altar fenced in, fronting the preachers' stand, with straw in it for the accommodation of mourners. This latter would hold at least one hundred persons. In front, and on the sides of the preachers' stand, and outside the long rows of seats, rose the first class of stately tents, each vieing with the other in strength, neatness, and capacity for accommodating its inmates. Behind this first circle of tents was another, less imposing, which reached round the camp-ground to the speakers' stand. Outside this second class of tents were covered wagons, ox carts, and vehicles of every shape and size. These served as tents to their owners. Outside of these, huge fires were burning, in all directions, where roasting, and boiling, and frying, were going on, for the benefit of those who were attending to their own spiritual welfare within the circle. _Behind_ the preachers' stand, a narrow space was marked out for the use of the colored people. There were no seats provided for this class of persons; the preachers addressed them, _"over the left,"_ if they addressed them at all. After the preaching was over, at every service, an invitation was given to mourners to come into the pen; and, in some cases, ministers went out to persuade men and women to come in. By one of these ministers, Master Thomas Auld was persuaded to go inside the pen. I was deeply interested in that matter, and followed; and, though colored people were not allowed either in the pen or in front of the preachers' stand, I ventured to take my stand at a sort of half-way place between the blacks and whites, where I could distinctly see the movements of mourners, and especially the progress of Master Thomas.

"If he has got religion," thought I, "he will emancipate his slaves; and if he should not do so much as this, he will, at any rate, behave toward us more kindly, and feed us more generously than he has heretofore done." Appealing to my own religious experience, and judging my master by what was true in my own case, I could not regard him as soundly converted, unless some such good results followed his profession of religion.

But in my expectations I was doubly disappointed; Master Thomas was _Master Thomas_ still. The fruits of his righteousness were to show themselves in no such way as I had anticipated. His conversion was not to change his relation toward men—at any rate not toward BLACK men—but toward God. My faith, I confess, was not great. There was something in his appearance that, in my mind, cast a doubt over his conversion. Standing where I did, I could see his every movement. I watched narrowly while he remained in the little pen; and although I saw that his face was extremely red, and his hair disheveled, and though I heard him groan, and saw a stray tear halting on his cheek, as if inquiring "which way shall I go?"—I could not wholly confide in the genuineness of his conversion. The hesitating behavior of that tear-drop and its loneliness, distressed me, and cast a doubt upon the whole transaction, of which it was a part. But people said, _"Capt. Auld had come through,"_ and it was for me to hope for the best. I was bound to do this, in charity, for I, too, was religious, and had been in the church full three years, although now I was not more than sixteen years old. Slaveholders may, sometimes, have confidence in the piety of some of their slaves; but the slaves seldom have confidence in the piety of their masters. _"He cant go to heaven with our blood in his skirts_," is a settled point in the creed of every

slave; rising superior to all teaching to the contrary, and standing forever as a fixed fact. The highest evidence the slaveholder can give the slave of his acceptance with God, is the emancipation of his slaves. This is proof that he is willing to give up all to God, and for the sake of God. Not to do this, was, in my estimation, and in the opinion of all the slaves, an evidence of half-heartedness, and wholly inconsistent with the idea of genuine conversion. I had read, also, somewhere in the Methodist Discipline, the following question and answer:

"_Question_. What shall be done for the extirpation of slavery?

"_Answer_. We declare that we are much as ever convinced of the great evil of slavery; therefore, no slaveholder shall be eligible to any official station in our church."

These words sounded in my ears for a long time, and encouraged me to hope. But, as I have before said, I was doomed to disappointment. Master Thomas seemed to be aware of my hopes and expectations concerning him. I have thought, before now, that he looked at me in answer to my glances, as much as to say, "I will teach you, young man, that, though I have parted with my sins, I have not parted with my sense. I shall hold my slaves, and go to heaven too."

Possibly, to convince us that we must not presume _too much_ upon his recent conversion, he became rather more rigid and stringent in his exactions. There always was a scarcity of good nature about the man; but now his whole countenance was _soured_ over with the seemings of piety. His religion, therefore, neither made him emancipate his slaves, nor caused him to treat them with greater humanity. If religion had any effect on his character at all, it made him more cruel and hateful in all his ways. The natural wickedness of his heart had not been removed, but only reinforced, by the profession of religion. Do I judge him harshly? God forbid. Facts _are_ facts. Capt. Auld made the greatest profession of piety. His house was, literally, a house of prayer. In the morning, and in the evening, loud prayers and hymns were heard there, in which both himself and his wife joined; yet, _no more meal_ was brought from the mill, _no more attention_ was paid to the moral welfare of the kitchen; and nothing was done to make us feel that the heart of Master Thomas was one whit better than it was before he went into the little pen, opposite to the preachers' stand, on the camp ground.

Our hopes (founded on the discipline) soon vanished; for the authorities let him into the church _at once_, and before he was out of his term of _probation_, I heard of his leading class! He distinguished himself greatly among the brethren, and was soon an exhorter. His progress was almost as rapid as the growth of the fabled vine of Jack's bean. No man was more active than he, in revivals. He would go many miles to assist in carrying them on, and in getting outsiders interested in religion. His house being one of the holiest, if not the happiest in St. Michael's, became the "preachers' home." These preachers evidently liked to share Master Thomas's hospitality; for while he _starved us_, he _stuffed_ them. Three or four of these ambassadors of the gospel—according to slavery—have been there at a time; all living on the fat of the land, while we, in the kitchen, were nearly starving. Not often did we get a smile of recognition from these holy men. They seemed almost as unconcerned about our getting to heaven, as they were about our getting out of slavery. To this general charge there was one exception—the Rev. GEORGE COOKMAN. Unlike Rev. Messrs. Storks, Ewry, Hickey, Humphrey and Cooper (all whom were on the St. Michael's circuit) he kindly took an interest in our temporal and spiritual welfare. Our souls and our bodies were all alike sacred in his sight; and he really had a good deal of genuine anti-slavery feeling mingled with his colonization ideas. There was not a slave in our neighborhood that did not love, and almost venerate, Mr. Cookman. It was pretty generally believed that he had been chiefly instrumental in bringing one of the largest slaveholders—Mr. Samuel Harrison—in that neighborhood, to emancipate all his slaves, and, indeed, the general impression was, that Mr. Cookman had labored faithfully with slaveholders, whenever he met them, to induce them to emancipate their bondmen, and that he did this as a religious duty. When this good man was at our house, we were all sure to be called in to prayers in the morning; and he was not slow in making inquiries as to the state of our minds, nor in giving us a word of exhortation and of encouragement. Great was the sorrow of all the slaves, when this faithful preacher of the gospel was removed from the Talbot county circuit. He was an eloquent preacher, and possessed what few ministers, south of Mason Dixon's line, possess, or _dare_ to show, viz: a warm and philanthropic heart. The Mr. Cookman, of whom I speak, was an Englishman by birth, and perished while on his way to England, on board the ill-fated "President". Could the thousands of slaves in Maryland know the fate of the good man, to whose words of comfort they were so largely indebted, they would thank me for dropping a tear on this page, in memory of their favorite preacher, friend and benefactor.

But, let me return to Master Thomas, and to my experience, after his conversion. In Baltimore, I could, occasionally, get into a Sabbath school, among the free children, and receive lessons, with the rest; but, having already learned both to read and to write, I was more of a teacher than a pupil, even there. When, however, I went back to the Eastern Shore, and was at the house of Master

Thomas, I was neither allowed to teach, nor to be taught. The whole community—with but a single exception, among the whites—frowned upon everything like imparting instruction either to slaves or to free colored persons. That single exception, a pious young man, named Wilson, asked me, one day, if I would like to assist him in teaching a little Sabbath school, at the house of a free colored man in St. Michael's, named James Mitchell. The idea was to me a delightful one, and I told him I would gladly devote as much of my Sabbath as I could command, to that most laudable work. Mr. Wilson soon mustered up a dozen old spelling books, and a few testaments; and we commenced operations, with some twenty scholars, in our Sunday school. Here, thought I, is something worth living for; here is an excellent chance for usefulness; and I shall soon have a company of young friends, lovers of knowledge, like some of my Baltimore friends, from whom I now felt parted forever.

Our first Sabbath passed delightfully, and I spent the week after very joyously. I could not go to Baltimore, but I could make a little Baltimore here. At our second meeting, I learned that there was some objection to the existence of the Sabbath school; and, sure enough, we had scarcely got at work—_good work_, simply teaching a few colored children how to read the gospel of the Son of God—when in rushed a mob, headed by Mr. Wright Fairbanks and Mr. Garrison West—two class-leaders—and Master Thomas; who, armed with sticks and other missiles, drove us off, and commanded us never to meet for such a purpose again. One of this pious crew told me, that as for my part, I wanted to be another Nat Turner; and if I did not look out, I should get as many balls into me, as Nat did into him. Thus ended the infant Sabbath school, in the town of St. Michael's. The reader will not be surprised when I say, that the breaking up of my Sabbath school, by these class-leaders, and professedly holy men, did not serve to strengthen my religious convictions. The cloud over my St. Michael's home grew heavier and blacker than ever.

It was not merely the agency of Master Thomas, in breaking up and destroying my Sabbath school, that shook my confidence in the power of southern religion to make men wiser or better; but I saw in him all the cruelty and meanness, _after_ his conversion, which he had exhibited before he made a profession of religion. His cruelty and meanness were especially displayed in his treatment of my unfortunate cousin, Henny, whose lameness made her a burden to him. I have no extraordinary personal hard usage toward myself to complain of, against him, but I have seen him tie up the lame and maimed woman, and whip her in a manner most brutal, and shocking; and then, with blood-chilling blasphemy, he would quote the passage of scripture, "That servant which knew his lord's will, and prepared not himself, neither did according to his will, shall be beaten with many stripes." Master would keep this lacerated woman tied up by her wrists, to a bolt in the joist, three, four and five hours at a time. He would tie her up early in the morning, whip her with a cowskin before breakfast; leave her tied up; go to his store, and, returning to his dinner, repeat the castigation; laying on the rugged lash, on flesh already made raw by repeated blows. He seemed desirous to get the poor girl out of existence, or, at any rate, off his hands. In proof of this, he afterwards gave her away to his sister Sarah (Mrs. Cline) but, as in the case of Master Hugh, Henny was soon returned on his hands. Finally, upon a pretense that he could do nothing with her (I use his own words) he "set her adrift, to take care of herself." Here was a recently converted man, holding, with tight grasp, the well-framed, and able bodied slaves left him by old master—the persons, who, in freedom, could have taken care of themselves; yet, turning loose the only cripple among them, virtually to starve and die.

No doubt, had Master Thomas been asked, by some pious northern brother, _why_ he continued to sustain the relation of a slaveholder, to those whom he retained, his answer would have been precisely the same as many other religious slaveholders have returned to that inquiry, viz: "I hold my slaves for their own good."

Bad as my condition was when I lived with Master Thomas, I was soon to experience a life far more goading and bitter. The many differences springing up between myself and Master Thomas, owing to the clear perception I had of his character, and the boldness with which I defended myself against his capricious complaints, led him to declare that I was unsuited to his wants; that my city life had affected me perniciously; that, in fact, it had almost ruined me for every good purpose, and had fitted me for everything that was bad. One of my greatest faults, or offenses, was that of letting his horse get away, and go down to the farm belonging to his father-in-law. The animal had a liking for that farm, with which I fully sympathized. Whenever I let it out, it would go dashing down the road to Mr. Hamilton's, as if going on a grand frolic. My horse gone, of course I must go after it. The explanation of our mutual attachment to the place is the same; the horse found there good pasturage, and I found there plenty of bread. Mr. Hamilton had his faults, but starving his slaves was not among them. He gave food, in abundance, and that, too, of an excellent quality. In Mr. Hamilton's cook—Aunt Mary—I found a most generous and considerate friend. She never allowed me to go there without giving me bread enough to make good the deficiencies of a day or two. Master Thomas at last resolved to endure my behavior no longer; he could neither keep me, nor his horse, we liked so well to be at his father-in-law's farm. I had now lived with him nearly nine months, and he had given me a number of severe whippings, without any visible improvement in my character, or my conduct; and now he was resolved to put me out—as he said—"_to be broken._"

There was, in the Bay Side, very near the camp ground, where my master got his religious impressions, a man named Edward Covey, who enjoyed the execrated reputation, of being a first rate hand at breaking young Negroes. This Covey was a poor man, a farm renter; and this reputation (hateful as it was to the slaves and to all good men) was, at the same time, of immense advantage to him. It enabled him to get his farm tilled with very little expense, compared with what it would have cost him without this most extraordinary reputation. Some slaveholders thought it an advantage to let Mr. Covey have the government of their slaves a year or two, almost free of charge, for the sake of the excellent training such slaves got under his happy management! Like some horse breakers, noted for their skill, who ride the best horses in the country without expense, Mr. Covey could have under him, the most fiery bloods of the neighborhood, for the simple reward of returning them to their owners, _well broken_. Added to the natural fitness of Mr. Covey for the duties of his profession, he was said to “enjoy religion,” and was as strict in the cultivation of piety, as he was in the cultivation of his farm. I was made aware of his character by some who had been under his hand; and while I could not look forward to going to him with any pleasure, I was glad to get away from St. Michael’s. I was sure of getting enough to eat at Covey’s, even if I suffered in other respects. _This_, to a hungry man, is not a prospect to be regarded with indifference.

CHAPTER XV. _Covey, the Negro Breaker_

JOURNEY TO MY NEW MASTER’S—MEDITATIONS BY THE WAY—VIEW OF COVEY’S RESIDENCE—THE FAMILY—MY AWKWARDNESS AS A FIELD HAND—A CRUEL BEATING—WHY IT WAS GIVEN—DESCRIPTION OF COVEY—FIRST ADVENTURE AT OX DRIVING—HAIR BREADTH ESCAPES—OX AND MAN ALIKE PROPERTY—COVEY’S MANNER OF PROCEEDING TO WHIP—HARD LABOR BETTER THAN THE WHIP FOR BREAKING DOWN THE SPIRIT—CUNNING AND TRICKERY OF COVEY—FAMILY WORSHIP—SHOCKING CONTEMPT FOR CHASTITY—I AM BROKEN DOWN—GREAT MENTAL AGITATION IN CONTRASTING THE FREEDOM OF THE SHIPS WITH HIS OWN SLAVERY—ANGUISH BEYOND DESCRIPTION.

The morning of the first of January, 1834, with its chilling wind and pinching frost, quite in harmony with the winter in my own mind, found me, with my little bundle of clothing on the end of a stick, swung across my shoulder, on the main road, bending my way toward Covey’s, whither I had been imperiously ordered by Master Thomas. The latter had been as good as his word, and had committed me, without reserve, to the mastery of Mr. Edward Covey. Eight or ten years had now passed since I had been taken from my grandmother’s cabin, in Tuckahoe; and these years, for the most part, I had spent in Baltimore, where—as the reader has already seen—I was treated with comparative tenderness. I was now about to sound profounder depths in slave life. The rigors of a field, less tolerable than the field of battle, awaited me. My new master was notorious for his fierce and savage disposition, and my only consolation in going to live with him was, the certainty of finding him precisely as represented by common fame. There was neither joy in my heart, nor elasticity in my step, as I started in search of the tyrant’s home. Starvation made me glad to leave Thomas Auld’s, and the cruel lash made me dread to go to Covey’s. Escape was impossible; so, heavy and sad, I paced the seven miles, which separated Covey’s house from St. Michael’s—thinking much by the solitary way—averse to my condition; but _thinking_ was all I could do. Like a fish in a net, allowed to play for a time, I was now drawn rapidly to the shore, secured at all points. “I am,” thought I, “but the sport of a power which makes no account, either of my welfare or of my happiness. By a law which I can clearly comprehend, but cannot evade nor resist, I am ruthlessly snatched from the hearth of a fond grandmother, and hurried away to the home of a mysterious ‘old master;’ again I am removed from there, to a master in Baltimore; thence am I snatched away to the Eastern Shore, to be valued with the beasts of the field, and, with them, divided and set apart for a possessor; then I am sent back to Baltimore; and by the time I have formed new attachments, and have begun to hope that no more rude shocks shall touch me, a difference arises between brothers, and I am again broken up, and sent to St. Michael’s; and now, from the latter place, I am footing my way to the home of a new master, where, I am given to understand, that, like a wild young working animal, I am to be broken to the yoke of a bitter and life-long bondage.”

With thoughts and reflections like these, I came in sight of a small wood-colored building, about a mile from the main road, which, from the description I had received, at starting, I easily recognized as my new home. The Chesapeake bay—upon the jutting banks of which the little wood-colored house was standing—white with foam, raised by the heavy north-west wind; Poplar Island, covered with a thick, black pine forest, standing out amid this half ocean; and Kent Point, stretching its sandy, desert-like shores out into the foam-cested bay—were all in sight, and deepened the wild and desolate aspect of my new home.

The good clothes I had brought with me from Baltimore were now worn thin, and had not been replaced; for Master Thomas was as little careful to provide us against cold, as against hunger. Met here by a north wind, sweeping through an open space of forty miles, I was glad to make any port; and, therefore, I speedily pressed on to the little wood-colored house. The family consisted of

Mr. and Mrs. Covey; Miss Kemp (a broken-backed woman) a sister of Mrs. Covey; William Hughes, cousin to Edward Covey; Caroline, the cook; Bill Smith, a hired man; and myself. Bill Smith, Bill Hughes, and myself, were the working force of the farm, which consisted of three or four hundred acres. I was now, for the first time in my life, to be a field hand; and in my new employment I found myself even more awkward than a green country boy may be supposed to be, upon his first entrance into the bewildering scenes of city life; and my awkwardness gave me much trouble. Strange and unnatural as it may seem, I had been at my new home but three days, before Mr. Covey (my brother in the Methodist church) gave me a bitter foretaste of what was in reserve for me. I presume he thought, that since he had but a single year in which to complete his work, the sooner he began, the better. Perhaps he thought that by coming to blows at once, we should mutually better understand our relations. But to whatever motive, direct or indirect, the cause may be referred, I had not been in his possession three whole days, before he subjected me to a most brutal chastisement. Under his heavy blows, blood flowed freely, and wales were left on my back as large as my little finger. The sores on my back, from this flogging, continued for weeks, for they were kept open by the rough and coarse cloth which I wore for shirting. The occasion and details of this first chapter of my experience as a field hand, must be told, that the reader may see how unreasonable, as well as how cruel, my new master, Covey, was. The whole thing I found to be characteristic of the man; and I was probably treated no worse by him than scores of lads who had previously been committed to him, for reasons similar to those which induced my master to place me with him. But, here are the facts connected with the affair, precisely as they occurred.

On one of the coldest days of the whole month of January, 1834, I was ordered, at day break, to get a load of wood, from a forest about two miles from the house. In order to perform this work, Mr. Covey gave me a pair of unbroken oxen, for, it seems, his breaking abilities had not been turned in this direction; and I may remark, in passing, that working animals in the south, are seldom so well trained as in the north. In due form, and with all proper ceremony, I was introduced to this huge yoke of unbroken oxen, and was carefully told which was “Buck,” and which was “Darby”—which was the “in hand,” and which was the “off hand” ox. The master of this important ceremony was no less a person than Mr. Covey, himself; and the introduction was the first of the kind I had ever had. My life, hitherto, had led me away from horned cattle, and I had no knowledge of the art of managing them. What was meant by the “in ox,” as against the “off ox,” when both were equally fastened to one cart, and under one yoke, I could not very easily divine; and the difference, implied by the names, and the peculiar duties of each, were alike _Greek_ to me. Why was not the “off ox” called the “in ox?” Where and what is the reason for this distinction in names, when there is none in the things themselves? After initiating me into the _“woa,” “back” “gee,” “hither”_—the entire spoken language between oxen and driver—Mr. Covey took a rope, about ten feet long and one inch thick, and placed one end of it around the horns of the “in hand ox,” and gave the other end to me, telling me that if the oxen started to run away, as the scamp knew they would, I must hold on to the rope and stop them. I need not tell any one who is acquainted with either the strength of the disposition of an untamed ox, that this order was about as unreasonable as a command to shoulder a mad bull! I had never driven oxen before, and I was as awkward, as a driver, as it is possible to conceive. It did not answer for me to plead ignorance, to Mr. Covey; there was something in his manner that quite forbade that. He was a man to whom a slave seldom felt any disposition to speak. Cold, distant, morose, with a face wearing all the marks of captious pride and malicious sternness, he repelled all advances. Covey was not a large man; he was only about five feet ten inches in height, I should think; short necked, round shoulders; of quick and wiry motion, of thin and wolfish visage; with a pair of small, greenish-gray eyes, set well back under a forehead without dignity, and constantly in motion, and floating his passions, rather than his thoughts, in sight, but denying them utterance in words. The creature presented an appearance altogether ferocious and sinister, disagreeable and forbidding, in the extreme. When he spoke, it was from the corner of his mouth, and in a sort of light growl, like a dog, when an attempt is made to take a bone from him. The fellow had already made me believe him even _worse_ than he had been presented. With his directions, and without stopping to question, I started for the woods, quite anxious to perform my first exploit in driving, in a creditable manner. The distance from the house to the woods gate a full mile, I should think—was passed over with very little difficulty; for although the animals ran, I was fleet enough, in the open field, to keep pace with them; especially as they pulled me along at the end of the rope; but, on reaching the woods, I was speedily thrown into a distressing plight. The animals took fright, and started off ferociously into the woods, carrying the cart, full tilt, against trees, over stumps, and dashing from side to side, in a manner altogether frightful. As I held the rope, I expected every moment to be crushed between the cart and the huge trees, among which they were so furiously dashing. After running thus for several minutes, my oxen were, finally, brought to a stand, by a tree, against which they dashed themselves with great violence, upsetting the cart, and entangling themselves among sundry young saplings. By the shock, the body of the cart was flung in one direction, and the wheels and tongue in another, and all in the greatest confusion. There I was, all alone, in a thick wood, to which I was a stranger; my cart upset and shattered; my oxen entangled, wild, and enraged; and I, poor soul! but a green hand, to set all this disorder right. I knew no more of oxen than the ox driver is supposed to know of wisdom. After standing a few moments surveying the damage and disorder, and not without a presentiment that this trouble would draw after it others, even more distressing, I took one end of the cart body, and, by

an extra outlay of strength, I lifted it toward the axle-tree, from which it had been violently flung; and after much pulling and straining, I succeeded in getting the body of the cart in its place. This was an important step out of the difficulty, and its performance increased my courage for the work which remained to be done. The cart was provided with an ax, a tool with which I had become pretty well acquainted in the ship yard at Baltimore. With this, I cut down the saplings by which my oxen were entangled, and again pursued my journey, with my heart in my mouth, lest the oxen should again take it into their senseless heads to cut up a caper. My fears were groundless. Their spree was over for the present, and the rascals now moved off as soberly as though their behavior had been natural and exemplary. On reaching the part of the forest where I had been, the day before, chopping wood, I filled the cart with a heavy load, as a security against another running away. But, the neck of an ox is equal in strength to iron. It defies all ordinary burdens, when excited. Tame and docile to a proverb, when _well_ trained, the ox is the most sullen and intractable of animals when but half broken to the yoke.

I now saw, in my situation, several points of similarity with that of the oxen. They were property, so was I; they were to be broken, so was I. Covey was to break me, I was to break them; break and be broken—such is life.

Half the day already gone, and my face not yet homeward! It required only two day's experience and observation to teach me, that such apparent waste of time would not be lightly overlooked by Covey. I therefore hurried toward home; but, on reaching the lane gate, I met with the crowning disaster for the day. This gate was a fair specimen of southern handicraft. There were two huge posts, eighteen inches in diameter, rough hewed and square, and the heavy gate was so hung on one of these, that it opened only about half the proper distance. On arriving here, it was necessary for me to let go the end of the rope on the horns of the "in hand ox;" and now as soon as the gate was open, and I let go of it to get the rope, again, off went my oxen—making nothing of their load—full tilt; and in doing so they caught the huge gate between the wheel and the cart body, literally crushing it to splinters, and coming only within a few inches of subjecting me to a similar crushing, for I was just in advance of the wheel when it struck the left gate post. With these two hair-breadth escape, I thought I could sucessfully(sic) explain to Mr. Covey the delay, and avert apprehended punishment. I was not without a faint hope of being commended for the stern resolution which I had displayed in accomplishing the difficult task—a task which, I afterwards learned, even Covey himself would not have undertaken, without first driving the oxen for some time in the open field, preparatory to their going into the woods. But, in this I was disappointed. On coming to him, his countenance assumed an aspect of rigid displeasure, and, as I gave him a history of the casualties of my trip, his wolfish face, with his greenish eyes, became intensely ferocious. "Go back to the woods again," he said, muttering something else about wasting time. I hastily obeyed; but I had not gone far on my way, when I saw him coming after me. My oxen now behaved themselves with singular propriety, opposing their present conduct to my representation of their former antics. I almost wished, now that Covey was coming, they would do something in keeping with the character I had given them; but no, they had already had their spree, and they could afford now to be extra good, readily obeying my orders, and seeming to understand them quite as well as I did myself. On reaching the woods, my tormentor—who seemed all the way to be remarking upon the good behavior of his oxen—came up to me, and ordered me to stop the cart, accompanying the same with the threat that he would now teach me how to break gates, and idle away my time, when he sent me to the woods. Suiting the action to the word, Covey paced off, in his own wiry fashion, to a large, black gum tree, the young shoots of which are generally used for ox _goads_, they being exceedingly tough. Three of these _goads_, from four to six feet long, he cut off, and trimmed up, with his large jack-knife. This done, he ordered me to take off my clothes. To this unreasonable order I made no reply, but sternly refused to take off my clothing. "If you will beat me," thought I, "you shall do so over my clothes." After many threats, which made no impression on me, he rushed at me with something of the savage fierceness of a wolf, tore off the few and thinly worn clothes I had on, and proceeded to wear out, on my back, the heavy goads which he had cut from the gum tree. This flogging was the first of a series of floggings; and though very severe, it was less so than many which came after it, and these, for offenses far lighter than the gate breaking.

I remained with Mr. Covey one year (I cannot say I _lived_ with him) and during the first six months that I was there, I was whipped, either with sticks or cowskins, every week. Aching bones and a sore back were my constant companions. Frequent as the lash was used, Mr. Covey thought less of it, as a means of breaking down my spirit, than that of hard and long continued labor. He worked me steadily, up to the point of my powers of endurance. From the dawn of day in the morning, till the darkness was complete in the evening, I was kept at hard work, in the field or the woods. At certain seasons of the year, we were all kept in the field till eleven and twelve o'clock at night. At these times, Covey would attend us in the field, and urge us on with words or blows, as it seemed best to him. He had, in his life, been an overseer, and he well understood the business of slave driving. There was no deceiving him. He knew just what a man or boy could do, and he held both to strict account. When he pleased, he would work himself, like a very Turk, making everything fly before him. It was, however, scarcely necessary for Mr. Covey to be really present in the field, to have his work go on industriously. He had the faculty of making us feel that he was always present. By a series of adroitly managed

surprises, which he practiced, I was prepared to expect him at any moment. His plan was, never to approach the spot where his hands were at work, in an open, manly and direct manner. No thief was ever more artful in his devices than this man Covey. He would creep and crawl, in ditches and gullies; hide behind stumps and bushes, and practice so much of the cunning of the serpent, that Bill Smith and I—between ourselves—never called him by any other name than _"the snake."_ We fancied that in his eyes and his gait we could see a snakish resemblance. One half of his proficiency in the art of Negro breaking, consisted, I should think, in this species of cunning. We were never secure. He could see or hear us nearly all the time. He was, to us, behind every stump, tree, bush and fence on the plantation. He carried this kind of trickery so far, that he would sometimes mount his horse, and make believe he was going to St. Michael's; and, in thirty minutes afterward, you might find his horse tied in the woods, and the snake-like Covey lying flat in the ditch, with his head lifted above its edge, or in a fence corner, watching every movement of the slaves! I have known him walk up to us and give us special orders, as to our work, in advance, as if he were leaving home with a view to being absent several days; and before he got half way to the house, he would avail himself of our inattention to his movements, to turn short on his heels, conceal himself behind a fence corner or a tree, and watch us until the going down of the sun. Mean and contemptible as is all this, it is in keeping with the character which the life of a slaveholder is calculated to produce. There is no earthly inducement, in the slave's condition, to incite him to labor faithfully. The fear of punishment is the sole motive for any sort of industry, with him. Knowing this fact, as the slaveholder does, and judging the slave by himself, he naturally concludes the slave will be idle whenever the cause for this fear is absent. Hence, all sorts of petty deceptions are practiced, to inspire this fear.

But, with Mr. Covey, trickery was natural. Everything in the shape of learning or religion, which he possessed, was made to conform to this semi-lying propensity. He did not seem conscious that the practice had anything unmanly, base or contemptible about it. It was a part of an important system, with him, essential to the relation of master and slave. I thought I saw, in his very religious devotions, this controlling element of his character. A long prayer at night made up for the short prayer in the morning; and few men could seem more devotional than he, when he had nothing else to do.

Mr. Covey was not content with the cold style of family worship, adopted in these cold latitudes, which begin and end with a simple prayer. No! the voice of praise, as well as of prayer, must be heard in his house, night and morning. At first, I was called upon to bear some part in these exercises; but the repeated flogging given me by Covey, turned the whole thing into mockery. He was a poor singer, and mainly relied on me for raising the hymn for the family, and when I failed to do so, he was thrown into much confusion. I do not think that he ever abused me on account of these vexations. His religion was a thing altogether apart from his worldly concerns. He knew nothing of it as a holy principle, directing and controlling his daily life, making the latter conform to the requirements of the gospel. One or two facts will illustrate his character better than a volume of generalties(sic).

I have already said, or implied, that Mr. Edward Covey was a poor man. He was, in fact, just commencing to lay the foundation of his fortune, as fortune is regarded in a slave state. The first condition of wealth and respectability there, being the ownership of human property, every nerve is strained, by the poor man, to obtain it, and very little regard is had to the manner of obtaining it. In pursuit of this object, pious as Mr. Covey was, he proved himself to be as unscrupulous and base as the worst of his neighbors. In the beginning, he was only able—as he said—"to buy one slave;" and, scandalous and shocking as is the fact, he boasted that he bought her simply "_as a breeder_." But the worst is not told in this naked statement. This young woman (Caroline was her name) was virtually compelled by Mr. Covey to abandon herself to the object for which he had purchased her; and the result was, the birth of twins at the end of the year. At this addition to his human stock, both Edward Covey and his wife, Susan, were ecstatic with joy. No one dreamed of reproaching the woman, or of finding fault with the hired man—Bill Smith—the father of the children, for Mr. Covey himself had locked the two up together every night, thus inviting the result.

But I will pursue this revolting subject no further. No better illustration of the unchaste and demoralizing character of slavery can be found, than is furnished in the fact that this professedly Christian slaveholder, amidst all his prayers and hymns, was shamelessly and boastfully encouraging, and actually compelling, in his own house, undisguised and unmitigated fornication, as a means of increasing his human stock. I may remark here, that, while this fact will be read with disgust and shame at the north, it will be _laughed at_, as smart and praiseworthy in Mr. Covey, at the south; for a man is no more condemned there for buying a woman and devoting her to this life of dishonor, than for buying a cow, and raising stock from her. The same rules are observed, with a view to increasing the number and quality of the former, as of the latter.

I will here reproduce what I said of my own experience in this wretched place, more than ten years ago:

If at any one time of my life, more than another, I was made to drink the bitterest dregs of slavery, that time was during the first six months of my stay with Mr. Covey. We were worked all weathers. It was never too hot or too cold; it could never rain, blow, snow,

or hail too hard for us to work in the field. Work, work, work, was scarcely more the order of the day than the night. The longest days were too short for him, and the shortest nights were too long for him. I was somewhat unmanageable when I first went there; but a few months of his discipline tamed me. Mr. Covey succeeded in breaking me. I was broken in body, soul and spirit. My natural elasticity was crushed; my intellect languished; the disposition to read departed; the cheerful spark that lingered about my eye died; the dark night of slavery closed in upon me; and behold a man transformed into a brute!

Sunday was my only leisure time. I spent this in a sort of beast-like stupor, between sleep and wake, under some large tree. At times, I would rise up, a flash of energetic freedom would dart through my soul, accompanied with a faint beam of hope, flickered for a moment, and then vanished. I sank down again, mourning over my wretched condition. I was sometimes prompted to take my life, and that of Covey, but was prevented by a combination of hope and fear. My sufferings on this plantation seem now like a dream rather than a stern reality.

Our house stood within a few rods of the Chesapeake bay, whose broad bosom was ever white with sails from every quarter of the habitable globe. Those beautiful vessels, robed in purest white, so delightful to the eye of freemen, were to me so many shrouded ghosts, to terrify and torment me with thoughts of my wretched condition. I have often, in the deep stillness of a summer's Sabbath, stood all alone upon the banks of that noble bay, and traced, with saddened heart and tearful eye, the countless number of sails moving off to the mighty ocean. The sight of these always affected me powerfully. My thoughts would compel utterance; and there, with no audience but the Almighty, I would pour out my soul's complaint in my rude way, with an apostrophe to the moving multitude of ships:

"You are loosed from your moorings, and free; I am fast in my chains, and am a slave! You move merrily before the gentle gale, and I sadly before the bloody whip! You are freedom's swift-winged angels, that fly around the world; I am confined in bands of iron! O, that I were free! O, that I were on one of your gallant decks, and under your protecting wing! Alas! betwixt me and you the turbid waters roll. Go on, go on. O that I could also go! Could I but swim! If I could fly! O, why was I born a man, of whom to make a brute! The glad ship is gone; she hides in the dim distance. I am left in the hottest hell of unending slavery. O God, save me! God, deliver me! Let me be free! Is there any God? Why am I a slave? I will run away. I will not stand it. Get caught, or get clear, I'll try it. I had as well die with ague as with fever. I have only one life to lose. I had as well be killed running as die standing. Only think of it; one hundred miles straight north, and I am free! Try it? Yes! God helping me, I will. It cannot be that I shall live and die a slave. I will take to the water. This very bay shall yet bear me into freedom. The steamboats steered in a north-east coast from North Point. I will do the same; and when I get to the head of the bay, I will turn my canoe adrift, and walk straight through Delaware into Pennsylvania. When I get there, I shall not be required to have a pass; I will travel without being disturbed. Let but the first opportunity offer, and come what will, I am off. Meanwhile, I will try to bear up under the yoke. I am not the only slave in the world. Why should I fret? I can bear as much as any of them. Besides, I am but a boy, and all boys are bound to some one. It may be that my misery in slavery will only increase my happiness when I get free. There is a better day coming."

I shall never be able to narrate the mental experience through which it was my lot to pass during my stay at Covey's. I was completely wrecked, changed and bewildered; goaded almost to madness at one time, and at another reconciling myself to my wretched condition. Everything in the way of kindness, which I had experienced at Baltimore; all my former hopes and aspirations for usefulness in the world, and the happy moments spent in the exercises of religion, contrasted with my then present lot, but increased my anguish.

I suffered bodily as well as mentally. I had neither sufficient time in which to eat or to sleep, except on Sundays. The overwork, and the brutal chastisements of which I was the victim, combined with that ever-gnawing and soul-devouring thought—"_I am a slave—a slave for life—a slave with no rational ground to hope for freedom_"—rendered me a living embodiment of mental and physical wretchedness.

CHAPTER XVI. _Another Pressure of the Tyrant's Vice_

EXPERIENCE AT COVEY'S SUMMED UP—FIRST SIX MONTHS SEVERER THAN THE SECOND—PRELIMINARIES TO THE CHANCE—REASONS FOR NARRATING THE CIRCUMSTANCES—SCENE IN TREADING YARD—TAKEN ILL—UNUSUAL BRUTALITY OF COVEY—ESCAPE TO ST. MICHAEL'S—THE PURSUIT—SUFFERING IN THE WOODS—DRIVEN BACK AGAIN TO COVEY'S—BEARING OF MASTER THOMAS—THE SLAVE IS NEVER SICK—NATURAL TO EXPECT SLAVES TO FEIGN SICKNESS—LAZINESS OF SLAVEHOLDERS.

The foregoing chapter, with all its horrid incidents and shocking features, may be taken as a fair representation of the first six months of my life at Covey's. The reader has but to repeat, in his own mind, once a week, the scene in the woods, where Covey subjected me to his merciless lash, to have a true idea of my bitter experience there, during the first period of the breaking process through which Mr. Covey carried me. I have no heart to repeat each separate transaction, in which I was victim of his violence and brutality. Such a narration would fill a volume much larger than the present one. I aim only to give the reader a truthful impression of my slave life, without unnecessarily affecting him with harrowing details.

As I have elsewhere intimated that my hardships were much greater during the first six months of my stay at Covey's, than during the remainder of the year, and as the change in my condition was owing to causes which may help the reader to a better understanding of human nature, when subjected to the terrible extremities of slavery, I will narrate the circumstances of this change, although I may seem thereby to applaud my own courage. You have, dear reader, seen me humbled, degraded, broken down, enslaved, and brutalized, and you understand how it was done; now let us see the converse of all this, and how it was brought about; and this will take us through the year 1834.

On one of the hottest days of the month of August, of the year just mentioned, had the reader been passing through Covey's farm, he might have seen me at work, in what is there called the "treading yard"—a yard upon which wheat is trodden out from the straw, by the horses' feet. I was there, at work, feeding the "fan," or rather bringing wheat to the fan, while Bill Smith was feeding. Our force consisted of Bill Hughes, Bill Smith, and a slave by the name of Eli; the latter having been hired for this occasion. The work was simple, and required strength and activity, rather than any skill or intelligence, and yet, to one entirely unused to such work, it came very hard. The heat was intense and overpowering, and there was much hurry to get the wheat, trodden out that day, through the fan; since, if that work was done an hour before sundown, the hands would have, according to a promise of Covey, that hour added to their night's rest. I was not behind any of them in the wish to complete the day's work before sundown, and, hence, I struggled with all my might to get the work forward. The promise of one hour's repose on a week day, was sufficient to quicken my pace, and to spur me on to extra endeavor. Besides, we had all planned to go fishing, and I certainly wished to have a hand in that. But I was disappointed, and the day turned out to be one of the bitterest I ever experienced. About three o'clock, while the sun was pouring down his burning rays, and not a breeze was stirring, I broke down; my strength failed me; I was seized with a violent aching of the head, attended with extreme dizziness, and trembling in every limb. Finding what was coming, and feeling it would never do to stop work, I nerved myself up, and staggered on until I fell by the side of the wheat fan, feeling that the earth had fallen upon me. This brought the entire work to a dead stand. There was work for four; each one had his part to perform, and each part depended on the other, so that when one stopped, all were compelled to stop. Covey, who had now become my dread, as well as my tormentor, was at the house, about a hundred yards from where I was fanning, and instantly, upon hearing the fan stop, he came down to the treading yard, to inquire into the cause of our stopping. Bill Smith told him I was sick, and that I was unable longer to bring wheat to the fan.

I had, by this time, crawled away, under the side of a post-and-rail fence, in the shade, and was exceeding ill. The intense heat of the sun, the heavy dust rising from the fan, the stooping, to take up the wheat from the yard, together with the hurrying, to get through, had caused a rush of blood to my head. In this condition, Covey finding out where I was, came to me; and, after standing over me a while, he asked me what the matter was. I told him as well as I could, for it was with difficulty that I could speak. He then gave me a savage kick in the side, which jarred my whole frame, and commanded me to get up. The man had obtained complete control over me; and if he had commanded me to do any possible thing, I should, in my then state of mind, have endeavored to comply. I made an effort to rise, but fell back in the attempt, before gaining my feet. The brute now gave me another heavy kick, and again told me to rise. I again tried to rise, and succeeded in gaining my feet; but upon stooping to get the tub with which I was feeding the fan, I again staggered and fell to the ground; and I must have so fallen, had I been sure that a hundred bullets would have pierced me, as the consequence. While down, in this sad condition, and perfectly helpless, the merciless Negro breaker took up the hickory slab, with which Hughes had been striking off the wheat to a level with the sides of the half bushel measure (a very hard weapon) and with the sharp edge of it, he dealt me a heavy blow on my head which made a large gash, and caused the blood to run freely, saying, at the same time, "If _you have got the headache, I'll cure you_." This done, he ordered me again to rise, but I made no effort to do so; for I had made up my mind that it was useless, and that the heartless monster might now do his worst; he could but kill me, and that might put me out of my misery. Finding me unable to rise, or rather despairing of my doing so, Covey left me, with a view to getting on with the work without me. I was bleeding very freely, and my face was soon covered with my warm blood. Cruel and merciless as was the motive that dealt that blow, dear reader, the wound was fortunate for me. Bleeding was never more efficacious. The pain in my head speedily abated, and I was soon able to rise. Covey had, as I have said, now left me to my fate; and the question was, shall I return to my work, or shall I find my way to St. Michael's, and make Capt. Auld acquainted

with the atrocious cruelty of his brother Covey, and beseech him to get me another master? Remembering the object he had in view, in placing me under the management of Covey, and further, his cruel treatment of my poor crippled cousin, Henny, and his meanness in the matter of feeding and clothing his slaves, there was little ground to hope for a favorable reception at the hands of Capt. Thomas Auld. Nevertheless, I resolved to go straight to Capt. Auld, thinking that, if not animated by motives of humanity, he might be induced to interfere on my behalf from selfish considerations. “He cannot,” thought I, “allow his property to be thus bruised and battered, marred and defaced; and I will go to him, and tell him the simple truth about the matter.” In order to get to St. Michael’s, by the most favorable and direct road, I must walk seven miles; and this, in my sad condition, was no easy performance. I had already lost much blood; I was exhausted by over exertion; my sides were sore from the heavy blows planted there by the stout boots of Mr. Covey; and I was, in every way, in an unfavorable plight for the journey. I however watched my chance, while the cruel and cunning Covey was looking in an opposite direction, and started off, across the field, for St. Michael’s. This was a daring step; if it failed, it would only exasperate Covey, and increase the rigors of my bondage, during the remainder of my term of service under him; but the step was taken, and I must go forward. I succeeded in getting nearly half way across the broad field, toward the woods, before Mr. Covey observed me. I was still bleeding, and the exertion of running had started the blood afresh. _“Come back! Come back!”_ vociferated Covey, with threats of what he would do if I did not return instantly. But, disregarding his calls and his threats, I pressed on toward the woods as fast as my feeble state would allow. Seeing no signs of my stopping, Covey caused his horse to be brought out and saddled, as if he intended to pursue me. The race was now to be an unequal one; and, thinking I might be overhauled by him, if I kept the main road, I walked nearly the whole distance in the woods, keeping far enough from the road to avoid detection and pursuit. But, I had not gone far, before my little strength again failed me, and I laid down. The blood was still oozing from the wound in my head; and, for a time, I suffered more than I can describe. There I was, in the deep woods, sick and emaciated, pursued by a wretch whose character for revolting cruelty beggars all opprobrious speech—bleeding, and almost bloodless. I was not without the fear of bleeding to death. The thought of dying in the woods, all alone, and of being torn to pieces by the buzzards, had not yet been rendered tolerable by my many troubles and hardships, and I was glad when the shade of the trees, and the cool evening breeze, combined with my matted hair to stop the flow of blood. After lying there about three quarters of an hour, brooding over the singular and mournful lot to which I was doomed, my mind passing over the whole scale or circle of belief and unbelief, from faith in the overruling providence of God, to the blackest atheism, I again took up my journey toward St. Michael’s, more weary and sad than in the morning when I left Thomas Auld’s for the home of Mr. Covey. I was bare-footed and bare-headed, and in my shirt sleeves. The way was through bogs and briers, and I tore my feet often during the journey. I was full five hours in going the seven or eight miles; partly, because of the difficulties of the way, and partly, because of the feebleness induced by my illness, bruises and loss of blood. On gaining my master’s store, I presented an appearance of wretchedness and woe, fitted to move any but a heart of stone. From the crown of my head to the sole of my feet, there were marks of blood. My hair was all clotted with dust and blood, and the back of my shirt was literally stiff with the same. Briers and thorns had scarred and torn my feet and legs, leaving blood marks there. Had I escaped from a den of tigers, I could not have looked worse than I did on reaching St. Michael’s. In this unhappy plight, I appeared before my professedly _Christian_ master, humbly to invoke the interposition of his power and authority, to protect me from further abuse and violence. I had begun to hope, during the latter part of my tedious journey toward St. Michael’s, that Capt. Auld would now show himself in a nobler light than I had ever before seen him. I was disappointed. I had jumped from a sinking ship into the sea; I had fled from the tiger to something worse. I told him all the circumstances, as well as I could; how I was endeavoring to please Covey; how hard I was at work in the present instance; how unwilling I sunk down under the heat, toil and pain; the brutal manner in which Covey had kicked me in the side; the gash cut in my head; my hesitation about troubling him (Capt. Auld) with complaints; but, that now I felt it would not be best longer to conceal from him the outrages committed on me from time to time by Covey. At first, master Thomas seemed somewhat affected by the story of my wrongs, but he soon repressed his feelings and became cold as iron. It was impossible—as I stood before him at the first—for him to seem indifferent. I distinctly saw his human nature asserting its conviction against the slave system, which made cases like mine _possible;_ but, as I have said, humanity fell before the systematic tyranny of slavery. He first walked the floor, apparently much agitated by my story, and the sad spectacle I presented; but, presently, it was _his_ turn to talk. He began moderately, by finding excuses for Covey, and ending with a full justification of him, and a passionate condemnation of me. “He had no doubt I deserved the flogging. He did not believe I was sick; I was only endeavoring to get rid of work. My dizziness was laziness, and Covey did right to flog me, as he had done.” After thus fairly annihilating me, and rousing himself by his own eloquence, he fiercely demanded what I wished _him_ to do in the case!

With such a complete knock-down to all my hopes, as he had given me, and feeling, as I did, my entire subjection to his power, I had very little heart to reply. I must not affirm my innocence of the allegations which he had piled up against me; for that would be impudence, and would probably call down fresh violence as well as wrath upon me. The guilt of a slave is always, and everywhere,

presumed; and the innocence of the slaveholder or the slave employer, is always asserted. The word of the slave, against this presumption, is generally treated as impudence, worthy of punishment. “Do you contradict me, you rascal?” is a final silencer of counter statements from the lips of a slave.

Calming down a little in view of my silence and hesitation, and, perhaps, from a rapid glance at the picture of misery I presented, he inquired again, “what I would have him do?” Thus invited a second time, I told Master Thomas I wished him to allow me to get a new home and to find a new master; that, as sure as I went back to live with Mr. Covey again, I should be killed by him; that he would never forgive my coming to him (Capt. Auld) with a complaint against him (Covey); that, since I had lived with him, he almost crushed my spirit, and I believed that he would ruin me for future service; that my life was not safe in his hands. This, Master Thomas _(my brother in the church)_ regarded as “nonsence(sic).” “There was no danger of Mr. Covey’s killing me; he was a good man, industrious and religious, and he would not think of removing me from that home; besides,” said he and this I found was the most distressing thought of all to him—“if you should leave Covey now, that your year has but half expired, I should lose your wages for the entire year. You belong to Mr. Covey for one year, and you _must go back_ to him, come what will. You must not trouble me with any more stories about Mr. Covey; and if you do not go immediately home, I will get hold of you myself.” This was just what I expected, when I found he had _prejudged_ the case against me. “But, Sir,” I said, “I am sick and tired, and I cannot get home to-night.” At this, he again relented, and finally he allowed me to remain all night at St. Michael’s; but said I must be off early in the morning, and concluded his directions by making me swallow a huge dose of _epsom salts_—about the only medicine ever administered to slaves.

It was quite natural for Master Thomas to presume I was feigning sickness to escape work, for he probably thought that were _he_ in the place of a slave with no wages for his work, no praise for well doing, no motive for toil but the lash—he would try every possible scheme by which to escape labor. I say I have no doubt of this; the reason is, that there are not, under the whole heavens, a set of men who cultivate such an intense dread of labor as do the slaveholders. The charge of laziness against the slave is ever on their lips, and is the standing apology for every species of cruelty and brutality. These men literally “bind heavy burdens, grievous to be borne, and lay them on men’s shoulders; but they, themselves, will not move them with one of their fingers.”

My kind readers shall have, in the next chapter—what they were led, perhaps, to expect to find in this—namely: an account of my partial disenthrallment from the tyranny of Covey, and the marked change which it brought about.

CHAPTER XVII. _The Last Flogging_

A SLEEPLESS NIGHT—RETURN TO COVEY’S—PURSUED BY COVEY—THE CHASE DEFEATED—VENGEANCE POSTPONED—MUSINGS IN THE WOODS—THE ALTERNATIVE—DEPLORABLE SPECTACLE—NIGHT IN THE WOODS—EXPECTED ATTACK—ACCOSTED BY SANDY, A FRIEND, NOT A HUNTER—SANDY’S HOSPITALITY—THE “ASH CAKE” SUPPER—THE INTERVIEW WITH SANDY—HIS ADVICE—SANDY A CONJURER AS WELL AS A CHRISTIAN—THE MAGIC ROOT—STRANGE MEETING WITH COVEY—HIS MANNER—COVEY’S SUNDAY FACE—MY DEFENSIVE RESOLVE—THE FIGHT—THE VICTORY, AND ITS RESULTS.

Sleep itself does not always come to the relief of the weary in body, and the broken in spirit; especially when past troubles only foreshadow coming disasters. The last hope had been extinguished. My master, who I did not venture to hope would protect me as _a man_, had even now refused to protect me as _his property;_ and had cast me back, covered with reproaches and bruises, into the hands of a stranger to that mercy which was the soul of the religion he professed. May the reader never spend such a night as that allotted to me, previous to the morning which was to herald my return to the den of horrors from which I had made a temporary escape.

I remained all night—sleep I did not—at St. Michael’s; and in the morning (Saturday) I started off, according to the order of Master Thomas, feeling that I had no friend on earth, and doubting if I had one in heaven. I reached Covey’s about nine o’clock; and just as I stepped into the field, before I had reached the house, Covey, true to his snakish habits, darted out at me from a fence corner, in which he had secreted himself, for the purpose of securing me. He was amply provided with a cowskin and a rope; and he evidently intended to _tie me up_, and to wreak his vengeance on me to the fullest extent. I should have been an easy prey, had he succeeded in getting his hands upon me, for I had taken no refreshment since noon on Friday; and this, together with the pelting, excitement, and the loss of blood, had reduced my strength. I, however, darted back into the woods, before the ferocious hound could get hold of me, and buried myself in a thicket, where he lost sight of me. The corn-field afforded me cover, in getting to the woods. But for the tall corn, Covey would have overtaken me, and made me his captive. He seemed very much chagrined that he

did not catch me, and gave up the chase, very reluctantly; for I could see his angry movements, toward the house from which he had sallied, on his foray.

Well, now I am clear of Covey, and of his wrathful lash, for present. I am in the wood, buried in its somber gloom, and hushed in its solemn silence; hid from all human eyes; shut in with nature and nature's God, and absent from all human contrivances. Here was a good place to pray; to pray for help for deliverance—a prayer I had often made before. But how could I pray? Covey could pray—Capt. Auld could pray—I would fain pray; but doubts (arising partly from my own neglect of the means of grace, and partly from the sham religion which everywhere prevailed, cast in my mind a doubt upon all religion, and led me to the conviction that prayers were unavailing and delusive) prevented my embracing the opportunity, as a religious one. Life, in itself, had almost become burdensome to me. All my outward relations were against me; I must stay here and starve (I was already hungry) or go home to Covey's, and have my flesh torn to pieces, and my spirit humbled under the cruel lash of Covey. This was the painful alternative presented to me. The day was long and irksome. My physical condition was deplorable. I was weak, from the toils of the previous day, and from the want of food and rest; and had been so little concerned about my appearance, that I had not yet washed the blood from my garments. I was an object of horror, even to myself. Life, in Baltimore, when most oppressive, was a paradise to this. What had I done, what had my parents done, that such a life as this should be mine? That day, in the woods, I would have exchanged my manhood for the brutehood of an ox.

Night came. I was still in the woods, unresolved what to do. Hunger had not yet pinched me to the point of going home, and I laid myself down in the leaves to rest; for I had been watching for hunters all day, but not being molested during the day, I expected no disturbance during the night. I had come to the conclusion that Covey relied upon hunger to drive me home; and in this I was quite correct—the facts showed that he had made no effort to catch me, since morning.

During the night, I heard the step of a man in the woods. He was coming toward the place where I lay. A person lying still has the advantage over one walking in the woods, in the day time, and this advantage is much greater at night. I was not able to engage in a physical struggle, and I had recourse to the common resort of the weak. I hid myself in the leaves to prevent discovery. But, as the night rambler in the woods drew nearer, I found him to be a _friend_, not an enemy; it was a slave of Mr. William Groomes, of Easton, a kind hearted fellow, named "Sandy." Sandy lived with Mr. Kemp that year, about four miles from St. Michael's. He, like myself had been hired out by the year; but, unlike myself, had not been hired out to be broken. Sandy was the husband of a free woman, who lived in the lower part of _"Potpie Neck,"_ and he was now on his way through the woods, to see her, and to spend the Sabbath with her.

As soon as I had ascertained that the disturber of my solitude was not an enemy, but the good-hearted Sandy—a man as famous among the slaves of the neighborhood for his good nature, as for his good sense I came out from my hiding place, and made myself known to him. I explained the circumstances of the past two days, which had driven me to the woods, and he deeply compassionated my distress. It was a bold thing for him to shelter me, and I could not ask him to do so; for, had I been found in his hut, he would have suffered the penalty of thirty-nine lashes on his bare back, if not something worse. But Sandy was too generous to permit the fear of punishment to prevent his relieving a brother bondman from hunger and exposure; and, therefore, on his own motion, I accompanied him to his home, or rather to the home of his wife—for the house and lot were hers. His wife was called up—for it was now about midnight—a fire was made, some Indian meal was soon mixed with salt and water, and an ash cake was baked in a hurry to relieve my hunger. Sandy's wife was not behind him in kindness—both seemed to esteem it a privilege to succor me; for, although I was hated by Covey and by my master, I was loved by the colored people, because _they_ thought I was hated for my knowledge, and persecuted because I was feared. I was the _only_ slave _now_ in that region who could read and write. There had been one other man, belonging to Mr. Hugh Hamilton, who could read (his name was "Jim"), but he, poor fellow, had, shortly after my coming into the neighborhood, been sold off to the far south. I saw Jim ironed, in the cart, to be carried to Easton for sale—pinioned like a yearling for the slaughter. My knowledge was now the pride of my brother slaves; and, no doubt, Sandy felt something of the general interest in me on that account. The supper was soon ready, and though I have feasted since, with honorables, lord mayors and aldermen, over the sea, my supper on ash cake and cold water, with Sandy, was the meal, of all my life, most sweet to my taste, and now most vivid in my memory.

Supper over, Sandy and I went into a discussion of what was _possible_ for me, under the perils and hardships which now overshadowed my path. The question was, must I go back to Covey, or must I now tempt to run away? Upon a careful survey, the latter was found to be impossible; for I was on a narrow neck of land, every avenue from which would bring me in sight of pursuers. There was the Chesapeake bay to the right, and "Pot-pie" river to the left, and St. Michael's and its neighborhood occupying the only space through which there was any retreat.

I found Sandy an old advisor. He was not only a religious man, but he professed to believe in a system for which I have no name. He was a genuine African, and had inherited some of the so-called magical powers, said to be possessed by African and eastern nations. He told me that he could help me; that, in those very woods, there was an herb, which in the morning might be found, possessing all the powers required for my protection (I put his thoughts in my own language); and that, if I would take his advice, he would procure me the root of the herb of which he spoke. He told me further, that if I would take that root and wear it on my right side, it would be impossible for Covey to strike me a blow; that with this root about my person, no white man could whip me. He said he had carried it for years, and that he had fully tested its virtues. He had never received a blow from a slaveholder since he carried it; and he never expected to receive one, for he always meant to carry that root as a protection. He knew Covey well, for Mrs. Covey was the daughter of Mr. Kemp; and he (Sandy) had heard of the barbarous treatment to which I was subjected, and he wanted to do something for me.

Now all this talk about the root, was to me, very absurd and ridiculous, if not positively sinful. I at first rejected the idea that the simple carrying a root on my right side (a root, by the way, over which I walked every time I went into the woods) could possess any such magic power as he ascribed to it, and I was, therefore, not disposed to cumber my pocket with it. I had a positive aversion to all pretenders to _“divination.”_ It was beneath one of my intelligence to countenance such dealings with the devil, as this power implied. But, with all my learning—it was really precious little—Sandy was more than a match for me. “My book learning,” he said, “had not kept Covey off me” (a powerful argument just then) and he entreated me, with flashing eyes, to try this. If it did me no good, it could do me no harm, and it would cost me nothing, any way. Sandy was so earnest, and so confident of the good qualities of this weed, that, to please him, rather than from any conviction of its excellence, I was induced to take it. He had been to me the good Samaritan, and had, almost providentially, found me, and helped me when I could not help myself; how did I know but that the hand of the Lord was in it? With thoughts of this sort, I took the roots from Sandy, and put them in my right hand pocket.

This was, of course, Sunday morning. Sandy now urged me to go home, with all speed, and to walk up bravely to the house, as though nothing had happened. I saw in Sandy too deep an insight into human nature, with all his superstition, not to have some respect for his advice; and perhaps, too, a slight gleam or shadow of his superstition had fallen upon me. At any rate, I started off toward Covey’s, as directed by Sandy. Having, the previous night, poured my griefs into Sandy’s ears, and got him enlisted in my behalf, having made his wife a sharer in my sorrows, and having, also, become well refreshed by sleep and food, I moved off, quite courageously, toward the much dreaded Covey’s. Singularly enough, just as I entered his yard gate, I met him and his wife, dressed in their Sunday best—looking as smiling as angels—on their way to church. The manner of Covey astonished me. There was something really benignant in his countenance. He spoke to me as never before; told me that the pigs had got into the lot, and he wished me to drive them out; inquired how I was, and seemed an altered man. This extraordinary conduct of Covey, really made me begin to think that Sandy’s herb had more virtue in it than I, in my pride, had been willing to allow; and, had the day been other than Sunday, I should have attributed Covey’s altered manner solely to the magic power of the root. I suspected, however, that the _Sabbath_, and not the _root_, was the real explanation of Covey’s manner. His religion hindered him from breaking the Sabbath, but not from breaking my skin. He had more respect for the _day_ than for the _man_, for whom the day was mercifully given; for while he would cut and slash my body during the week, he would not hesitate, on Sunday, to teach me the value of my soul, or the way of life and salvation by Jesus Christ.

All went well with me till Monday morning; and then, whether the root had lost its virtue, or whether my tormentor had gone deeper into the black art than myself (as was sometimes said of him), or whether he had obtained a special indulgence, for his faithful Sabbath day’s worship, it is not necessary for me to know, or to inform the reader; but, this I _may_ say—the pious and benignant smile which graced Covey’s face on _Sunday_, wholly disappeared on _Monday_. Long before daylight, I was called up to go and feed, rub, and curry the horses. I obeyed the call, and would have so obeyed it, had it been made at an earilier(sic) hour, for I had brought my mind to a firm resolve, during that Sunday’s reflection, viz: to obey every order, however unreasonable, if it were possible, and, if Mr. Covey should then undertake to beat me, to defend and protect myself to the best of my ability. My religious views on the subject of resisting my master, had suffered a serious shock, by the savage persecution to which I had been subjected, and my hands were no longer tied by my religion. Master Thomas’s indifference had served the last link. I had now to this extent “backslidden” from this point in the slave’s religious creed; and I soon had occasion to make my fallen state known to my Sunday-pious brother, Covey.

Whilst I was obeying his order to feed and get the horses ready for the field, and when in the act of going up the stable loft for the purpose of throwing down some blades, Covey sneaked into the stable, in his peculiar snake-like way, and seizing me suddenly by the leg, he brought me to the stable floor, giving my newly mended body a fearful jar. I now forgot my roots, and remembered my

pledge to _stand up in my own defense_. The brute was endeavoring skillfully to get a slip-knot on my legs, before I could draw up my feet. As soon as I found what he was up to, I gave a sudden spring (my two day's rest had been of much service to me,) and by that means, no doubt, he was able to bring me to the floor so heavily. He was defeated in his plan of tying me. While down, he seemed to think he had me very securely in his power. He little thought he was—as the rowdies say—"in" for a "rough and tumble" fight; but such was the fact. Whence came the daring spirit necessary to grapple with a man who, eight-and-forty hours before, could, with his slightest word have made me tremble like a leaf in a storm, I do not know; at any rate, _I was resolved to fight_, and, what was better still, I was actually hard at it. The fighting madness had come upon me, and I found my strong fingers firmly attached to the throat of my cowardly tormentor; as heedless of consequences, at the moment, as though we stood as equals before the law. The very color of the man was forgotten. I felt as supple as a cat, and was ready for the snakish creature at every turn. Every blow of his was parried, though I dealt no blows in turn. I was strictly on the _defensive_, preventing him from injuring me, rather than trying to injure him. I flung him on the ground several times, when he meant to have hurled me there. I held him so firmly by the throat, that his blood followed my nails. He held me, and I held him.

All was fair, thus far, and the contest was about equal. My resistance was entirely unexpected, and Covey was taken all aback by it, for he trembled in every limb. _"Are you going to resist_, you scoundrel?" said he. To which, I returned a polite _"Yes sir;"_ steadily gazing my interrogator in the eye, to meet the first approach or dawning of the blow, which I expected my answer would call forth. But, the conflict did not long remain thus equal. Covey soon cried out lustily for help; not that I was obtaining any marked advantage over him, or was injuring him, but because he was gaining none over me, and was not able, single handed, to conquer me. He called for his cousin Hughs, to come to his assistance, and now the scene was changed. I was compelled to give blows, as well as to parry them; and, since I was, in any case, to suffer for resistance, I felt (as the musty proverb goes) that "I might as well be hanged for an old sheep as a lamb." I was still _defensive_ toward Covey, but _aggressive_ toward Hughs; and, at the first approach of the latter, I dealt a blow, in my desperation, which fairly sickened my youthful assailant. He went off, bending over with pain, and manifesting no disposition to come within my reach again. The poor fellow was in the act of trying to catch and tie my right hand, and while flattering himself with success, I gave him the kick which sent him staggering away in pain, at the same time that I held Covey with a firm hand.

Taken completely by surprise, Covey seemed to have lost his usual strength and coolness. He was frightened, and stood puffing and blowing, seemingly unable to command words or blows. When he saw that poor Hughes was standing half bent with pain—his courage quite gone the cowardly tyrant asked if I "meant to persist in my resistance." I told him "_I did mean to resist, come what might_;" that I had been by him treated like a _brute_, during the last six months; and that I should stand it _no longer_. With that, he gave me a shake, and attempted to drag me toward a stick of wood, that was lying just outside the stable door. He meant to knock me down with it; but, just as he leaned over to get the stick, I seized him with both hands by the collar, and, with a vigorous and sudden snatch, I brought my assailant harmlessly, his full length, on the _not_ overclean ground—for we were now in the cow yard. He had selected the place for the fight, and it was but right that he should have all the advantges(sic) of his own selection.

By this time, Bill, the hiredman, came home. He had been to Mr. Hemsley's, to spend the Sunday with his nominal wife, and was coming home on Monday morning, to go to work. Covey and I had been skirmishing from before daybreak, till now, that the sun was almost shooting his beams over the eastern woods, and we were still at it. I could not see where the matter was to terminate. He evidently was afraid to let me go, lest I should again make off to the woods; otherwise, he would probably have obtained arms from the house, to frighten me. Holding me, Covey called upon Bill for assistance. The scene here, had something comic about it. "Bill," who knew _precisely_ what Covey wished him to do, affected ignorance, and pretended he did not know what to do. "What shall I do, Mr. Covey," said Bill. "Take hold of him—take hold of him!" said Covey. With a toss of his head, peculiar to Bill, he said, "indeed, Mr. Covey I want to go to work." _"This is_ your work," said Covey; "take hold of him." Bill replied, with spirit, "My master hired me here, to work, and _not_ to help you whip Frederick." It was now my turn to speak. "Bill," said I, "don't put your hands on me." To which he replied, "My GOD! Frederick, I ain't goin' to tech ye," and Bill walked off, leaving Covey and myself to settle our matters as best we might.

But, my present advantage was threatened when I saw Caroline (the slave-woman of Covey) coming to the cow yard to milk, for she was a powerful woman, and could have mastered me very easily, exhausted as I now was. As soon as she came into the yard, Covey attempted to rally her to his aid. Strangely—and, I may add, fortunately—Caroline was in no humor to take a hand in any such sport. We were all in open rebellion, that morning. Caroline answered the command of her master to _"take hold of me,"_ precisely as Bill had answered, but in _her_, it was at greater peril so to answer; she was the slave of Covey, and he could do what he pleased with her. It was _not_ so with Bill, and Bill knew it. Samuel Harris, to whom Bill belonged, did not allow his slaves to be

beaten, unless they were guilty of some crime which the law would punish. But, poor Caroline, like myself, was at the mercy of the merciless Covey; nor did she escape the dire effects of her refusal. He gave her several sharp blows.

Covey at length (two hours had elapsed) gave up the contest. Letting me go, he said—puffing and blowing at a great rate—"Now, you scoundrel, go to your work; I would not have whipped you half so much as I have had you not resisted." The fact was, _he had not whipped me at all_. He had not, in all the scuffle, drawn a single drop of blood from me. I had drawn blood from him; and, even without this satisfaction, I should have been victorious, because my aim had not been to injure him, but to prevent his injuring me.

During the whole six months that I lived with Covey, after this transaction, he never laid on me the weight of his finger in anger. He would, occasionally, say he did not want to have to get hold of me again—a declaration which I had no difficulty in believing; and I had a secret feeling, which answered, "You need not wish to get hold of me again, for you will be likely to come off worse in a second fight than you did in the first."

Well, my dear reader, this battle with Mr. Covey—undignified as it was, and as I fear my narration of it is—was the turning point in my _"life as a slave_." It rekindled in my breast the smouldering embers of liberty; it brought up my Baltimore dreams, and revived a sense of my own manhood. I was a changed being after that fight. I was _nothing_ before; I WAS A MAN NOW. It recalled to life my crushed self-respect and my self-confidence, and inspired me with a renewed determination to be A FREEMAN. A man, without force, is without the essential dignity of humanity. Human nature is so constituted, that it cannot _honor_ a helpless man, although it can _pity_ him; and even this it cannot do long, if the signs of power do not arise.

He can only understand the effect of this combat on my spirit, who has himself incurred something, hazarded something, in repelling the unjust and cruel aggressions of a tyrant. Covey was a tyrant, and a cowardly one, withal. After resisting him, I felt as I had never felt before. It was a resurrection from the dark and pestiferous tomb of slavery, to the heaven of comparative freedom. I was no longer a servile coward, trembling under the frown of a brother worm of the dust, but, my long-cowed spirit was roused to an attitude of manly independence. I had reached the point, at which I was _not afraid to die_. This spirit made me a freeman in _fact_, while I remained a slave in _form_. When a slave cannot be flogged he is more than half free. He has a domain as broad as his own manly heart to defend, and he is really _"a power on earth_." While slaves prefer their lives, with flogging, to instant death, they will always find Christians enough, like unto Covey, to accommodate that preference. From this time, until that of my escape from slavery, I was never fairly whipped. Several attempts were made to whip me, but they were always unsuccessful. Bruises I did get, as I shall hereafter inform the reader; but the case I have been describing, was the end of the brutification to which slavery had subjected me.

The reader will be glad to know why, after I had so grievously offended Mr. Covey, he did not have me taken in hand by the authorities; indeed, why the law of Maryland, which assigns hanging to the slave who resists his master, was not put in force against me; at any rate, why I was not taken up, as is usual in such cases, and publicly whipped, for an example to other slaves, and as a means of deterring me from committing the same offense again. I confess, that the easy manner in which I got off, for a long time, a surprise to me, and I cannot, even now, fully explain the cause.

The only explanation I can venture to suggest, is the fact, that Covey was, probably, ashamed to have it known and confessed that he had been mastered by a boy of sixteen. Mr. Covey enjoyed the unbounded and very valuable reputation, of being a first rate overseer and _Negro breaker_. By means of this reputation, he was able to procure his hands for _very trifling_ compensation, and with very great ease. His interest and his pride mutually suggested the wisdom of passing the matter by, in silence. The story that he had undertaken to whip a lad, and had been resisted, was, of itself, sufficient to damage him; for his bearing should, in the estimation of slaveholders, be of that imperial order that should make such an occurrence _impossible_. I judge from these circumstances, that Covey deemed it best to give me the go-by. It is, perhaps, not altogether creditable to my natural temper, that, after this conflict with Mr. Covey, I did, at times, purposely aim to provoke him to an attack, by refusing to keep with the other hands in the field, but I could never bully him to another battle. I had made up my mind to do him serious damage, if he ever again attempted to lay violent hands on me.

Hereditary bondmen, know ye not Who would be free, themselves must strike the blow?

CHAPTER XVIII. _New Relations and Duties_

CHANGE OF MASTERS—BENEFITS DERIVED BY THE CHANGE—FAME OF THE FIGHT WITH COVEY—RECKLESS UNCONCERN—MY ABHORRENCE OF SLAVERY—ABILITY TO READ A CAUSE OF PREJUDICE—THE HOLIDAYS—HOW

SPENT—SHARP HIT AT SLAVERY—EFFECTS OF HOLIDAYS—A DEVICE OF SLAVERY—DIFFERENCE BETWEEN COVEY AND FREELAND—AN IRRELIGIOUS MASTER PREFERRED TO A RELIGIOUS ONE—CATALOGUE OF FLOGGABLE OFFENSES—HARD LIFE AT COVEY'S USEFUL—IMPROVED CONDITION NOT FOLLOWED BY CONTENTMENT—CONGENIAL SOCIETY AT FREELAND'S—SABBATH SCHOOL INSTITUTED—SECRECY NECESSARY—AFFECTIONATE RELATIONS OF TUTOR AND PUPILS—CONFIDENCE AND FRIENDSHIP AMONG SLAVES—I DECLINE PUBLISHING PARTICULARS OF CONVERSATIONS WITH MY FRIENDS—SLAVERY THE INVITER OF VENGEANCE.

My term of actual service to Mr. Edward Covey ended on Christmas day, 1834. I gladly left the snakish Covey, although he was now as gentle as a lamb. My home for the year 1835 was already secured—my next master was already selected. There is always more or less excitement about the matter of changing hands, but I had become somewhat reckless. I cared very little into whose hands I fell—I meant to fight my way. Despite of Covey, too, the report got abroad, that I was hard to whip; that I was guilty of kicking back; that though generally a good tempered Negro, I sometimes "_got the devil in me_." These sayings were rife in Talbot county, and they distinguished me among my servile brethren. Slaves, generally, will fight each other, and die at each other's hands; but there are few who are not held in awe by a white man. Trained from the cradle up, to think and feel that their masters are superior, and invested with a sort of sacredness, there are few who can outgrow or rise above the control which that sentiment exercises. I had now got free from it, and the thing was known. One bad sheep will spoil a whole flock. Among the slaves, I was a bad sheep. I hated slavery, slaveholders, and all pertaining to them; and I did not fail to inspire others with the same feeling, wherever and whenever opportunity was presented. This made me a marked lad among the slaves, and a suspected one among the slaveholders. A knowledge of my ability to read and write, got pretty widely spread, which was very much against me.

The days between Christmas day and New Year's, are allowed the slaves as holidays. During these days, all regular work was suspended, and there was nothing to do but to keep fires, and look after the stock. This time was regarded as our own, by the grace of our masters, and we, therefore used it, or abused it, as we pleased. Those who had families at a distance, were now expected to visit them, and to spend with them the entire week. The younger slaves, or the unmarried ones, were expected to see to the cattle, and attend to incidental duties at home. The holidays were variously spent. The sober, thinking and industrious ones of our number, would employ themselves in manufacturing corn brooms, mats, horse collars and baskets, and some of these were very well made. Another class spent their time in hunting opossums, coons, rabbits, and other game. But the majority spent the holidays in sports, ball playing, wrestling, boxing, running foot races, dancing, and drinking whisky; and this latter mode of spending the time was generally most agreeable to their masters. A slave who would work during the holidays, was thought, by his master, undeserving of holidays. Such an one had rejected the favor of his master. There was, in this simple act of continued work, an accusation against slaves; and a slave could not help thinking, that if he made three dollars during the holidays, he might make three hundred during the year. Not to be drunk during the holidays, was disgraceful; and he was esteemed a lazy and improvident man, who could not afford to drink whisky during Christmas.

The fiddling, dancing and _"jubilee beating_," was going on in all directions. This latter performance is strictly southern. It supplies the place of a violin, or of other musical instruments, and is played so easily, that almost every farm has its "Juba" beater. The performer improvises as he beats, and sings his merry songs, so ordering the words as to have them fall pat with the movement of his hands. Among a mass of nonsense and wild frolic, once in a while a sharp hit is given to the meanness of slaveholders. Take the following, for an example:

We raise de wheat, Dey gib us de corn; We bake de bread, Dey gib us de cruss; We sif de meal, Dey gib us de huss; We peal de meat, Dey gib us de skin, And dat's de way Dey takes us in. We skim de pot, Dey gib us the liquor, And say dat's good enough for nigger. Walk over! walk over! Tom butter and de fat; Poor nigger you can't get over dat; Walk over!

This is not a bad summary of the palpable injustice and fraud of slavery, giving—as it does—to the lazy and idle, the comforts which God designed should be given solely to the honest laborer. But to the holiday's.

Judging from my own observation and experience, I believe these holidays to be among the most effective means, in the hands of slaveholders, of keeping down the spirit of insurrection among the slaves.

To enslave men, successfully and safely, it is necessary to have their minds occupied with thoughts and aspirations short of the liberty of which they are deprived. A certain degree of attainable good must be kept before them. These holidays serve the purpose of keeping the minds of the slaves occupied with prospective pleasure, within the limits of slavery. The young man can go wooing;

the married man can visit his wife; the father and mother can see their children; the industrious and money loving can make a few dollars; the great wrestler can win laurels; the young people can meet, and enjoy each other's society; the drunken man can get plenty of whisky; and the religious man can hold prayer meetings, preach, pray and exhort during the holidays. Before the holidays, these are pleasures in prospect; after the holidays, they become pleasures of memory, and they serve to keep out thoughts and wishes of a more dangerous character. Were slaveholders at once to abandon the practice of allowing their slaves these liberties, periodically, and to keep them, the year round, closely confined to the narrow circle of their homes, I doubt not that the south would blaze with insurrections. These holidays are conductors or safety valves to carry off the explosive elements inseparable from the human mind, when reduced to the condition of slavery. But for these, the rigors of bondage would become too severe for endurance, and the slave would be forced up to dangerous desperation. Woe to the slaveholder when he undertakes to hinder or to prevent the operation of these electric conductors. A succession of earthquakes would be less destructive, than the insurrectionary fires which would be sure to burst forth in different parts of the south, from such interference.

Thus, the holidays, became part and parcel of the gross fraud, wrongs and inhumanity of slavery. Ostensibly, they are institutions of benevolence, designed to mitigate the rigors of slave life, but, practically, they are a fraud, instituted by human selfishness, the better to secure the ends of injustice and oppression. The slave's happiness is not the end sought, but, rather, the master's safety. It is not from a generous unconcern for the slave's labor that this cessation from labor is allowed, but from a prudent regard to the safety of the slave system. I am strengthened in this opinion, by the fact, that most slaveholders like to have their slaves spend the holidays in such a manner as to be of no real benefit to the slaves. It is plain, that everything like rational enjoyment among the slaves, is frowned upon; and only those wild and low sports, peculiar to semi-civilized people, are encouraged. All the license allowed, appears to have no other object than to disgust the slaves with their temporary freedom, and to make them as glad to return to their work, as they were to leave it. By plunging them into exhausting depths of drunkenness and dissipation, this effect is almost certain to follow. I have known slaveholders resort to cunning tricks, with a view of getting their slaves deplorably drunk. A usual plan is, to make bets on a slave, that he can drink more whisky than any other; and so to induce a rivalry among them, for the mastery in this degradation. The scenes, brought about in this way, were often scandalous and loathsome in the extreme. Whole multitudes might be found stretched out in brutal drunkenness, at once helpless and disgusting. Thus, when the slave asks for a few hours of virtuous freedom, his cunning master takes advantage of his ignorance, and cheers him with a dose of vicious and revolting dissipation, artfully labeled with the name of LIBERTY. We were induced to drink, I among the rest, and when the holidays were over, we all staggered up from our filth and wallowing, took a long breath, and went away to our various fields of work; feeling, upon the whole, rather glad to go from that which our masters artfully deceived us into the belief was freedom, back again to the arms of slavery. It was not what we had taken it to be, nor what it might have been, had it not been abused by us. It was about as well to be a slave to _master_, as to be a slave to _rum_ and _whisky._

I am the more induced to take this view of the holiday system, adopted by slaveholders, from what I know of their treatment of slaves, in regard to other things. It is the commonest thing for them to try to disgust their slaves with what they do not want them to have, or to enjoy. A slave, for instance, likes molasses; he steals some; to cure him of the taste for it, his master, in many cases, will go away to town, and buy a large quantity of the _poorest_ quality, and set it before his slave, and, with whip in hand, compel him to eat it, until the poor fellow is made to sicken at the very thought of molasses. The same course is often adopted to cure slaves of the disagreeable and inconvenient practice of asking for more food, when their allowance has failed them. The same disgusting process works well, too, in other things, but I need not cite them. When a slave is drunk, the slaveholder has no fear that he will plan an insurrection; no fear that he will escape to the north. It is the sober, thinking slave who is dangerous, and needs the vigilance of his master, to keep him a slave. But, to proceed with my narrative.

On the first of January, 1835, I proceeded from St. Michael's to Mr. William Freeland's, my new home. Mr. Freeland lived only three miles from St. Michael's, on an old worn out farm, which required much labor to restore it to anything like a self-supporting establishment.

I was not long in finding Mr. Freeland to be a very different man from Mr. Covey. Though not rich, Mr. Freeland was what may be called a well-bred southern gentleman, as different from Covey, as a well-trained and hardened Negro breaker is from the best specimen of the first families of the south. Though Freeland was a slaveholder, and shared many of the vices of his class, he seemed alive to the sentiment of honor. He had some sense of justice, and some feelings of humanity. He was fretful, impulsive and passionate, but I must do him the justice to say, he was free from the mean and selfish characteristics which distinguished the creature from which I had now, happily, escaped. He was open, frank, imperative, and practiced no concealments, disdaining to play the spy. In all this, he was the opposite of the crafty Covey.

Among the many advantages gained in my change from Covey's to Freeland's—startling as the statement may be—was the fact that the latter gentleman made no profession of religion. I assert _most unhesitatingly_, that the religion of the south—as I have observed it and proved it—is a mere covering for the most horrid crimes; the justifier of the most appalling barbarity; a sanctifier of the most hateful frauds; and a secure shelter, under which the darkest, foulest, grossest, and most infernal abominations fester and flourish. Were I again to be reduced to the condition of a slave, _next_ to that calamity, I should regard the fact of being the slave of a religious slaveholder, the greatest that could befall me. For all slaveholders with whom I have ever met, religious slaveholders are the worst. I have found them, almost invariably, the vilest, meanest and basest of their class. Exceptions there may be, but this is true of religious slaveholders, _as a class_. It is not for me to explain the fact. Others may do that; I simply state it as a fact, and leave the theological, and psychological inquiry, which it raises, to be decided by others more competent than myself. Religious slaveholders, like religious persecutors, are ever extreme in their malice and violence. Very near my new home, on an adjoining farm, there lived the Rev. Daniel Weeden, who was both pious and cruel after the real Covey pattern. Mr. Weeden was a local preacher of the Protestant Methodist persuasion, and a most zealous supporter of the ordinances of religion, generally. This Weeden owned a woman called "Ceal," who was a standing proof of his mercilessness. Poor Ceal's back, always scantily clothed, was kept literally raw, by the lash of this religious man and gospel minister. The most notoriously wicked man—so called in distinction from church members—could hire hands more easily than this brute. When sent out to find a home, a slave would never enter the gates of the preacher Weeden, while a sinful sinner needed a hand. Be have ill, or behave well, it was the known maxim of Weeden, that it is the duty of a master to use the lash. If, for no other reason, he contended that this was essential to remind a slave of his condition, and of his master's authority. The good slave must be whipped, to be _kept_ good, and the bad slave must be whipped, to be _made_ good. Such was Weeden's theory, and such was his practice. The back of his slave-woman will, in the judgment, be the swiftest witness against him.

While I am stating particular cases, I might as well immortalize another of my neighbors, by calling him by name, and putting him in print. He did not think that a "chiel" was near, "taking notes," and will, doubtless, feel quite angry at having his character touched off in the ragged style of a slave's pen. I beg to introduce the reader to REV. RIGBY HOPKINS. Mr. Hopkins resides between Easton and St. Michael's, in Talbot county, Maryland. The severity of this man made him a perfect terror to the slaves of his neighborhood. The peculiar feature of his government, was, his system of whipping slaves, as he said, _in advance_ of deserving it. He always managed to have one or two slaves to whip on Monday morning, so as to start his hands to their work, under the inspiration of a new assurance on Monday, that his preaching about kindness, mercy, brotherly love, and the like, on Sunday, did not interfere with, or prevent him from establishing his authority, by the cowskin. He seemed to wish to assure them, that his tears over poor, lost and ruined sinners, and his pity for them, did not reach to the blacks who tilled his fields. This saintly Hopkins used to boast, that he was the best hand to manage a Negro in the county. He whipped for the smallest offenses, by way of preventing the commission of large ones.

The reader might imagine a difficulty in finding faults enough for such frequent whipping. But this is because you have no idea how easy a matter it is to offend a man who is on the look-out for offenses. The man, unaccustomed to slaveholding, would be astonished to observe how many _foggable_ offenses there are in the slaveholder's catalogue of crimes; and how easy it is to commit any one of them, even when the slave least intends it. A slaveholder, bent on finding fault, will hatch up a dozen a day, if he chooses to do so, and each one of these shall be of a punishable description. A mere look, word, or motion, a mistake, accident, or want of power, are all matters for which a slave may be whipped at any time. Does a slave look dissatisfied with his condition? It is said, that he has the devil in him, and it must be whipped out. Does he answer _loudly_, when spoken to by his master, with an air of self-consciousness? Then, must he be taken down a button-hole lower, by the lash, well laid on. Does he forget, and omit to pull off his hat, when approaching a white person? Then, he must, or may be, whipped for his bad manners. Does he ever venture to vindicate his conduct, when harshly and unjustly accused? Then, he is guilty of impudence, one of the greatest crimes in the social catalogue of southern society. To allow a slave to escape punishment, who has impudently attempted to exculpate himself from unjust charges, preferred against him by some white person, is to be guilty of great dereliction of duty. Does a slave ever venture to suggest a better way of doing a thing, no matter what? He is, altogether, too officious—wise above what is written—and he deserves, even if he does not get, a flogging for his presumption. Does he, while plowing, break a plow, or while hoeing, break a hoe, or while chopping, break an ax? No matter what were the imperfections of the implement broken, or the natural liabilities for breaking, the slave can be whipped for carelessness. The _reverend_ slaveholder could always find something of this sort, to justify him in using the lash several times during the week. Hopkins—like Covey and Weeden—were shunned by slaves who had the privilege (as many had) of finding their own masters at the end of each year; and yet, there was not a man in all that section of country, who made a louder profession of religion, than did MR. RIGBY HOPKINS.

But, to continue the thread of my story, through my experience when at Mr. William Freeland's.

My poor, weather-beaten bark now reached smoother water, and gentler breezes. My stormy life at Covey's had been of service to me. The things that would have seemed very hard, had I gone direct to Mr. Freeland's, from the home of Master Thomas, were now (after the hardships at Covey's) "trifles light as air." I was still a field hand, and had come to prefer the severe labor of the field, to the enervating duties of a house servant. I had become large and strong; and had begun to take pride in the fact, that I could do as much hard work as some of the older men. There is much rivalry among slaves, at times, as to which can do the most work, and masters generally seek to promote such rivalry. But some of us were too wise to race with each other very long. Such racing, we had the sagacity to see, was not likely to pay. We had our times for measuring each other's strength, but we knew too much to keep up the competition so long as to produce an extraordinary day's work. We knew that if, by extraordinary exertion, a large quantity of work was done in one day, the fact, becoming known to the master, might lead him to require the same amount every day. This thought was enough to bring us to a dead halt when over so much excited for the race.

At Mr. Freeland's, my condition was every way improved. I was no longer the poor scape-goat that I was when at Covey's, where every wrong thing done was saddled upon me, and where other slaves were whipped over my shoulders. Mr. Freeland was too just a man thus to impose upon me, or upon any one else.

It is quite usual to make one slave the object of especial abuse, and to beat him often, with a view to its effect upon others, rather than with any expectation that the slave whipped will be improved by it, but the man with whom I now was, could descend to no such meanness and wickedness. Every man here was held individually responsible for his own conduct.

This was a vast improvement on the rule at Covey's. There, I was the general pack horse. Bill Smith was protected, by a positive prohibition made by his rich master, and the command of the rich slaveholder is LAW to the poor one; Hughes was favored, because of his relationship to Covey; and the hands hired temporarily, escaped flogging, except as they got it over my poor shoulders. Of course, this comparison refers to the time when Covey _could_ whip me.

Mr. Freeland, like Mr. Covey, gave his hands enough to eat, but, unlike Mr. Covey, he gave them time to take their meals; he worked us hard during the day, but gave us the night for rest—another advantage to be set to the credit of the sinner, as against that of the saint. We were seldom in the field after dark in the evening, or before sunrise in the morning. Our implements of husbandry were of the most improved pattern, and much superior to those used at Covey's.

Nothwithstanding the improved condition which was now mine, and the many advantages I had gained by my new home, and my new master, I was still restless and discontented. I was about as hard to please by a master, as a master is by slave. The freedom from bodily torture and unceasing labor, had given my mind an increased sensibility, and imparted to it greater activity. I was not yet exactly in right relations. "How be it, that was not first which is spiritual, but that which is natural, and afterward that which is spiritual." When entombed at Covey's, shrouded in darkness and physical wretchedness, temporal wellbeing was the grand _desideratum;_ but, temporal wants supplied, the spirit puts in its claims. Beat and cuff your slave, keep him hungry and spiritless, and he will follow the chain of his master like a dog; but, feed and clothe him well—work him moderately—surround him with physical comfort—and dreams of freedom intrude. Give him a _bad_ master, and he aspires to a _good_ master; give him a good master, and he wishes to become his _own_ master. Such is human nature. You may hurl a man so low, beneath the level of his kind, that he loses all just ideas of his natural position; but elevate him a little, and the clear conception of rights arises to life and power, and leads him onward. Thus elevated, a little, at Freeland's, the dreams called into being by that good man, Father Lawson, when in Baltimore, began to visit me; and shoots from the tree of liberty began to put forth tender buds, and dim hopes of the future began to dawn.

I found myself in congenial society, at Mr. Freeland's. There were Henry Harris, John Harris, Handy Caldwell, and Sandy Jenkins. 6

Henry and John were brothers, and belonged to Mr. Freeland. They were both remarkably bright and intelligent, though neither of them could read. Now for mischief! I had not been long at Freeland's before I was up to my old tricks. I early began to address my companions on the subject of education, and the advantages of intelligence over ignorance, and, as far as I dared, I tried to show the agency of ignorance in keeping men in slavery. Webster's spelling book and the _Columbian Orator_ were looked into again. As summer came on, and the long Sabbath days stretched themselves over our idleness, I became uneasy, and wanted a Sabbath school, in which to exercise my gifts, and to impart the little knowledge of letters which I possessed, to my brother slaves. A house was hardly necessary in the summer time; I could hold my school under the shade of an old oak tree, as well as any where else. The thing was, to get the scholars, and to have them thoroughly imbued with the desire to learn. Two such boys were quickly

secured, in Henry and John, and from them the contagion spread. I was not long bringing around me twenty or thirty young men, who enrolled themselves, gladly, in my Sabbath school, and were willing to meet me regularly, under the trees or elsewhere, for the purpose of learning to read. It was surprising with what ease they provided themselves with spelling books. These were mostly the cast off books of their young masters or mistresses. I taught, at first, on our own farm. All were impressed with the necessity of keeping the matter as private as possible, for the fate of the St. Michael's attempt was notorious, and fresh in the minds of all. Our pious masters, at St. Michael's, must not know that a few of their dusky brothers were learning to read the word of God, lest they should come down upon us with the lash and chain. We might have met to drink whisky, to wrestle, fight, and to do other unseemly things, with no fear of interruption from the saints or sinners of St. Michael's.

But, to meet for the purpose of improving the mind and heart, by learning to read the sacred scriptures, was esteemed a most dangerous nuisance, to be instantly stopped. The slaveholders of St. Michael's, like slaveholders elsewhere, would always prefer to see the slaves engaged in degrading sports, rather than to see them acting like moral and accountable beings.

Had any one asked a religious white man, in St. Michael's, twenty years ago, the names of three men in that town, whose lives were most after the pattern of our Lord and Master, Jesus Christ, the first three would have been as follows:

GARRISON WEST, _Class Leader_. WRIGHT FAIRBANKS, _Class Leader_. THOMAS AULD, _Class Leader_.

And yet, these were men who ferociously rushed in upon my Sabbath school, at St. Michael's, armed with mob-like missiles, and I must say, I thought him a Christian, until he took part in bloody by the lash. This same Garrison West was my class leader, and I must say, I thought him a Christian, until he took part in breaking up my school. He led me no more after that. The plea for this outrage was then, as it is now and at all times—the danger to good order. If the slaves learnt to read, they would learn something else, and something worse. The peace of slavery would be disturbed; slave rule would be endangered. I leave the reader to characterize a system which is endangered by such causes. I do not dispute the soundness of the reasoning. It is perfectly sound; and, if slavery be _right_, Sabbath schools for teaching slaves to read the bible are _wrong_, and ought to be put down. These Christian class leaders were, to this extent, consistent. They had settled the question, that slavery is _right_, and, by that standard, they determined that Sabbath schools are wrong. To be sure, they were Protestant, and held to the great Protestant right of every man to _"search the scriptures"_ for himself; but, then, to all general rules, there are _exceptions_. How convenient! What crimes may not be committed under the doctrine of the last remark. But, my dear, class leading Methodist brethren, did not condescend to give me a reason for breaking up the Sabbath school at St. Michael's; it was enough that they had determined upon its destruction. I am, however, digressing.

After getting the school cleverly into operation, the second time holding it in the woods, behind the barn, and in the shade of trees—I succeeded in inducing a free colored man, who lived several miles from our house, to permit me to hold my school in a room at his house. He, very kindly, gave me this liberty; but he incurred much peril in doing so, for the assemblage was an unlawful one. I shall not mention, here, the name of this man; for it might, even now, subject him to persecution, although the offenses were committed more than twenty years ago. I had, at one time, more than forty scholars, all of the right sort; and many of them succeeded in learning to read. I have met several slaves from Maryland, who were once my scholars; and who obtained their freedom, I doubt not, partly in consequence of the ideas imparted to them in that school. I have had various employments during my short life; but I look back to _none_ with more satisfaction, than to that afforded by my Sunday school. An attachment, deep and lasting, sprung up between me and my persecuted pupils, which made parting from them intensely grievous; and, when I think that most of these dear souls are yet shut up in this abject thralldom, I am overwhelmed with grief.

Besides my Sunday school, I devoted three evenings a week to my fellow slaves, during the winter. Let the reader reflect upon the fact, that, in this christian country, men and women are hiding from professors of religion, in barns, in the woods and fields, in order to learn to read the _holy bible_. Those dear souls, who came to my Sabbath school, came _not_ because it was popular or reputable to attend such a place, for they came under the liability of having forty stripes laid on their naked backs. Every moment they spend in my school, they were under this terrible liability; and, in this respect, I was sharer with them. Their minds had been cramped and starved by their cruel masters; the light of education had been completely excluded; and their hard earnings had been taken to educate their master's children. I felt a delight in circumventing the tyrants, and in blessing the victims of their curses.

The year at Mr. Freeland's passed off very smoothly, to outward seeming. Not a blow was given me during the whole year. To the credit of Mr. Freeland—irreligious though he was—it must be stated, that he was the best master I ever had, until I became my own master, and assumed for myself, as I had a right to do, the responsibility of my own existence and the exercise of my own powers.

For much of the happiness—or absence of misery—with which I passed this year with Mr. Freeland, I am indebted to the genial temper and ardent friendship of my brother slaves. They were, every one of them, manly, generous and brave, yes; I say they were brave, and I will add, fine looking. It is seldom the lot of mortals to have truer and better friends than were the slaves on this farm. It is not uncommon to charge slaves with great treachery toward each other, and to believe them incapable of confiding in each other; but I must say, that I never loved, esteemed, or confided in men, more than I did in these. They were as true as steel, and no band of brothers could have been more loving. There were no mean advantages taken of each other, as is sometimes the case where slaves are situated as we were; no tattling; no giving each other bad names to Mr. Freeland; and no elevating one at the expense of the other. We never undertook to do any thing, of any importance, which was likely to affect each other, without mutual consultation. We were generally a unit, and moved together. Thoughts and sentiments were exchanged between us, which might well be called very incendiary, by oppressors and tyrants; and perhaps the time has not even now come, when it is safe to unfold all the flying suggestions which arise in the minds of intelligent slaves. Several of my friends and brothers, if yet alive, are still in some part of the house of bondage; and though twenty years have passed away, the suspicious malice of slavery might punish them for even listening to my thoughts.

The slaveholder, kind or cruel, is a slaveholder still—the every hour violator of the just and inalienable rights of man; and he is, therefore, every hour silently whetting the knife of vengeance for his own throat. He never lisps a syllable in commendation of the fathers of this republic, nor denounces any attempted oppression of himself, without inviting the knife to his own throat, and asserting the rights of rebellion for his own slaves.

The year is ended, and we are now in the midst of the Christmas holidays, which are kept this year as last, according to the general description previously given.

CHAPTER XIX. _The Run-Away Plot_

NEW YEAR'S THOUGHTS AND MEDITATIONS—AGAIN BOUGHT BY FREELAND—NO AMBITION TO BE A SLAVE—KINDNESS NO COMPENSATION FOR SLAVERY—INCIPIENT STEPS TOWARD ESCAPE—CONSIDERATIONS LEADING THERETO—IRRECONCILABLE HOSTILITY TO SLAVERY—SOLEMN VOW TAKEN—PLAN DIVULGED TO THE SLAVES—_Columbian Orator—_SCHEME GAINS FAVOR, DESPITE PRO-SLAVERY PREACHING—DANGER OF DISCOVERY—SKILL OF SLAVEHOLDERS IN READING THE MINDS OF THEIR SLAVES—SUSPICION AND COERCION—HYMNS WITH DOUBLE MEANING—VALUE, IN DOLLARS, OF OUR COMPANY—PRELIMINARY CONSULTATION—PASS-WORD—CONFLICTS OF HOPE AND FEAR—DIFFICULTIES TO BE OVERCOME—IGNORANCE OF GEOGRAPHY—SURVEY OF IMAGINARY DIFFICULTIES—EFFECT ON OUR MINDS—PATRICK HENRY—SANDY BECOMES A DREAMER—ROUTE TO THE NORTH LAID OUT—OBJECTIONS CONSIDERED—FRAUDS PRACTICED ON FREEMEN—PASSES WRITTEN—ANXIETIES AS THE TIME DREW NEAR—DREAD OF FAILURE—APPEALS TO COMRADES—STRANGE PRESENTIMENT—COINCIDENCE—THE BETRAYAL DISCOVERED—THE MANNER OF ARRESTING US—RESISTANCE MADE BY HENRY HARRIS—ITS EFFECT—THE UNIQUE SPEECH OF MRS. FREELAND—OUR SAD PROCESSION TO PRISON—BRUTAL JEERS BY THE MULTITUDE ALONG THE ROAD—PASSES EATEN—THE DENIAL—SANDY TOO WELL LOVED TO BE SUSPECTED—DRAGGED BEHIND HORSES—THE JAIL A RELIEF—A NEW SET OF TORMENTORS—SLAVE-TRADERS—JOHN, CHARLES AND HENRY RELEASED—ALONE IN PRISON—I AM TAKEN OUT, AND SENT TO BALTIMORE.

I am now at the beginning of the year 1836, a time favorable for serious thoughts. The mind naturally occupies itself with the mysteries of life in all its phases—the ideal, the real and the actual. Sober people look both ways at the beginning of the year, surveying the errors of the past, and providing against possible errors of the future. I, too, was thus exercised. I had little pleasure in retrospect, and the prospect was not very brilliant. "Notwithstanding," thought I, "the many resolutions and prayers I have made, in behalf of freedom, I am, this first day of the year 1836, still a slave, still wandering in the depths of spirit-devouring thralldom. My faculties and powers of body and soul are not my own, but are the property of a fellow mortal, in no sense superior to me, except that he has the physical power to compel me to be owned and controlled by him. By the combined physical force of the community, I am his slave—a slave for life." With thoughts like these, I was perplexed and chafed; they rendered me gloomy and disconsolate. The anguish of my mind may not be written.

At the close of the year 1835, Mr. Freeland, my temporary master, had bought me of Capt. Thomas Auld, for the year 1836. His promptness in securing my services, would have been flattering to my vanity, had I been ambitious to win the reputation of being a

valuable slave. Even as it was, I felt a slight degree of complacency at the circumstance. It showed he was as well pleased with me as a slave, as I was with him as a master. I have already intimated my regard for Mr. Freeland, and I may say here, in addressing northern readers—where is no selfish motive for speaking in praise of a slaveholder—that Mr. Freeland was a man of many excellent qualities, and to me quite preferable to any master I ever had.

But the kindness of the slavemaster only gilds the chain of slavery, and detracts nothing from its weight or power. The thought that men are made for other and better uses than slavery, thrives best under the gentle treatment of a kind master. But the grim visage of slavery can assume no smiles which can fascinate the partially enlightened slave, into a forgetfulness of his bondage, nor of the desirableness of liberty.

I was not through the first month of this, my second year with the kind and gentlemanly Mr. Freeland, before I was earnestly considering and advising plans for gaining that freedom, which, when I was but a mere child, I had ascertained to be the natural and inborn right of every member of the human family. The desire for this freedom had been benumbed, while I was under the brutalizing dominion of Covey; and it had been postponed, and rendered inoperative, by my truly pleasant Sunday school engagements with my friends, during the year 1835, at Mr. Freeland's. It had, however, never entirely subsided. I hated slavery, always, and the desire for freedom only needed a favorable breeze, to fan it into a blaze, at any moment. The thought of only being a creature of the _present_ and the _past_, troubled me, and I longed to have a _future_—a future with hope in it. To be shut up entirely to the past and present, is abhorrent to the human mind; it is to the soul—whose life and happiness is unceasing progress—what the prison is to the body; a blight and mildew, a hell of horrors. The dawning of this, another year, awakened me from my temporary slumber, and roused into life my latent, but long cherished aspirations for freedom. I was now not only ashamed to be contented in slavery, but ashamed to _seem_ to be contented, and in my present favorable condition, under the mild rule of Mr. F., I am not sure that some kind reader will not condemn me for being over ambitious, and greatly wanting in proper humility, when I say the truth, that I now drove from me all thoughts of making the best of my lot, and welcomed only such thoughts as led me away from the house of bondage. The intense desires, now felt, _to be free_, quickened by my present favorable circumstances, brought me to the determination to act, as well as to think and speak. Accordingly, at the beginning of this year 1836, I took upon me a solemn vow, that the year which had now dawned upon me should not close, without witnessing an earnest attempt, on my part, to gain my liberty. This vow only bound me to make my escape individually; but the year spent with Mr. Freeland had attached me, as with "hooks of steel," to my brother slaves. The most affectionate and confiding friendship existed between us; and I felt it my duty to give them an opportunity to share in my virtuous determination by frankly disclosing to them my plans and purposes. Toward Henry and John Harris, I felt a friendship as strong as one man can feel for another; for I could have died with and for them. To them, therefore, with a suitable degree of caution, I began to disclose my sentiments and plans; sounding them, the while on the subject of running away, provided a good chance should offer. I scarcely need tell the reader, that I did my _very best_ to imbue the minds of my dear friends with my own views and feelings. Thoroughly awakened, now, and with a definite vow upon me, all my little reading, which had any bearing on the subject of human rights, was rendered available in my communications with my friends. That (to me) gem of a book, the _Columbian Orator_, with its eloquent orations and spicy dialogues, denouncing oppression and slavery—telling of what had been dared, done and suffered by men, to obtain the inestimable boon of liberty—was still fresh in my memory, and whirled into the ranks of my speech with the aptitude of well trained soldiers, going through the drill. The fact is, I here began my public speaking. I canvassed, with Henry and John, the subject of slavery, and dashed against it the condemning brand of God's eternal justice, which it every hour violates. My fellow servants were neither indifferent, dull, nor inapt. Our feelings were more alike than our opinions. All, however, were ready to act, when a feasible plan should be proposed. "Show us _how_ the thing is to be done," said they, "and all is clear."

We were all, except Sandy, quite free from slaveholding priestcraft. It was in vain that we had been taught from the pulpit at St. Michael's, the duty of obedience to our masters; to recognize God as the author of our enslavement; to regard running away an offense, alike against God and man; to deem our enslavement a merciful and beneficial arrangement; to esteem our condition, in this country, a paradise to that from which we had been snatched in Africa; to consider our hard hands and dark color as God's mark of displeasure, and as pointing us out as the proper subjects of slavery; that the relation of master and slave was one of reciprocal benefits; that our work was not more serviceable to our masters, than our master's thinking was serviceable to us. I say, it was in vain that the pulpit of St. Michael's had constantly inculcated these plausible doctrine. Nature laughed them to scorn. For my own part, I had now become altogether too big for my chains. Father Lawson's solemn words, of what I ought to be, and might be, in the providence of God, had not fallen dead on my soul. I was fast verging toward manhood, and the prophecies of my childhood were still unfulfilled. The thought, that year after year had passed away, and my resolutions to run away had failed and faded—that I was _still a slave_, and a slave, too, with chances for gaining my freedom diminished and still diminishing—was not a

matter to be slept over easily; nor did I easily sleep over it.

But here came a new trouble. Thoughts and purposes so incendiary as those I now cherished, could not agitate the mind long, without danger of making themselves manifest to scrutinizing and unfriendly beholders. I had reason to fear that my sable face might prove altogether too transparent for the safe concealment of my hazardous enterprise. Plans of greater moment have leaked through stone walls, and revealed their projectors. But, here was no stone wall to hide my purpose. I would have given my poor, tell tale face for the immoveable countenance of an Indian, for it was far from being proof against the daily, searching glances of those with whom I met.

It is the interest and business of slaveholders to study human nature, with a view to practical results, and many of them attain astonishing proficiency in discerning the thoughts and emotions of slaves. They have to deal not with earth, wood, or stone, but with _men;_ and, by every regard they have for their safety and prosperity, they must study to know the material on which they are at work. So much intellect as the slaveholder has around him, requires watching. Their safety depends upon their vigilance. Conscious of the injustice and wrong they are every hour perpetrating, and knowing what they themselves would do if made the victims of such wrongs, they are looking out for the first signs of the dread retribution of justice. They watch, therefore, with skilled and practiced eyes, and have learned to read, with great accuracy, the state of mind and heart of the slaves, through his sable face. These uneasy sinners are quick to inquire into the matter, where the slave is concerned. Unusual sobriety, apparent abstraction, sullenness and indifference—indeed, any mood out of the common way—afford ground for suspicion and inquiry. Often relying on their superior position and wisdom, they hector and torture the slave into a confession, by affecting to know the truth of their accusations. “You have got the devil in you,” say they, “and we will whip him out of you.” I have often been put thus to the torture, on bare suspicion. This system has its disadvantages as well as their opposite. The slave is sometimes whipped into the confession of offenses which he never committed. The reader will see that the good old rule—“a man is to be held innocent until proved to be guilty”—does not hold good on the slave plantation. Suspicion and torture are the approved methods of getting at the truth, here. It was necessary for me, therefore, to keep a watch over my deportment, lest the enemy should get the better of me.

But with all our caution and studied reserve, I am not sure that Mr. Freeland did not suspect that all was not right with us. It _did_ seem that he watched us more narrowly, after the plan of escape had been conceived and discussed amongst us. Men seldom see themselves as others see them; and while, to ourselves, everything connected with our contemplated escape appeared concealed, Mr. Freeland may have, with the peculiar prescience of a slaveholder, mastered the huge thought which was disturbing our peace in slavery.

I am the more inclined to think that he suspected us, because, prudent as we were, as I now look back, I can see that we did many silly things, very well calculated to awaken suspicion. We were, at times, remarkably buoyant, singing hymns and making joyous exclamations, almost as triumphant in their tone as if we reached a land of freedom and safety. A keen observer might have detected in our repeated singing of

O Canaan, sweet Canaan, I am bound for the land of Canaan,

something more than a hope of reaching heaven. We meant to reach the _north_—and the north was our Canaan.

I thought I heard them say, There were lions in the way, I don’t expect to Star Much longer here.

Run to Jesus—shun the danger— I don’t expect to stay Much longer here.

was a favorite air, and had a double meaning. In the lips of some, it meant the expectation of a speedy summons to a world of spirits; but, in the lips of _our_ company, it simply meant, a speedy pilgrimage toward a free state, and deliverance from all the evils and dangers of slavery.

I had succeeded in winning to my (what slaveholders would call wicked) scheme, a company of five young men, the very flower of the neighborhood, each one of whom would have commanded one thousand dollars in the home market. At New Orleans, they would have brought fifteen hundred dollars a piece, and, perhaps, more. The names of our party were as follows: Henry Harris; John Harris, brother to Henry; Sandy Jenkins, of root memory; Charles Roberts, and Henry Bailey. I was the youngest, but one, of the party. I had, however, the advantage of them all, in experience, and in a knowledge of letters. This gave me great influence over them. Perhaps not one of them, left to himself, would have dreamed of escape as a possible thing. Not one of them was self-moved in the matter. They all wanted to be free; but the serious thought of running away, had not entered into their minds, until I won them

to the undertaking. They all were tolerably well off—for slaves—and had dim hopes of being set free, some day, by their masters. If any one is to blame for disturbing the quiet of the slaves and slave-masters of the neighborhood of St. Michael's, _I am the man_. I claim to be the instigator of the high crime (as the slaveholders regard it) and I kept life in it, until life could be kept in it no longer.

Pending the time of our contemplated departure out of our Egypt, we met often by night, and on every Sunday. At these meetings we talked the matter over; told our hopes and fears, and the difficulties discovered or imagined; and, like men of sense, we counted the cost of the enterprise to which we were committing ourselves.

These meetings must have resembled, on a small scale, the meetings of revolutionary conspirators, in their primary condition. We were plotting against our (so called) lawful rulers; with this difference that we sought our own good, and not the harm of our enemies. We did not seek to overthrow them, but to escape from them. As for Mr. Freeland, we all liked him, and would have gladly remained with him, _as freeman_. LIBERTY was our aim; and we had now come to think that we had a right to liberty, against every obstacle even against the lives of our enslavers.

We had several words, expressive of things, important to us, which we understood, but which, even if distinctly heard by an outsider, would convey no certain meaning. I have reasons for suppressing these _pass-words_, which the reader will easily divine. I hated the secrecy; but where slavery is powerful, and liberty is weak, the latter is driven to concealment or to destruction.

The prospect was not always a bright one. At times, we were almost tempted to abandon the enterprise, and to get back to that comparative peace of mind, which even a man under the gallows might feel, when all hope of escape had vanished. Quiet bondage was felt to be better than the doubts, fears and uncertainties, which now so sadly perplexed and disturbed us.

The infirmities of humanity, generally, were represented in our little band. We were confident, bold and determined, at times; and, again, doubting, timid and wavering; whistling, like the boy in the graveyard, to keep away the spirits.

To look at the map, and observe the proximity of Eastern Shore, Maryland, to Delaware and Pennsylvania, it may seem to the reader quite absurd, to regard the proposed escape as a formidable undertaking. But to _understand_, some one has said a man must _stand under_. The real distance was great enough, but the imagined distance was, to our ignorance, even greater. Every slaveholder seeks to impress his slave with a belief in the boundlessness of slave territory, and of his own almost illimitable power. We all had vague and indistinct notions of the geography of the country.

The distance, however, is not the chief trouble. The nearer are the lines of a slave state and the borders of a free one, the greater the peril. Hired kidnappers infest these borders. Then, too, we knew that merely reaching a free state did not free us; that, wherever caught, we could be returned to slavery. We could see no spot on this side the ocean, where we could be free. We had heard of Canada, the real Canaan of the American bondmen, simply as a country to which the wild goose and the swan repaired at the end of winter, to escape the heat of summer, but not as the home of man. I knew something of theology, but nothing of geography. I really did not, at that time, know that there was a state of New York, or a state of Massachusetts. I had heard of Pennsylvania, Delaware and New Jersey, and all the southern states, but was ignorant of the free states, generally. New York city was our northern limit, and to go there, and be forever harassed with the liability of being hunted down and returned to slavery—with the certainty of being treated ten times worse than we had ever been treated before was a prospect far from delightful, and it might well cause some hesitation about engaging in the enterprise. The case, sometimes, to our excited visions, stood thus: At every gate through which we had to pass, we saw a watchman; at every ferry, a guard; on every bridge, a sentinel; and in every wood, a patrol or slave-hunter. We were hemmed in on every side. The good to be sought, and the evil to be shunned, were flung in the balance, and weighed against each other. On the one hand, there stood slavery; a stern reality, glaring frightfully upon us, with the blood of millions in his polluted skirts—terrible to behold—greedily devouring our hard earnings and feeding himself upon our flesh. Here was the evil from which to escape. On the other hand, far away, back in the hazy distance, where all forms seemed but shadows, under the flickering light of the north star—behind some craggy hill or snow-covered mountain—stood a doubtful freedom, half frozen, beckoning us to her icy domain. This was the good to be sought. The inequality was as great as that between certainty and uncertainty. This, in itself, was enough to stagger us; but when we came to survey the untrodden road, and conjecture the many possible difficulties, we were appalled, and at times, as I have said, were upon the point of giving over the struggle altogether.

The reader can have little idea of the phantoms of trouble which flit, in such circumstances, before the uneducated mind of the slave. Upon either side, we saw grim death assuming a variety of horrid shapes. Now, it was starvation, causing us, in a strange and friendless land, to eat our own flesh. Now, we were contending with the waves (for our journey was in part by water) and were drowned. Now, we were hunted by dogs, and overtaken and torn to pieces by their merciless fangs. We were stung by

scorpions—chased by wild beasts—bitten by snakes; and, worst of all, after having succeeded in swimming rivers—encountering wild beasts—sleeping in the woods—suffering hunger, cold, heat and nakedness—we supposed ourselves to be overtaken by hired kidnappers, who, in the name of the law, and for their thrice accursed reward, would, perchance, fire upon us—kill some, wound others, and capture all. This dark picture, drawn by ignorance and fear, at times greatly shook our determination, and not unfrequently caused us to

Rather bear those ills we had Than fly to others which we knew not of.

I am not disposed to magnify this circumstance in my experience, and yet I think I shall seem to be so disposed, to the reader. No man can tell the intense agony which is felt by the slave, when wavering on the point of making his escape. All that he has is at stake; and even that which he has not, is at stake, also. The life which he has, may be lost, and the liberty which he seeks, may not be gained.

Patrick Henry, to a listening senate, thrilled by his magic eloquence, and ready to stand by him in his boldest flights, could say, GIVE ME LIBERTY OR GIVE ME DEATH, and this saying was a sublime one, even for a freeman; but, incomparably more sublime, is the same sentiment, when _practically_ asserted by men accustomed to the lash and chain—men whose sensibilities must have become more or less deadened by their bondage. With us it was a _doubtful_ liberty, at best, that we sought; and a certain, lingering death in the rice swamps and sugar fields, if we failed. Life is not lightly regarded by men of sane minds. It is precious, alike to the pauper and to the prince—to the slave, and to his master; and yet, I believe there was not one among us, who would not rather have been shot down, than pass away life in hopeless bondage.

In the progress of our preparations, Sandy, the root man, became troubled. He began to have dreams, and some of them were very distressing. One of these, which happened on a Friday night, was, to him, of great significance; and I am quite ready to confess, that I felt somewhat damped by it myself. He said, “I dreamed, last night, that I was roused from sleep, by strange noises, like the voices of a swarm of angry birds, that caused a roar as they passed, which fell upon my ear like a coming gale over the tops of the trees. Looking up to see what it could mean,” said Sandy, “I saw you, Frederick, in the claws of a huge bird, surrounded by a large number of birds, of all colors and sizes. These were all picking at you, while you, with your arms, seemed to be trying to protect your eyes. Passing over me, the birds flew in a south-westerly direction, and I watched them until they were clean out of sight. Now, I saw this as plainly as I now see you; and furder, honey, watch de Friday night dream; dare is sumpon in it, shose you born; dare is, indeed, honey.”

I confess I did not like this dream; but I threw off concern about it, by attributing it to the general excitement and perturbation consequent upon our contemplated plan of escape. I could not, however, shake off its effect at once. I felt that it boded me no good. Sandy was unusually emphatic and oracular, and his manner had much to do with the impression made upon me.

The plan of escape which I recommended, and to which my comrades assented, was to take a large canoe, owned by Mr. Hamilton, and, on the Saturday night previous to the Easter holidays, launch out into the Chesapeake bay, and paddle for its head—a distance of seventy miles with all our might. Our course, on reaching this point, was, to turn the canoe adrift, and bend our steps toward the north star, till we reached a free state.

There were several objections to this plan. One was, the danger from gales on the bay. In rough weather, the waters of the Chesapeake are much agitated, and there is danger, in a canoe, of being swamped by the waves. Another objection was, that the canoe would soon be missed; the absent persons would, at once, be suspected of having taken it; and we should be pursued by some of the fast sailing bay craft out of St. Michael’s. Then, again, if we reached the head of the bay, and turned the canoe adrift, she might prove a guide to our track, and bring the land hunters after us.

These and other objections were set aside, by the stronger ones which could be urged against every other plan that could then be suggested. On the water, we had a chance of being regarded as fishermen, in the service of a master. On the other hand, by taking the land route, through the counties adjoining Delaware, we should be subjected to all manner of interruptions, and many very disagreeable questions, which might give us serious trouble. Any white man is authorized to stop a man of color, on any road, and examine him, and arrest him, if he so desires.

By this arrangement, many abuses (considered such even by slaveholders) occur. Cases have been known, where freemen have been called upon to show their free papers, by a pack of ruffians—and, on the presentation of the papers, the ruffians have torn them up, and seized their victim, and sold him to a life of endless bondage.

The week before our intended start, I wrote a pass for each of our party, giving them permission to visit Baltimore, during the Easter holidays. The pass ran after this manner:

This is to certify, that I, the undersigned, have given the bearer, my servant, John, full liberty to go to Baltimore, to spend the Easter holidays.

W.H. Near St. Michael's, Talbot county, Maryland

Although we were not going to Baltimore, and were intending to land east of North Point, in the direction where I had seen the Philadelphia steamers go, these passes might be made useful to us in the lower part of the bay, while steering toward Baltimore. These were not, however, to be shown by us, until all other answers failed to satisfy the inquirer. We were all fully alive to the importance of being calm and self-possessed, when accosted, if accosted we should be; and we more times than one rehearsed to each other how we should behave in the hour of trial.

These were long, tedious days and nights. The suspense was painful, in the extreme. To balance probabilities, where life and liberty hang on the result, requires steady nerves. I panted for action, and was glad when the day, at the close of which we were to start, dawned upon us. Sleeping, the night before, was out of the question. I probably felt more deeply than any of my companions, because I was the instigator of the movement. The responsibility of the whole enterprise rested on my shoulders. The glory of success, and the shame and confusion of failure, could not be matters of indifference to me. Our food was prepared; our clothes were packed up; we were all ready to go, and impatient for Saturday morning—considering that the last morning of our bondage.

I cannot describe the tempest and tumult of my brain, that morning. The reader will please to bear in mind, that, in a slave state, an unsuccessful runaway is not only subjected to cruel torture, and sold away to the far south, but he is frequently execrated by the other slaves. He is charged with making the condition of the other slaves intolerable, by laying them all under the suspicion of their masters—subjecting them to greater vigilance, and imposing greater limitations on their privileges. I dreaded murmurs from this quarter. It is difficult, too, for a slavemaster to believe that slaves escaping have not been aided in their flight by some one of their fellow slaves. When, therefore, a slave is missing, every slave on the place is closely examined as to his knowledge of the undertaking; and they are sometimes even tortured, to make them disclose what they are suspected of knowing of such escape.

Our anxiety grew more and more intense, as the time of our intended departure for the north drew nigh. It was truly felt to be a matter of life and death with us; and we fully intended to _fight_ as well as _run_, if necessity should occur for that extremity. But the trial hour was not yet to come. It was easy to resolve, but not so easy to act. I expected there might be some drawing back, at the last. It was natural that there should be; therefore, during the intervening time, I lost no opportunity to explain away difficulties, to remove doubts, to dispel fears, and to inspire all with firmness. It was too late to look back; and _now_ was the time to go forward. Like most other men, we had done the talking part of our work, long and well; and the time had come to _act_ as if we were in earnest, and meant to be as true in action as in words. I did not forget to appeal to the pride of my comrades, by telling them that, if after having solemnly promised to go, as they had done, they now failed to make the attempt, they would, in effect, brand themselves with cowardice, and might as well sit down, fold their arms, and acknowledge themselves as fit only to be _slaves_. This detestable character, all were unwilling to assume. Every man except Sandy (he, much to our regret, withdrew) stood firm; and at our last meeting we pledged ourselves afresh, and in the most solemn manner, that, at the time appointed, we _would_ certainly start on our long journey for a free country. This meeting was in the middle of the week, at the end of which we were to start.

Early that morning we went, as usual, to the field, but with hearts that beat quickly and anxiously. Any one intimately acquainted with us, might have seen that all was not well with us, and that some monster lingered in our thoughts. Our work that morning was the same as it had been for several days past—drawing out and spreading manure. While thus engaged, I had a sudden presentiment, which flashed upon me like lightning in a dark night, revealing to the lonely traveler the gulf before, and the enemy behind. I instantly turned to Sandy Jenkins, who was near me, and said to him, _"Sandy, we are betrayed;_ something has just told me so." I felt as sure of it, as if the officers were there in sight. Sandy said, "Man, dat is strange; but I feel just as you do." If my mother—then long in her grave—had appeared before me, and told me that we were betrayed, I could not, at that moment, have felt more certain of the fact.

In a few minutes after this, the long, low and distant notes of the horn summoned us from the field to breakfast. I felt as one may be supposed to feel before being led forth to be executed for some great offense. I wanted no breakfast; but I went with the other

slaves toward the house, for form's sake. My feelings were not disturbed as to the right of running away; on that point I had no trouble, whatever. My anxiety arose from a sense of the consequences of failure.

In thirty minutes after that vivid presentiment came the apprehended crash. On reaching the house, for breakfast, and glancing my eye toward the lane gate, the worst was at once made known. The lane gate off Mr. Freeland's house, is nearly a half mile from the door, and shaded by the heavy wood which bordered the main road. I was, however, able to descry four white men, and two colored men, approaching. The white men were on horseback, and the colored men were walking behind, and seemed to be tied. _"It is all over with us,"_ thought I, _"we are surely betrayed_." I now became composed, or at least comparatively so, and calmly awaited the result. I watched the ill-omened company, till I saw them enter the gate. Successful flight was impossible, and I made up my mind to stand, and meet the evil, whatever it might be; for I was not without a slight hope that things might turn differently from what I at first expected. In a few moments, in came Mr. William Hamilton, riding very rapidly, and evidently much excited. He was in the habit of riding very slowly, and was seldom known to gallop his horse. This time, his horse was nearly at full speed, causing the dust to roll thick behind him. Mr. Hamilton, though one of the most resolute men in the whole neighborhood, was, nevertheless, a remarkably mild spoken man; and, even when greatly excited, his language was cool and circumspect. He came to the door, and inquired if Mr. Freeland was in. I told him that Mr. Freeland was at the barn. Off the old gentleman rode, toward the barn, with unwonted speed. Mary, the cook, was at a loss to know what was the matter, and I did not profess any skill in making her understand. I knew she would have united, as readily as any one, in cursing me for bringing trouble into the family; so I held my peace, leaving matters to develop themselves, without my assistance. In a few moments, Mr. Hamilton and Mr. Freeland came down from the barn to the house; and, just as they made their appearance in the front yard, three men (who proved to be constables) came dashing into the lane, on horseback, as if summoned by a sign requiring quick work. A few seconds brought them into the front yard, where they hastily dismounted, and tied their horses. This done, they joined Mr. Freeland and Mr. Hamilton, who were standing a short distance from the kitchen. A few moments were spent, as if in consulting how to proceed, and then the whole party walked up to the kitchen door. There was now no one in the kitchen but myself and John Harris. Henry and Sandy were yet at the barn. Mr. Freeland came inside the kitchen door, and with an agitated voice, called me by name, and told me to come forward; that there was some gentlemen who wished to see me. I stepped toward them, at the door, and asked what they wanted, when the constables grabbed me, and told me that I had better not resist; that I had been in a scrape, or was said to have been in one; that they were merely going to take me where I could be examined; that they were going to carry me to St. Michael's, to have me brought before my master. They further said, that, in case the evidence against me was not true, I should be acquitted. I was now firmly tied, and completely at the mercy of my captors. Resistance was idle. They were five in number, armed to the very teeth. When they had secured me, they next turned to John Harris, and, in a few moments, succeeded in tying him as firmly as they had already tied me. They next turned toward Henry Harris, who had now returned from the barn. "Cross your hands," said the constables, to Henry. "I won't" said Henry, in a voice so firm and clear, and in a manner so determined, as for a moment to arrest all proceedings. "Won't you cross your hands?" said Tom Graham, the constable. "_No I won't_," said Henry, with increasing emphasis. Mr. Hamilton, Mr. Freeland, and the officers, now came near to Henry. Two of the constables drew out their shining pistols, and swore by the name of God, that he should cross his hands, or they would shoot him down. Each of these hired ruffians now cocked their pistols, and, with fingers apparently on the triggers, presented their deadly weapons to the breast of the unarmed slave, saying, at the same time, if he did not cross his hands, they would "blow his d—d heart out of him."

"Shoot! shoot me!" said Henry. "_You can't kill me but once_. Shoot!—shoot! and be d—d. _I won't be tied_." This, the brave fellow said in a voice as defiant and heroic in its tone, as was the language itself; and, at the moment of saying this, with the pistols at his very breast, he quickly raised his arms, and dashed them from the puny hands of his assassins, the weapons flying in opposite directions. Now came the struggle. All hands was now rushed upon the brave fellow, and, after beating him for some time, they succeeded in overpowering and tying him. Henry put me to shame; he fought, and fought bravely. John and I had made no resistance. The fact is, I never see much use in fighting, unless there is a reasonable probability of whipping somebody. Yet there was something almost providential in the resistance made by the gallant Henry. But for that resistance, every soul of us would have been hurried off to the far south. Just a moment previous to the trouble with Henry, Mr. Hamilton _mildly_ said—and this gave me the unmistakable clue to the cause of our arrest—"Perhaps we had now better make a search for those protections, which we understand Frederick has written for himself and the rest." Had these passes been found, they would have been point blank proof against us, and would have confirmed all the statements of our betrayer. Thanks to the resistance of Henry, the excitement produced by the scuffle drew all attention in that direction, and I succeeded in flinging my pass, unobserved, into the fire. The confusion attendant upon the scuffle, and the apprehension of further trouble, perhaps, led our captors to forego, for the present, any search for _"those protections" which Frederick was said to have written for his companions_; so we were not yet convicted of

the purpose to run away; and it was evident that there was some doubt, on the part of all, whether we had been guilty of such a purpose.

Just as we were all completely tied, and about ready to start toward St. Michael's, and thence to jail, Mrs. Betsey Freeland (mother to William, who was very much attached—after the southern fashion—to Henry and John, they having been reared from childhood in her house) came to the kitchen door, with her hands full of biscuits—for we had not had time to take our breakfast that morning—and divided them between Henry and John. This done, the lady made the following parting address to me, looking and pointing her bony finger at me. "You devil! you yellow devil! It was you that put it into the heads of Henry and John to run away. But for _you_, you _long legged yellow devil_, Henry and John would never have thought of running away." I gave the lady a look, which called forth a scream of mingled wrath and terror, as she slammed the kitchen door, and went in, leaving me, with the rest, in hands as harsh as her own broken voice.

Could the kind reader have been quietly riding along the main road to or from Easton, that morning, his eye would have met a painful sight. He would have seen five young men, guilty of no crime, save that of preferring _liberty_ to a life of _bondage_, drawn along the public highway—firmly bound together—tramping through dust and heat, bare-footed and bare-headed—fastened to three strong horses, whose riders were armed to the teeth, with pistols and daggers—on their way to prison, like felons, and suffering every possible insult from the crowds of idle, vulgar people, who clustered around, and heartlessly made their failure the occasion for all manner of ribaldry and sport. As I looked upon this crowd of vile persons, and saw myself and friends thus assailed and persecuted, I could not help seeing the fulfillment of Sandy's dream. I was in the hands of moral vultures, and firmly held in their sharp talons, and was hurried away toward Easton, in a south-easterly direction, amid the jeers of new birds of the same feather, through every neighborhood we passed. It seemed to me (and this shows the good understanding between the slaveholders and their allies) that every body we met knew the cause of our arrest, and were out, awaiting our passing by, to feast their vindictive eyes on our misery and to gloat over our ruin. Some said, _I ought to be hanged_, and others, _I ought to be burnt_, others, I ought to have the _"hide"_ taken from my back; while no one gave us a kind word or sympathizing look, except the poor slaves, who were lifting their heavy hoes, and who cautiously glanced at us through the post-and-rail fences, behind which they were at work. Our sufferings, that morning, can be more easily imagined than described. Our hopes were all blasted, at a blow. The cruel injustice, the victorious crime, and the helplessness of innocence, led me to ask, in my ignorance and weakness "Where now is the God of justice and mercy? And why have these wicked men the power thus to trample upon our rights, and to insult our feelings?" And yet, in the next moment, came the consoling thought, _"The day of oppressor will come at last."_ Of one thing I could be glad—not one of my dear friends, upon whom I had brought this great calamity, either by word or look, reproached me for having led them into it. We were a band of brothers, and never dearer to each other than now. The thought which gave us the most pain, was the probable separation which would now take place, in case we were sold off to the far south, as we were likely to be. While the constables were looking forward, Henry and I, being fastened together, could occasionally exchange a word, without being observed by the kidnappers who had us in charge. "What shall I do with my pass?" said Henry. "Eat it with your biscuit," said I; "it won't do to tear it up." We were now near St. Michael's. The direction concerning the passes was passed around, and executed. _"Own nothing!"_ said I. _"Own nothing!"_ was passed around and enjoined, and assented to. Our confidence in each other was unshaken; and we were quite resolved to succeed or fail together—as much after the calamity which had befallen us, as before.

On reaching St. Michael's, we underwent a sort of examination at my master's store, and it was evident to my mind, that Master Thomas suspected the truthfulness of the evidence upon which they had acted in arresting us; and that he only affected, to some extent, the positiveness with which he asserted our guilt. There was nothing said by any of our company, which could, in any manner, prejudice our cause; and there was hope, yet, that we should be able to return to our homes—if for nothing else, at least to find out the guilty man or woman who had betrayed us.

To this end, we all denied that we had been guilty of intended flight. Master Thomas said that the evidence he had of our intention to run away, was strong enough to hang us, in a case of murder. "But," said I, "the cases are not equal. If murder were committed, some one must have committed it—the thing is done! In our case, nothing has been done! We have not run away. Where is the evidence against us? We were quietly at our work." I talked thus, with unusual freedom, to bring out the evidence against us, for we all wanted, above all things, to know the guilty wretch who had betrayed us, that we might have something tangible upon which to pour the execrations. From something which dropped, in the course of the talk, it appeared that there was but one witness against us—and that that witness could not be produced. Master Thomas would not tell us _who_ his informant was; but we suspected, and suspected _one_ person _only_. Several circumstances seemed to point SANDY out, as our betrayer. His entire knowledge of our plans his participation in them—his withdrawal from us—his dream, and his simultaneous presentiment that we were

betrayed—the taking us, and the leaving him—were calculated to turn suspicion toward him; and yet, we could not suspect him. We all loved him too well to think it _possible_ that he could have betrayed us. So we rolled the guilt on other shoulders.

We were literally dragged, that morning, behind horses, a distance of fifteen miles, and placed in the Easton jail. We were glad to reach the end of our journey, for our pathway had been the scene of insult and mortification. Such is the power of public opinion, that it is hard, even for the innocent, to feel the happy consolations of innocence, when they fall under the maledictions of this power. How could we regard ourselves as in the right, when all about us denounced us as criminals, and had the power and the disposition to treat us as such.

In jail, we were placed under the care of Mr. Joseph Graham, the sheriff of the county. Henry, and John, and myself, were placed in one room, and Henry Baily and Charles Roberts, in another, by themselves. This separation was intended to deprive us of the advantage of concert, and to prevent trouble in jail.

Once shut up, a new set of tormentors came upon us. A swarm of imps, in human shape the slave-traders, deputy slave-traders, and agents of slave-traders—that gather in every country town of the state, watching for chances to buy human flesh (as buzzards to eat carrion) flocked in upon us, to ascertain if our masters had placed us in jail to be sold. Such a set of debased and villainous creatures, I never saw before, and hope never to see again. I felt myself surrounded as by a pack of _fiends_, fresh from _perdition_. They laughed, leered, and grinned at us; saying, “Ah! boys, we’ve got you, havn’t we? So you were about to make your escape? Where were you going to?” After taunting us, and peering at us, as long as they liked, they one by one subjected us to an examination, with a view to ascertain our value; feeling our arms and legs, and shaking us by the shoulders to see if we were sound and healthy; impudently asking us, “how we would like to have them for masters?” To such questions, we were, very much to their annoyance, quite dumb, disdaining to answer them. For one, I detested the whisky-bloated gamblers in human flesh; and I believe I was as much detested by them in turn. One fellow told me, “if he had me, he would cut the devil out of me pretty quick.”

These Negro buyers are very offensive to the genteel southern Christian public. They are looked upon, in respectable Maryland society, as necessary, but detestable characters. As a class, they are hardened ruffians, made such by nature and by occupation. Their ears are made quite familiar with the agonizing cry of outraged and woe-smitted humanity. Their eyes are forever open to human misery. They walk amid desecrated affections, insulted virtue, and blasted hopes. They have grown intimate with vice and blood; they gloat over the wildest illustrations of their soul-damning and earth-polluting business, and are moral pests. Yes; they are a legitimate fruit of slavery; and it is a puzzle to make out a case of greater villainy for them, than for the slaveholders, who make such a class _possible_. They are mere hucksters of the surplus slave produce of Maryland and Virginia coarse, cruel, and swaggering bullies, whose very breathing is of blasphemy and blood.

Aside from these slave-buyers, who infested the prison, from time to time, our quarters were much more comfortable than we had any right to expect they would be. Our allowance of food was small and coarse, but our room was the best in the jail—neat and spacious, and with nothing about it necessarily reminding us of being in prison, but its heavy locks and bolts and the black, iron lattice-work at the windows. We were prisoners of state, compared with most slaves who are put into that Easton jail. But the place was not one of contentment. Bolts, bars and grated windows are not acceptable to freedom-loving people of any color. The suspense, too, was painful. Every step on the stairway was listened to, in the hope that the comer would cast a ray of light on our fate. We would have given the hair off our heads for half a dozen words with one of the waiters in Sol. Lowe’s hotel. Such waiters were in the way of hearing, at the table, the probable course of things. We could see them flitting about in their white jackets in front of this hotel, but could speak to none of them.

Soon after the holidays were over, contrary to all our expectations, Messrs. Hamilton and Freeland came up to Easton; not to make a bargain with the “Georgia traders,” nor to send us up to Austin Woldfolk, as is usual in the case of run-away slaves, but to release Charles, Henry Harris, Henry Baily and John Harris, from prison, and this, too, without the infliction of a single blow. I was now left entirely alone in prison. The innocent had been taken, and the guilty left. My friends were separated from me, and apparently forever. This circumstance caused me more pain than any other incident connected with our capture and imprisonment. Thirty-nine lashes on my naked and bleeding back, would have been joyfully borne, in preference to this separation from these, the friends of my youth. And yet, I could not but feel that I was the victim of something like justice. Why should these young men, who were led into this scheme by me, suffer as much as the instigator? I felt glad that they were leased from prison, and from the dread prospect of a life (or death I should rather say) in the rice swamps. It is due to the noble Henry, to say, that he seemed almost as reluctant to leave the prison with me in it, as he was to be tied and dragged to prison. But he and the rest knew that we should, in all the likelihoods of the case, be separated, in the event of being sold; and since we were now completely in the hands of our owners, we

all concluded it would be best to go peaceably home.

Not until this last separation, dear reader, had I touched those profounder depths of desolation, which it is the lot of slaves often to reach. I was solitary in the world, and alone within the walls of a stone prison, left to a fate of life-long misery. I had hoped and expected much, for months before, but my hopes and expectations were now withered and blasted. The ever dreaded slave life in Georgia, Louisiana and Alabama—from which escape is next to impossible now, in my loneliness, stared me in the face. The possibility of ever becoming anything but an abject slave, a mere machine in the hands of an owner, had now fled, and it seemed to me it had fled forever. A life of living death, beset with the innumerable horrors of the cotton field, and the sugar plantation, seemed to be my doom. The fiends, who rushed into the prison when we were first put there, continued to visit me, and to ply me with questions and with their tantalizing remarks. I was insulted, but helpless; keenly alive to the demands of justice and liberty, but with no means of asserting them. To talk to those imps about justice and mercy, would have been as absurd as to reason with bears and tigers. Lead and steel are the only arguments that they understand.

After remaining in this life of misery and despair about a week, which, by the way, seemed a month, Master Thomas, very much to my surprise, and greatly to my relief, came to the prison, and took me out, for the purpose, as he said, of sending me to Alabama, with a friend of his, who would emancipate me at the end of eight years. I was glad enough to get out of prison; but I had no faith in the story that this friend of Capt. Auld would emancipate me, at the end of the time indicated. Besides, I never had heard of his having a friend in Alabama, and I took the announcement, simply as an easy and comfortable method of shipping me off to the far south. There was a little scandal, too, connected with the idea of one Christian selling another to the Georgia traders, while it was deemed every way proper for them to sell to others. I thought this friend in Alabama was an invention, to meet this difficulty, for Master Thomas was quite jealous of his Christian reputation, however unconcerned he might be about his real Christian character. In these remarks, however, it is possible that I do Master Thomas Auld injustice. He certainly did not exhaust his power upon me, in the case, but acted, upon the whole, very generously, considering the nature of my offense. He had the power and the provocation to send me, without reserve, into the very everglades of Florida, beyond the remotest hope of emancipation; and his refusal to exercise that power, must be set down to his credit.

After lingering about St. Michael's a few days, and no friend from Alabama making his appearance, to take me there, Master Thomas decided to send me back again to Baltimore, to live with his brother Hugh, with whom he was now at peace; possibly he became so by his profession of religion, at the camp-meeting in the Bay Side. Master Thomas told me that he wished me to go to Baltimore, and learn a trade; and that, if I behaved myself properly, he would _emancipate me at twenty-five!_ Thanks for this one beam of hope in the future. The promise had but one fault; it seemed too good to be true.

CHAPTER XX. _Apprenticeship Life_

NOTHING LOST BY THE ATTEMPT TO RUN AWAY—COMRADES IN THEIR OLD HOMES—REASONS FOR SENDING ME AWAY—RETURN TO BALTIMORE—CONTRAST BETWEEN TOMMY AND THAT OF HIS COLORED COMPANION—TRIALS IN GARDINER'S SHIP YARD—DESPERATE FIGHT—ITS CAUSES—CONFLICT BETWEEN WHITE AND BLACK LABOR—DESCRIPTION OF THE OUTRAGE—COLORED TESTIMONY NOTHING—CONDUCT OF MASTER HUGH—SPIRIT OF SLAVERY IN BALTIMORE—MY CONDITION IMPROVES—NEW ASSOCIATIONS—SLAVEHOLDER'S RIGHT TO TAKE HIS WAGES—HOW TO MAKE A CONTENTED SLAVE.

Well! dear reader, I am not, as you may have already inferred, a loser by the general upstir, described in the foregoing chapter. The little domestic revolution, notwithstanding the sudden snub it got by the treachery of somebody—I dare not say or think who—did not, after all, end so disastrously, as when in the iron cage at Easton, I conceived it would. The prospect, from that point, did look about as dark as any that ever cast its gloom over the vision of the anxious, out-looking, human spirit. "All is well that ends well." My affectionate comrades, Henry and John Harris, are still with Mr. William Freeland. Charles Roberts and Henry Baily are safe at their homes. I have not, therefore, any thing to regret on their account. Their masters have mercifully forgiven them, probably on the ground suggested in the spirited little speech of Mrs. Freeland, made to me just before leaving for the jail—namely: that they had been allured into the wicked scheme of making their escape, by me; and that, but for me, they would never have dreamed of a thing so shocking! My friends had nothing to regret, either; for while they were watched more closely on account of what had happened, they were, doubtless, treated more kindly than before, and got new assurances that they would be legally emancipated, some day, provided their behavior should make them deserving, from that time forward. Not a blow, as I learned, was struck any one of them. As for Master William Freeland, good, unsuspecting soul, he did not believe that we were intending to run away at all. Having

given—as he thought—no occasion to his boys to leave him, he could not think it probable that they had entertained a design so grievous. This, however, was not the view taken of the matter by “Mas’ Billy,” as we used to call the soft spoken, but crafty and resolute Mr. William Hamilton. He had no doubt that the crime had been meditated; and regarding me as the instigator of it, he frankly told Master Thomas that he must remove me from that neighborhood, or he would shoot me down. He would not have one so dangerous as “Frederick” tampering with his slaves. William Hamilton was not a man whose threat might be safely disregarded. I have no doubt that he would have proved as good as his word, had the warning given not been promptly taken. He was furious at the thought of such a piece of high-handed _theft_, as we were about to perpetrate the stealing of our own bodies and souls! The feasibility of the plan, too, could the first steps have been taken, was marvelously plain. Besides, this was a _new_ idea, this use of the bay. Slaves escaping, until now, had taken to the woods; they had never dreamed of profaning and abusing the waters of the noble Chesapeake, by making them the highway from slavery to freedom. Here was a broad road of destruction to slavery, which, before, had been looked upon as a wall of security by slaveholders. But Master Billy could not get Mr. Freeland to see matters precisely as he did; nor could he get Master Thomas so excited as he was himself. The latter—I must say it to his credit—showed much humane feeling in his part of the transaction, and atoned for much that had been harsh, cruel and unreasonable in his former treatment of me and others. His clemency was quite unusual and unlooked for. “Cousin Tom” told me that while I was in jail, Master Thomas was very unhappy; and that the night before his going up to release me, he had walked the floor nearly all night, evincing great distress; that very tempting offers had been made to him, by the Negro-traders, but he had rejected them all, saying that _money could not tempt him to sell me to the far south_. All this I can easily believe, for he seemed quite reluctant to send me away, at all. He told me that he only consented to do so, because of the very strong prejudice against me in the neighborhood, and that he feared for my safety if I remained there.

Thus, after three years spent in the country, roughing it in the field, and experiencing all sorts of hardships, I was again permitted to return to Baltimore, the very place, of all others, short of a free state, where I most desired to live. The three years spent in the country, had made some difference in me, and in the household of Master Hugh. “Little Tommy” was no longer _little_ Tommy; and I was not the slender lad who had left for the Eastern Shore just three years before. The loving relations between me and Mas’ Tommy were broken up. He was no longer dependent on me for protection, but felt himself a _man_, with other and more suitable associates. In childhood, he scarcely considered me inferior to himself certainly, as good as any other boy with whom he played; but the time had come when his _friend_ must become his _slave_. So we were cold, and we parted. It was a sad thing to me, that, loving each other as we had done, we must now take different roads. To him, a thousand avenues were open. Education had made him acquainted with all the treasures of the world, and liberty had flung open the gates thereunto; but I, who had attended him seven years, and had watched over him with the care of a big brother, fighting his battles in the street, and shielding him from harm, to an extent which had induced his mother to say, “Oh! Tommy is always safe, when he is with Freddy,” must be confined to a single condition. He could grow, and become a MAN; I could grow, though I could _not_ become a man, but must remain, all my life, a minor—a mere boy. Thomas Auld, Junior, obtained a situation on board the brig “Tweed,” and went to sea. I know not what has become of him; he certainly has my good wishes for his welfare and prosperity. There were few persons to whom I was more sincerely attached than to him, and there are few in the world I would be more pleased to meet.

Very soon after I went to Baltimore to live, Master Hugh succeeded in getting me hired to Mr. William Gardiner, an extensive ship builder on Fell’s Point. I was placed here to learn to calk, a trade of which I already had some knowledge, gained while in Mr. Hugh Auld’s ship-yard, when he was a master builder. Gardiner’s, however, proved a very unfavorable place for the accomplishment of that object. Mr. Gardiner was, that season, engaged in building two large man-of-war vessels, professedly for the Mexican government. These vessels were to be launched in the month of July, of that year, and, in failure thereof, Mr. G. would forfeit a very considerable sum of money. So, when I entered the ship-yard, all was hurry and driving. There were in the yard about one hundred men; of these about seventy or eighty were regular carpenters—privileged men. Speaking of my condition here I wrote, years ago—and I have now no reason to vary the picture as follows:

There was no time to learn any thing. Every man had to do that which he knew how to do. In entering the ship-yard, my orders from Mr. Gardiner were, to do whatever the carpenters commanded me to do. This was placing me at the beck and call of about seventy-five men. I was to regard all these as masters. Their word was to be my law. My situation was a most trying one. At times I needed a dozen pair of hands. I was called a dozen ways in the space of a single minute. Three or four voices would strike my ear at the same moment. It was—“Fred., come help me to cant this timber here.” “Fred., come carry this timber yonder.”—“Fred., bring that roller here.”—“Fred., go get a fresh can of water.”—“Fred., come help saw off the end of this timber.”—“Fred., go quick and get the crow bar.”—“Fred., hold on the end of this fall.”—“Fred., go to the blacksmith’s shop, and get a new punch.”—

“Hurra, Fred.! run and bring me a cold chisel.”—“I say, Fred., bear a hand, and get up a fire as quick as lightning under that steam-box.”—“Halloo, nigger! come, turn this grindstone.”—“Come, come! move, move! and _bowse_ this timber forward.”—“I say, darkey, blast your eyes, why don’t you heat up some pitch?”—“Halloo! halloo! halloo!” (Three voices at the same time.) “Come here!—Go there!—Hold on where you are! D—n you, if you move, I’ll knock your brains out!”

Such, dear reader, is a glance at the school which was mine, during, the first eight months of my stay at Baltimore. At the end of the eight months, Master Hugh refused longer to allow me to remain with Mr. Gardiner. The circumstance which led to his taking me away, was a brutal outrage, committed upon me by the white apprentices of the ship-yard. The fight was a desperate one, and I came out of it most shockingly mangled. I was cut and bruised in sundry places, and my left eye was nearly knocked out of its socket. The facts, leading to this barbarous outrage upon me, illustrate a phase of slavery destined to become an important element in the overthrow of the slave system, and I may, therefore state them with some minuteness. That phase is this: _the conflict of slavery with the interests of the white mechanics and laborers of the south_. In the country, this conflict is not so apparent; but, in cities, such as Baltimore, Richmond, New Orleans, Mobile, &c., it is seen pretty clearly. The slaveholders, with a craftiness peculiar to themselves, by encouraging the enmity of the poor, laboring white man against the blacks, succeeds in making the said white man almost as much a slave as the black slave himself. The difference between the white slave, and the black slave, is this: the latter belongs to _one_ slaveholder, and the former belongs to _all_ the slaveholders, collectively. The white slave has taken from him, by indirection, what the black slave has taken from him, directly, and without ceremony. Both are plundered, and by the same plunderers. The slave is robbed, by his master, of all his earnings, above what is required for his bare physical necessities; and the white man is robbed by the slave system, of the just results of his labor, because he is flung into competition with a class of laborers who work without wages. The competition, and its injurious consequences, will, one day, array the nonslaveholding white people of the slave states, against the slave system, and make them the most effective workers against the great evil. At present, the slaveholders blind them to this competition, by keeping alive their prejudice against the slaves, _as men_—not against them _as slaves_. They appeal to their pride, often denouncing emancipation, as tending to place the white man, on an equality with Negroes, and, by this means, they succeed in drawing off the minds of the poor whites from the real fact, that, by the rich slave-master, they are already regarded as but a single remove from equality with the slave. The impression is cunningly made, that slavery is the only power that can prevent the laboring white man from falling to the level of the slave’s poverty and degradation. To make this enmity deep and broad, between the slave and the poor white man, the latter is allowed to abuse and whip the former, without hinderance. But—as I have suggested—this state of facts prevails _mostly_ in the country. In the city of Baltimore, there are not unfrequent murmurs, that educating the slaves to be mechanics may, in the end, give slavemasters power to dispense with the services of the poor white man altogether. But, with characteristic dread of offending the slaveholders, these poor, white mechanics in Mr. Gardiner’s ship-yard—instead of applying the natural, honest remedy for the apprehended evil, and objecting at once to work there by the side of slaves—made a cowardly attack upon the free colored mechanics, saying _they_ were eating the bread which should be eaten by American freemen, and swearing that they would not work with them. The feeling was, _really_, against having their labor brought into competition with that of the colored people at all; but it was too much to strike directly at the interest of the slaveholders; and, therefore proving their servility and cowardice they dealt their blows on the poor, colored freeman, and aimed to prevent _him_ from serving himself, in the evening of life, with the trade with which he had served his master, during the more vigorous portion of his days. Had they succeeded in driving the black freemen out of the ship-yard, they would have determined also upon the removal of the black slaves. The feeling was very bitter toward all colored people in Baltimore, about this time (1836), and they—free and slave suffered all manner of insult and wrong.

Until a very little before I went there, white and black ship carpenters worked side by side, in the ship yards of Mr. Gardiner, Mr. Duncan, Mr. Walter Price, and Mr. Robb. Nobody seemed to see any impropriety in it. To outward seeming, all hands were well satisfied. Some of the blacks were first rate workmen, and were given jobs requiring highest skill. All at once, however, the white carpenters knocked off, and swore that they would no longer work on the same stage with free Negroes. Taking advantage of the heavy contract resting upon Mr. Gardiner, to have the war vessels for Mexico ready to launch in July, and of the difficulty of getting other hands at that season of the year, they swore they would not strike another blow for him, unless he would discharge his free colored workmen.

Now, although this movement did not extend to me, _in form_, it did reach me, _in fact_. The spirit which it awakened was one of malice and bitterness, toward colored people _generally_, and I suffered with the rest, and suffered severely. My fellow apprentices very soon began to feel it to be degrading to work with me. They began to put on high looks, and to talk contemptuously and maliciously of _“the Niggers;”_ saying, that “they would take the country,” that “they ought to be killed.” Encouraged by the cowardly workmen, who, knowing me to be a slave, made no issue with Mr. Gardiner about my being there, these young men did their

utmost to make it impossible for me to stay. They seldom called me to do any thing, without coupling the call with a curse, and Edward North, the biggest in every thing, rascality included, ventured to strike me, whereupon I picked him up, and threw him into the dock. Whenever any of them struck me, I struck back again, regardless of consequences. I could manage any of them _singly_, and, while I could keep them from combining, I succeeded very well. In the conflict which ended my stay at Mr. Gardiner's, I was beset by four of them at once—Ned North, Ned Hays, Bill Stewart, and Tom Humphreys. Two of them were as large as myself, and they came near killing me, in broad day light. The attack was made suddenly, and simultaneously. One came in front, armed with a brick; there was one at each side, and one behind, and they closed up around me. I was struck on all sides; and, while I was attending to those in front, I received a blow on my head, from behind, dealt with a heavy hand-spike. I was completely stunned by the blow, and fell, heavily, on the ground, among the timbers. Taking advantage of my fall, they rushed upon me, and began to pound me with their fists. I let them lay on, for a while, after I came to myself, with a view of gaining strength. They did me little damage, so far; but, finally, getting tired of that sport, I gave a sudden surge, and, despite their weight, I rose to my hands and knees. Just as I did this, one of their number (I know not which) planted a blow with his boot in my left eye, which, for a time, seemed to have burst my eyeball. When they saw my eye completely closed, my face covered with blood, and I staggering under the stunning blows they had given me, they left me. As soon as I gathered sufficient strength, I picked up the hand-spike, and, madly enough, attempted to pursue them; but here the carpenters interfered, and compelled me to give up my frenzied pursuit. It was impossible to stand against so many.

Dear reader, you can hardly believe the statement, but it is true, and, therefore, I write it down: not fewer than fifty white men stood by, and saw this brutal and shameless outrage committed, and not a man of them all interposed a single word of mercy. There were four against one, and that one's face was beaten and battered most horribly, and no one said, "that is enough;" but some cried out, "Kill him—kill him—kill the d—d nigger! knock his brains out—he struck a white person." I mention this inhuman outcry, to show the character of the men, and the spirit of the times, at Gardiner's ship yard, and, indeed, in Baltimore generally, in 1836. As I look back to this period, I am almost amazed that I was not murdered outright, in that ship yard, so murderous was the spirit which prevailed there. On two occasions, while there, I came near losing my life. I was driving bolts in the hold, through the keelson, with Hays. In its course, the bolt bent. Hays cursed me, and said that it was my blow which bent the bolt. I denied this, and charged it upon him. In a fit of rage he seized an adze, and darted toward me. I met him with a maul, and parried his blow, or I should have then lost my life. A son of old Tom Lanman (the latter's double murder I have elsewhere charged upon him), in the spirit of his miserable father, made an assault upon me, but the blow with his maul missed me. After the united assault of North, Stewart, Hays and Humphreys, finding that the carpenters were as bitter toward me as the apprentices, and that the latter were probably set on by the former, I found my only chances for life was in flight. I succeeded in getting away, without an additional blow. To strike a white man, was death, by Lynch law, in Gardiner's ship yard; nor was there much of any other law toward colored people, at that time, in any other part of Maryland. The whole sentiment of Baltimore was murderous.

After making my escape from the ship yard, I went straight home, and related the story of the outrage to Master Hugh Auld; and it is due to him to say, that his conduct—though he was not a religious man—was every way more humane than that of his brother, Thomas, when I went to the latter in a somewhat similar plight, from the hands of _"Brother Edward Covey."_ He listened attentively to my narration of the circumstances leading to the ruffianly outrage, and gave many proofs of his strong indignation at what was done. Hugh was a rough, but manly-hearted fellow, and, at this time, his best nature showed itself.

The heart of my once almost over-kind mistress, Sophia, was again melted in pity toward me. My puffed-out eye, and my scarred and blood-covered face, moved the dear lady to tears. She kindly drew a chair by me, and with friendly, consoling words, she took water, and washed the blood from my face. No mother's hand could have been more tender than hers. She bound up my head, and covered my wounded eye with a lean piece of fresh beef. It was almost compensation for the murderous assault, and my suffering, that it furnished and occasion for the manifestation, once more, of the orignally(sic) characteristic kindness of my mistress. Her affectionate heart was not yet dead, though much hardened by time and by circumstances.

As for Master Hugh's part, as I have said, he was furious about it; and he gave expression to his fury in the usual forms of speech in that locality. He poured curses on the heads of the whole ship yard company, and swore that he would have satisfaction for the outrage. His indignation was really strong and healthy; but, unfortunately, it resulted from the thought that his rights of property, in my person, had not been respected, more than from any sense of the outrage committed on me _as a man_. I inferred as much as this, from the fact that he could, himself, beat and mangle when it suited him to do so. Bent on having satisfaction, as he said, just as soon as I got a little the better of my bruises, Master Hugh took me to Esquire Watson's office, on Bond street, Fell's Point, with a view to procuring the arrest of those who had assaulted me. He related the outrage to the magistrate, as I had related it to him,

and seemed to expect that a warrant would, at once, be issued for the arrest of the lawless ruffians.

Mr. Watson heard it all, and instead of drawing up his warrant, he inquired.—

“Mr. Auld, who saw this assault of which you speak?”

“It was done, sir, in the presence of a ship yard full of hands.”

“Sir,” said Watson, “I am sorry, but I cannot move in this matter except upon the oath of white witnesses.”

“But here’s the boy; look at his head and face,” said the excited Master Hugh; _“they_ show _what_ has been done.”

But Watson insisted that he was not authorized to do anything, unless _white_ witnesses of the transaction would come forward, and testify to what had taken place. He could issue no warrant on my word, against white persons; and, if I had been killed in the presence of a _thousand blacks_, their testimony, combined would have been insufficient to arrest a single murderer. Master Hugh, for once, was compelled to say, that this state of things was _too bad;_ and he left the office of the magistrate, disgusted.

Of course, it was impossible to get any white man to testify against my assailants. The carpenters saw what was done; but the actors were but the agents of their malice, and only what the carpenters sanctioned. They had cried, with one accord, _“Kill the nigger!” “Kill the nigger!”_ Even those who may have pitied me, if any such were among them, lacked the moral courage to come and volunteer their evidence. The slightest manifestation of sympathy or justice toward a person of color, was denounced as abolitionism; and the name of abolitionist, subjected its bearer to frightful liabilities. “D—n _abolitionists,”_ and _“Kill the niggers,”_ were the watch-words of the foul-mouthed ruffians of those days. Nothing was done, and probably there would not have been any thing done, had I been killed in the affray. The laws and the morals of the Christian city of Baltimore, afforded no protection to the sable denizens of that city.

Master Hugh, on finding he could get no redress for the cruel wrong, withdrew me from the employment of Mr. Gardiner, and took me into his own family, Mrs. Auld kindly taking care of me, and dressing my wounds, until they were healed, and I was ready to go again to work.

While I was on the Eastern Shore, Master Hugh had met with reverses, which overthrew his business; and he had given up ship building in his own yard, on the City Block, and was now acting as foreman of Mr. Walter Price. The best he could now do for me, was to take me into Mr. Price’s yard, and afford me the facilities there, for completing the trade which I had began to learn at Gardiner’s. Here I rapidly became expert in the use of my calking tools; and, in the course of a single year, I was able to command the highest wages paid to journeymen calkers in Baltimore.

The reader will observe that I was now of some pecuniary value to my master. During the busy season, I was bringing six and seven dollars per week. I have, sometimes, brought him as much as nine dollars a week, for the wages were a dollar and a half per day.

After learning to calk, I sought my own employment, made my own contracts, and collected my own earnings; giving Master Hugh no trouble in any part of the transactions to which I was a party.

Here, then, were better days for the Eastern Shore _slave_. I was now free from the vexatious assalts(sic) of the apprentices at Mr. Gardiner’s; and free from the perils of plantation life, and once more in a favorable condition to increase my little stock of education, which had been at a dead stand since my removal from Baltimore. I had, on the Eastern Shore, been only a teacher, when in company with other slaves, but now there were colored persons who could instruct me. Many of the young calkers could read, write and cipher. Some of them had high notions about mental improvement; and the free ones, on Fell’s Point, organized what they called the _“East Baltimore Mental Improvement Society.”_ To this society, notwithstanding it was intended that only free persons should attach themselves, I was admitted, and was, several times, assigned a prominent part in its debates. I owe much to the society of these young men.

The reader already knows enough of the _ill_ effects of good treatment on a slave, to anticipate what was now the case in my improved condition. It was not long before I began to show signs of disquiet with slavery, and to look around for means to get out of that condition by the shortest route. I was living among _free men;_ and was, in all respects, equal to them by nature and by attainments. _Why should I be a slave?_ There was _no_ reason why I should be the thrall of any man.

Besides, I was now getting—as I have said—a dollar and fifty cents per day. I contracted for it, worked for it, earned it, collected it; it was paid to me, and it was _rightfully_ my own; and yet, upon every returning Saturday night, this money—my own hard earnings, every cent of it—was demanded of me, and taken from me by Master Hugh. He did not earn it; he had no hand in earning it; why, then, should he have it? I owed him nothing. He had given me no schooling, and I had received from him only my food and raiment; and for these, my services were supposed to pay, from the first. The right to take my earnings, was the right of the robber. He had the power to compel me to give him the fruits of my labor, and this power was his only right in the case. I became more and more dissatisfied with this state of things; and, in so becoming, I only gave proof of the same human nature which every reader of this chapter in my life—slaveholder, or nonslaveholder—is conscious of possessing.

To make a contented slave, you must make a thoughtless one. It is necessary to darken his moral and mental vision, and, as far as possible, to annihilate his power of reason. He must be able to detect no inconsistencies in slavery. The man that takes his earnings, must be able to convince him that he has a perfect right to do so. It must not depend upon mere force; the slave must know no Higher Law than his master's will. The whole relationship must not only demonstrate, to his mind, its necessity, but its absolute rightfulness. If there be one crevice through which a single drop can fall, it will certainly rust off the slave's chain.

CHAPTER XXI. _My Escape from Slavery_

CLOSING INCIDENTS OF "MY LIFE AS A SLAVE"—REASONS WHY FULL PARTICULARS OF THE MANNER OF MY ESCAPE WILL NOT BE GIVEN—CRAFTINESS AND MALICE OF SLAVEHOLDERS—SUSPICION OF AIDING A SLAVE'S ESCAPE ABOUT AS DANGEROUS AS POSITIVE EVIDENCE—WANT OF WISDOM SHOWN IN PUBLISHING DETAILS OF THE ESCAPE OF THE FUGITIVES—PUBLISHED ACCOUNTS REACH THE MASTERS, NOT THE SLAVES—SLAVEHOLDERS STIMULATED TO GREATER WATCHFULNESS—MY CONDITION—DISCONTENT—SUSPICIONS IMPLIED BY MASTER HUGH'S MANNER, WHEN RECEIVING MY WAGES—HIS OCCASIONAL GENEROSITY!—DIFFICULTIES IN THE WAY OF ESCAPE—EVERY AVENUE GUARDED—PLAN TO OBTAIN MONEY—I AM ALLOWED TO HIRE MY TIME—A GLEAM OF HOPE—ATTENDS CAMP-MEETING, WITHOUT PERMISSION—ANGER OF MASTER HUGH THEREAT—THE RESULT—MY PLANS OF ESCAPE ACCELERATED THERBY—THE DAY FOR MY DEPARTURE FIXED—HARASSED BY DOUBTS AND FEARS—PAINFUL THOUGHTS OF SEPARATION FROM FRIENDS—THE ATTEMPT MADE—ITS SUCCESS.

I will now make the kind reader acquainted with the closing incidents of my "Life as a Slave," having already trenched upon the limit allotted to my "Life as a Freeman." Before, however, proceeding with this narration, it is, perhaps, proper that I should frankly state, in advance, my intention to withhold a part of the(sic) connected with my escape from slavery. There are reasons for this suppression, which I trust the reader will deem altogether valid. It may be easily conceived, that a full and complete statement of all facts pertaining to the flight of a bondman, might implicate and embarrass some who may have, wittingly or unwittingly, assisted him; and no one can wish me to involve any man or woman who has befriended me, even in the liability of embarrassment or trouble.

Keen is the scent of the slaveholder; like the fangs of the rattlesnake, his malice retains its poison long; and, although it is now nearly seventeen years since I made my escape, it is well to be careful, in dealing with the circumstances relating to it. Were I to give but a shadowy outline of the process adopted, with characteristic aptitude, the crafty and malicious among the slaveholders might, possibly, hit upon the track I pursued, and involve some one in suspicion which, in a slave state, is about as bad as positive evidence. The colored man, there, must not only shun evil, but shun the very _appearance_ of evil, or be condemned as a criminal. A slaveholding community has a peculiar taste for ferreting out offenses against the slave system, justice there being more sensitive in its regard for the peculiar rights of this system, than for any other interest or institution. By stringing together a train of events and circumstances, even if I were not very explicit, the means of escape might be ascertained, and, possibly, those means be rendered, thereafter, no longer available to the liberty-seeking children of bondage I have left behind me. No antislavery man can wish me to do anything favoring such results, and no slaveholding reader has any right to expect the impartment of such information.

While, therefore, it would afford me pleasure, and perhaps would materially add to the interest of my story, were I at liberty to gratify a curiosity which I know to exist in the minds of many, as to the manner of my escape, I must deprive myself of this pleasure, and the curious of the gratification, which such a statement of facts would afford. I would allow myself to suffer under the greatest imputations that evil minded men might suggest, rather than exculpate myself by explanation, and thereby run the hazards of closing the slightest avenue by which a brother in suffering might clear himself of the chains and fetters of slavery.

The practice of publishing every new invention by which a slave is known to have escaped from slavery, has neither wisdom nor necessity to sustain it. Had not Henry Box Brown and his friends attracted slaveholding attention to the manner of his escape, we might have had a thousand _Box Browns_ per annum. The singularly original plan adopted by William and Ellen Crafts, perished with the first using, because every slaveholder in the land was apprised of it. The _salt water slave_ who hung in the guards of a steamer, being washed three days and three nights—like another Jonah—by the waves of the sea, has, by the publicity given to the circumstance, set a spy on the guards of every steamer departing from southern ports.

I have never approved of the very public manner, in which some of our western friends have conducted what _they_ call the _"Under-ground Railroad,"_ but which, I think, by their open declarations, has been made, most emphatically, the _"Upper_-ground Railroad." Its stations are far better known to the slaveholders than to the slaves. I honor those good men and women for their noble daring, in willingly subjecting themselves to persecution, by openly avowing their participation in the escape of slaves; nevertheless, the good resulting from such avowals, is of a very questionable character. It may kindle an enthusiasm, very pleasant to inhale; but that is of no practical benefit to themselves, nor to the slaves escaping. Nothing is more evident, than that such disclosures are a positive evil to the slaves remaining, and seeking to escape. In publishing such accounts, the anti-slavery man addresses the slaveholder, _not the slave;_ he stimulates the former to greater watchfulness, and adds to his facilities for capturing his slave. We owe something to the slaves, south of Mason and Dixon's line, as well as to those north of it; and, in discharging the duty of aiding the latter, on their way to freedom, we should be careful to do nothing which would be likely to hinder the former, in making their escape from slavery. Such is my detestation of slavery, that I would keep the merciless slaveholder profoundly ignorant of the means of flight adopted by the slave. He should be left to imagine himself surrounded by myriads of invisible tormentors, ever ready to snatch, from his infernal grasp, his trembling prey. In pursuing his victim, let him be left to feel his way in the dark; let shades of darkness, commensurate with his crime, shut every ray of light from his pathway; and let him be made to feel, that, at every step he takes, with the hellish purpose of reducing a brother man to slavery, he is running the frightful risk of having his hot brains dashed out by an invisible hand.

But, enough of this. I will now proceed to the statement of those facts, connected with my escape, for which I am alone responsible, and for which no one can be made to suffer but myself.

My condition in the year (1838) of my escape, was, comparatively, a free and easy one, so far, at least, as the wants of the physical man were concerned; but the reader will bear in mind, that my troubles from the beginning, have been less physical than mental, and he will thus be prepared to find, after what is narrated in the previous chapters, that slave life was adding nothing to its charms for me, as I grew older, and became better acquainted with it. The practice, from week to week, of openly robbing me of all my earnings, kept the nature and character of slavery constantly before me. I could be robbed by _indirection_, but this was _too_ open and barefaced to be endured. I could see no reason why I should, at the end of each week, pour the reward of my honest toil into the purse of any man. The thought itself vexed me, and the manner in which Master Hugh received my wages, vexed me more than the original wrong. Carefully counting the money and rolling it out, dollar by dollar, he would look me in the face, as if he would search my heart as well as my pocket, and reproachfully ask me, "_Is that all_?"—implying that I had, perhaps, kept back part of my wages; or, if not so, the demand was made, possibly, to make me feel, that, after all, I was an "unprofitable servant." Draining me of the last cent of my hard earnings, he would, however, occasionally—when I brought home an extra large sum—dole out to me a sixpence or a shilling, with a view, perhaps, of kindling up my gratitude; but this practice had the opposite effect—it was an admission of _my right to the whole sum_. The fact, that he gave me any part of my wages, was proof that he suspected that I had a right _to the whole of them_. I always felt uncomfortable, after having received anything in this way, for I feared that the giving me a few cents, might, possibly, ease his conscience, and make him feel himself a pretty honorable robber, after all!

Held to a strict account, and kept under a close watch—the old suspicion of my running away not having been entirely removed—escape from slavery, even in Baltimore, was very difficult. The railroad from Baltimore to Philadelphia was under regulations so stringent, that even _free_ colored travelers were almost excluded. They must have _free_ papers; they must be measured and carefully examined, before they were allowed to enter the cars; they only went in the day time, even when so examined. The steamboats were under regulations equally stringent. All the great turnpikes, leading northward, were beset with kidnappers, a class of men who watched the newspapers for advertisements for runaway slaves, making their living by the accursed reward of slave hunting.

My discontent grew upon me, and I was on the look-out for means of escape. With money, I could easily have managed the matter, and, therefore, I hit upon the plan of soliciting the privilege of hiring my time. It is quite common, in Baltimore, to allow slaves this privilege, and it is the practice, also, in New Orleans. A slave who is considered trustworthy, can, by paying his master a definite

sum regularly, at the end of each week, dispose of his time as he likes. It so happened that I was not in very good odor, and I was far from being a trustworthy slave. Nevertheless, I watched my opportunity when Master Thomas came to Baltimore (for I was still his property, Hugh only acted as his agent) in the spring of 1838, to purchase his spring supply of goods, and applied to him, directly, for the much-coveted privilege of hiring my time. This request Master Thomas unhesitatingly refused to grant; and he charged me, with some sternness, with inventing this stratagem to make my escape. He told me, “I could go _nowhere_ but he could catch me; and, in the event of my running away, I might be assured he should spare no pains in his efforts to recapture me.” He recounted, with a good deal of eloquence, the many kind offices he had done me, and exhorted me to be contented and obedient. “Lay out no plans for the future,” said he. “If you behave yourself properly, I will take care of you.” Now, kind and considerate as this offer was, it failed to soothe me into repose. In spite of Master Thomas, and, I may say, in spite of myself, also, I continued to think, and worse still, to think almost exclusively about the injustice and wickedness of slavery. No effort of mine or of his could silence this trouble-giving thought, or change my purpose to run away.

About two months after applying to Master Thomas for the privilege of hiring my time, I applied to Master Hugh for the same liberty, supposing him to be unacquainted with the fact that I had made a similar application to Master Thomas, and had been refused. My boldness in making this request, fairly astounded him at the first. He gazed at me in amazement. But I had many good reasons for pressing the matter; and, after listening to them awhile, he did not absolutely refuse, but told me he would think of it. Here, then, was a gleam of hope. Once master of my own time, I felt sure that I could make, over and above my obligation to him, a dollar or two every week. Some slaves have made enough, in this way, to purchase their freedom. It is a sharp spur to industry; and some of the most enterprising colored men in Baltimore hire themselves in this way. After mature reflection—as I must suppose it was Master Hugh granted me the privilege in question, on the following terms: I was to be allowed all my time; to make all bargains for work; to find my own employment, and to collect my own wages; and, in return for this liberty, I was required, or obliged, to pay him three dollars at the end of each week, and to board and clothe myself, and buy my own calking tools. A failure in any of these particulars would put an end to my privilege. This was a hard bargain. The wear and tear of clothing, the losing and breaking of tools, and the expense of board, made it necessary for me to earn at least six dollars per week, to keep even with the world. All who are acquainted with calking, know how uncertain and irregular that employment is. It can be done to advantage only in dry weather, for it is useless to put wet oakum into a seam. Rain or shine, however, work or no work, at the end of each week the money must be forthcoming.

Master Hugh seemed to be very much pleased, for a time, with this arrangement; and well he might be, for it was decidedly in his favor. It relieved him of all anxiety concerning me. His money was sure. He had armed my love of liberty with a lash and a driver, far more efficient than any I had before known; and, while he derived all the benefits of slaveholding by the arrangement, without its evils, I endured all the evils of being a slave, and yet suffered all the care and anxiety of a responsible freeman. “Nevertheless,” thought I, “it is a valuable privilege another step in my career toward freedom.” It was something even to be permitted to stagger under the disadvantages of liberty, and I was determined to hold on to the newly gained footing, by all proper industry. I was ready to work by night as well as by day; and being in the enjoyment of excellent health, I was able not only to meet my current expenses, but also to lay by a small sum at the end of each week. All went on thus, from the month of May till August; then—for reasons which will become apparent as I proceed—my much valued liberty was wrested from me.

During the week previous to this (to me) calamitous event, I had made arrangements with a few young friends, to accompany them, on Saturday night, to a camp-meeting, held about twelve miles from Baltimore. On the evening of our intended start for the camp-ground, something occurred in the ship yard where I was at work, which detained me unusually late, and compelled me either to disappoint my young friends, or to neglect carrying my weekly dues to Master Hugh. Knowing that I had the money, and could hand it to him on another day, I decided to go to camp-meeting, and to pay him the three dollars, for the past week, on my return. Once on the camp-ground, I was induced to remain one day longer than I had intended, when I left home. But, as soon as I returned, I went straight to his house on Fell street, to hand him his (my) money. Unhappily, the fatal mistake had been committed. I found him exceedingly angry. He exhibited all the signs of apprehension and wrath, which a slaveholder may be surmised to exhibit on the supposed escape of a favorite slave. “You rascal! I have a great mind to give you a severe whipping. How dare you go out of the city without first asking and obtaining my permission?” “Sir,” said I, “I hired my time and paid you the price you asked for it. I did not know that it was any part of the bargain that I should ask you when or where I should go.”

“You did not know, you rascal! You are bound to show yourself here every Saturday night.” After reflecting, a few moments, he became somewhat cooled down; but, evidently greatly troubled, he said, “Now, you scoundrel! you have done for yourself; you shall hire your time no longer. The next thing I shall hear of, will be your running away. Bring home your tools and your clothes, at

once. I'll teach you how to go off in this way."

Thus ended my partial freedom. I could hire my time no longer; and I obeyed my master's orders at once. The little taste of liberty which I had had—although as the reader will have seen, it was far from being unalloyed—by no means enhanced my contentment with slavery. Punished thus by Master Hugh, it was now my turn to punish him. "Since," thought I, "you _will_ make a slave of me, I will await your orders in all things;" and, instead of going to look for work on Monday morning, as I had formerly done, I remained at home during the entire week, without the performance of a single stroke of work. Saturday night came, and he called upon me, as usual, for my wages. I, of course, told him I had done no work, and had no wages. Here we were at the point of coming to blows. His wrath had been accumulating during the whole week; for he evidently saw that I was making no effort to get work, but was most aggravatingly awaiting his orders, in all things. As I look back to this behavior of mine, I scarcely know what possessed me, thus to trifle with those who had such unlimited power to bless or to blast me. Master Hugh raved and swore his determination to _"get hold of me;"_ but, wisely for _him_, and happily for _me_, his wrath only employed those very harmless, impalpable missiles, which roll from a limber tongue. In my desperation, I had fully made up my mind to measure strength with Master Hugh, in case he should undertake to execute his threats. I am glad there was no necessity for this; for resistance to him could not have ended so happily for me, as it did in the case of Covey. He was not a man to be safely resisted by a slave; and I freely own, that in my conduct toward him, in this instance, there was more folly than wisdom. Master Hugh closed his reproofs, by telling me that, hereafter, I need give myself no uneasiness about getting work; that he "would, himself, see to getting work for me, and enough of it, at that." This threat I confess had some terror in it; and, on thinking the matter over, during the Sunday, I resolved, not only to save him the trouble of getting me work, but that, upon the third day of September, I would attempt to make my escape from slavery. The refusal to allow me to hire my time, therefore, hastened the period of flight. I had three weeks, now, in which to prepare for my journey.

Once resolved, I felt a certain degree of repose, and on Monday, instead of waiting for Master Hugh to seek employment for me, I was up by break of day, and off to the ship yard of Mr. Butler, on the City Block, near the draw-bridge. I was a favorite with Mr. B., and, young as I was, I had served as his foreman on the float stage, at calking. Of course, I easily obtained work, and, at the end of the week—which by the way was exceedingly fine I brought Master Hugh nearly nine dollars. The effect of this mark of returning good sense, on my part, was excellent. He was very much pleased; he took the money, commended me, and told me I might have done the same thing the week before. It is a blessed thing that the tyrant may not always know the thoughts and purposes of his victim. Master Hugh little knew what my plans were. The going to camp-meeting without asking his permission—the insolent answers made to his reproaches—the sulky deportment the week after being deprived of the privilege of hiring my time—had awakened in him the suspicion that I might be cherishing disloyal purposes. My object, therefore, in working steadily, was to remove suspicion, and in this I succeeded admirably. He probably thought I was never better satisfied with my condition, than at the very time I was planning my escape. The second week passed, and again I carried him my full week's wages—_nine dollars;_ and so well pleased was he, that he gave me TWENTY-FIVE CENTS! and "bade me make good use of it!" I told him I would, for one of the uses to which I meant to put it, was to pay my fare on the underground railroad.

Things without went on as usual; but I was passing through the same internal excitement and anxiety which I had experienced two years and a half before. The failure, in that instance, was not calculated to increase my confidence in the success of this, my second attempt; and I knew that a second failure could not leave me where my first did—I must either get to the _far north_, or be sent to the _far south_. Besides the exercise of mind from this state of facts, I had the painful sensation of being about to separate from a circle of honest and warm hearted friends, in Baltimore. The thought of such a separation, where the hope of ever meeting again is excluded, and where there can be no correspondence, is very painful. It is my opinion, that thousands would escape from slavery who now remain there, but for the strong cords of affection that bind them to their families, relatives and friends. The daughter is hindered from escaping, by the love she bears her mother, and the father, by the love he bears his children; and so, to the end of the chapter. I had no relations in Baltimore, and I saw no probability of ever living in the neighborhood of sisters and brothers; but the thought of leaving my friends, was among the strongest obstacles to my running away. The last two days of the week—Friday and Saturday—were spent mostly in collecting my things together, for my journey. Having worked four days that week, for my master, I handed him six dollars, on Saturday night. I seldom spent my Sundays at home; and, for fear that something might be discovered in my conduct, I kept up my custom, and absented myself all day. On Monday, the third day of September, 1838, in accordance with my resolution, I bade farewell to the city of Baltimore, and to that slavery which had been my abhorrence from childhood.

How I got away—in what direction I traveled—whether by land or by water; whether with or without assistance—must, for reasons already mentioned, remain unexplained.

LIFE as a FREEMAN

CHAPTER XXII. _Liberty Attained_

TRANSITION FROM SLAVERY TO FREEDOM—A WANDERER IN NEW YORK—FEELINGS ON REACHING THAT CITY—AN OLD ACQUAINTANCE MET—UNFAVORABLE IMPRESSIONS—LONELINESS AND INSECURITY—APOLOGY FOR SLAVES WHO RETURN TO THEIR MASTERS—COMPELLED TO TELL MY CONDITION—SUCCORED BY A SAILOR—DAVID RUGGLES—THE UNDERGROUND RAILROAD—MARRIAGE—BAGGAGE TAKEN FROM ME—KINDNESS OF NATHAN JOHNSON—MY CHANGE OF NAME—DARK NOTIONS OF NORTHERN CIVILIZATION—THE CONTRAST—COLORED PEOPLE IN NEW BEDFORD—AN INCIDENT ILLUSTRATING THEIR SPIRIT—A COMMON LABORER—DENIED WORK AT MY TRADE—THE FIRST WINTER AT THE NORTH—REPULSE AT THE DOORS OF THE CHURCH—SANCTIFIED HATE—THE _Liberator_ AND ITS EDITOR.

There is no necessity for any extended notice of the incidents of this part of my life. There is nothing very striking or peculiar about my career as a freeman, when viewed apart from my life as a slave. The relation subsisting between my early experience and that which I am now about to narrate, is, perhaps, my best apology for adding another chapter to this book.

Disappearing from the kind reader, in a flying cloud or balloon (pardon the figure), driven by the wind, and knowing not where I should land—whether in slavery or in freedom—it is proper that I should remove, at once, all anxiety, by frankly making known where I alighted. The flight was a bold and perilous one; but here I am, in the great city of New York, safe and sound, without loss of blood or bone. In less than a week after leaving Baltimore, I was walking amid the hurrying throng, and gazing upon the dazzling wonders of Broadway. The dreams of my childhood and the purposes of my manhood were now fulfilled. A free state around me, and a free earth under my feet! What a moment was this to me! A whole year was pressed into a single day. A new world burst upon my agitated vision. I have often been asked, by kind friends to whom I have told my story, how I felt when first I found myself beyond the limits of slavery; and I must say here, as I have often said to them, there is scarcely anything about which I could not give a more satisfactory answer. It was a moment of joyous excitement, which no words can describe. In a letter to a friend, written soon after reaching New York. I said I felt as one might be supposed to feel, on escaping from a den of hungry lions. But, in a moment like that, sensations are too intense and too rapid for words. Anguish and grief, like darkness and rain, may be described, but joy and gladness, like the rainbow of promise, defy alike the pen and pencil.

For ten or fifteen years I had been dragging a heavy chain, with a huge block attached to it, cumbering my every motion. I had felt myself doomed to drag this chain and this block through life. All efforts, before, to separate myself from the hateful encumbrance, had only seemed to rivet me the more firmly to it. Baffled and discouraged at times, I had asked myself the question, May not this, after all, be God's work? May He not, for wise ends, have doomed me to this lot? A contest had been going on in my mind for years, between the clear consciousness of right and the plausible errors of superstition; between the wisdom of manly courage, and the foolish weakness of timidity. The contest was now ended; the chain was severed; God and right stood vindicated. I was A FREEMAN, and the voice of peace and joy thrilled my heart.

Free and joyous, however, as I was, joy was not the only sensation I experienced. It was like the quick blaze, beautiful at the first, but which subsiding, leaves the building charred and desolate. I was soon taught that I was still in an enemy's land. A sense of loneliness and insecurity oppressed me sadly. I had been but a few hours in New York, before I was met in the streets by a fugitive slave, well known to me, and the information I got from him respecting New York, did nothing to lessen my apprehension of danger. The fugitive in question was "Allender's Jake," in Baltimore; but, said he, I am "WILLIAM DIXON," in New York! I knew Jake well, and knew when Tolly Allender and Mr. Price (for the latter employed Master Hugh as his foreman, in his shipyard on Fell's Point) made an attempt to recapture Jake, and failed. Jake told me all about his circumstances, and how narrowly he escaped being taken back to slavery; that the city was now full of southerners, returning from the springs; that the black people in New York were not to be trusted; that there were hired men on the lookout for fugitives from slavery, and who, for a few dollars, would betray me into the hands of the slave-catchers; that I must trust no man with my secret; that I must not think of going either on the wharves to work, or to a boarding-house to board; and, worse still, this same Jake told me it was not in his power to help me. He seemed, even while cautioning me, to be fearing lest, after all, I might be a party to a second attempt to recapture him. Under the inspiration of this thought, I must suppose it was, he gave signs of a wish to get rid of me, and soon left me his whitewash brush in hand—as he said, for his work. He was soon lost to sight among the throng, and I was alone again, an easy prey to the kidnappers, if any should happen to be on my track.

New York, seventeen years ago, was less a place of safety for a runaway slave than now, and all know how unsafe it now is, under the new fugitive slave bill. I was much troubled. I had very little money enough to buy me a few loaves of bread, but not enough to pay board, outside a lumber yard. I saw the wisdom of keeping away from the ship yards, for if Master Hugh pursued me, he would naturally expect to find me looking for work among the calkers. For a time, every door seemed closed against me. A sense of my loneliness and helplessness crept over me, and covered me with something bordering on despair. In the midst of thousands of my fellowmen, and yet a perfect stranger! In the midst of human brothers, and yet more fearful of them than of hungry wolves! I was without home, without friends, without work, without money, and without any definite knowledge of which way to go, or where to look for succor.

Some apology can easily be made for the few slaves who have, after making good their escape, turned back to slavery, preferring the actual rule of their masters, to the life of loneliness, apprehension, hunger, and anxiety, which meets them on their first arrival in a free state. It is difficult for a freeman to enter into the feelings of such fugitives. He cannot see things in the same light with the slave, because he does not, and cannot, look from the same point from which the slave does. “Why do you tremble,” he says to the slave “you are in a free state;” but the difficulty is, in realizing that he is in a free state, the slave might reply. A freeman cannot understand why the slave-master’s shadow is bigger, to the slave, than the might and majesty of a free state; but when he reflects that the slave knows more about the slavery of his master than he does of the might and majesty of the free state, he has the explanation. The slave has been all his life learning the power of his master—being trained to dread his approach—and only a few hours learning the power of the state. The master is to him a stern and flinty reality, but the state is little more than a dream. He has been accustomed to regard every white man as the friend of his master, and every colored man as more or less under the control of his master’s friends—the white people. It takes stout nerves to stand up, in such circumstances. A man, homeless, shelterless, breadless, friendless, and moneyless, is not in a condition to assume a very proud or joyous tone; and in just this condition was I, while wandering about the streets of New York city and lodging, at least one night, among the barrels on one of its wharves. I was not only free from slavery, but I was free from home, as well. The reader will easily see that I had something more than the simple fact of being free to think of, in this extremity.

I kept my secret as long as I could, and at last was forced to go in search of an honest man—a man sufficiently _human_ not to betray me into the hands of slave-catchers. I was not a bad reader of the human face, nor long in selecting the right man, when once compelled to disclose the facts of my condition to some one.

I found my man in the person of one who said his name was Stewart. He was a sailor, warm-hearted and generous, and he listened to my story with a brother’s interest. I told him I was running for my freedom—knew not where to go—money almost gone—was hungry—thought it unsafe to go the shipyards for work, and needed a friend. Stewart promptly put me in the way of getting out of my trouble. He took me to his house, and went in search of the late David Ruggles, who was then the secretary of the New York Vigilance Committee, and a very active man in all anti-slavery works. Once in the hands of Mr. Ruggles, I was comparatively safe. I was hidden with Mr. Ruggles several days. In the meantime, my intended wife, Anna, came on from Baltimore—to whom I had written, informing her of my safe arrival at New York—and, in the presence of Mrs. Mitchell and Mr. Ruggles, we were married, by Rev. James W. C. Pennington.

Mr. Ruggles 7 was the first officer on the under-ground railroad with whom I met after reaching the north, and, indeed, the first of whom I ever heard anything. Learning that I was a calker by trade, he promptly decided that New Bedford was the proper place to send me. “Many ships,” said he, “are there fitted out for the whaling business, and you may there find work at your trade, and make a good living.” Thus, in one fortnight after my flight from Maryland, I was safe in New Bedford, regularly entered upon the exercise of the rights, responsibilities, and duties of a freeman.

I may mention a little circumstance which annoyed me on reaching New Bedford. I had not a cent of money, and lacked two dollars toward paying our fare from Newport, and our baggage not very costly—was taken by the stage driver, and held until I could raise the money to redeem it. This difficulty was soon surmounted. Mr. Nathan Johnson, to whom we had a line from Mr. Ruggles, not only received us kindly and hospitably, but, on being informed about our baggage, promptly loaned me two dollars with which to redeem my little property. I shall ever be deeply grateful, both to Mr. and Mrs. Nathan Johnson, for the lively interest they were pleased to take in me, in this hour of my extremest need. They not only gave myself and wife bread and shelter, but taught us how to begin to secure those benefits for ourselves. Long may they live, and may blessings attend them in this life and in that which is to come!

Once initiated into the new life of freedom, and assured by Mr. Johnson that New Bedford was a safe place, the comparatively unimportant matter, as to what should be my name, came up for considertion(sic). It was necessary to have a name in my new relations. The name given me by my beloved mother was no less pretentious than “Frederick Augustus Washington Bailey.” I had, however, before leaving Maryland, dispensed with the _Augustus Washington_, and retained the name _Frederick Bailey_. Between Baltimore and New Bedford, however, I had several different names, the better to avoid being overhauled by the hunters, which I had good reason to believe would be put on my track. Among honest men an honest man may well be content with one name, and to acknowledge it at all times and in all places; but toward fugitives, Americans are not honest. When I arrived at New Bedford, my name was Johnson; and finding that the Johnson family in New Bedford were already quite numerous—sufficiently so to produce some confusion in attempts to distinguish one from another—there was the more reason for making another change in my name. In fact, “Johnson” had been assumed by nearly every slave who had arrived in New Bedford from Maryland, and this, much to the annoyance of the original “Johnsons” (of whom there were many) in that place. Mine host, unwilling to have another of his own name added to the community in this unauthorized way, after I spent a night and a day at his house, gave me my present name. He had been reading the “Lady of the Lake,” and was pleased to regard me as a suitable person to wear this, one of Scotland’s many famous names. Considering the noble hospitality and manly character of Nathan Johnson, I have felt that he, better than I, illustrated the virtues of the great Scottish chief. Sure I am, that had any slave-catcher entered his domicile, with a view to molest any one of his household, he would have shown himself like him of the “stalwart hand.”

The reader will be amused at my ignorance, when I tell the notions I had of the state of northern wealth, enterprise, and civilization. Of wealth and refinement, I supposed the north had none. My _Columbian Orator_, which was almost my only book, had not done much to enlighten me concerning northern society. The impressions I had received were all wide of the truth. New Bedford, especially, took me by surprise, in the solid wealth and grandeur there exhibited. I had formed my notions respecting the social condition of the free states, by what I had seen and known of free, white, non-slaveholding people in the slave states. Regarding slavery as the basis of wealth, I fancied that no people could become very wealthy without slavery. A free white man, holding no slaves, in the country, I had known to be the most ignorant and poverty-stricken of men, and the laughing stock even of slaves themselves—called generally by them, in derision, _“poor white trash_.” Like the non-slaveholders at the south, in holding no slaves, I suppose the northern people like them, also, in poverty and degradation. Judge, then, of my amazement and joy, when I found—as I did find—the very laboring population of New Bedford living in better houses, more elegantly furnished—surrounded by more comfort and refinement—than a majority of the slaveholders on the Eastern Shore of Maryland. There was my friend, Mr. Johnson, himself a colored man (who at the south would have been regarded as a proper marketable commodity), who lived in a better house—dined at a richer board—was the owner of more books—the reader of more newspapers—was more conversant with the political and social condition of this nation and the world—than nine-tenths of all the slaveholders of Talbot county, Maryland. Yet Mr. Johnson was a working man, and his hands were hardened by honest toil. Here, then, was something for observation and study. Whence the difference? The explanation was soon furnished, in the superiority of mind over simple brute force. Many pages might be given to the contrast, and in explanation of its causes. But an incident or two will suffice to show the reader as to how the mystery gradually vanished before me.

My first afternoon, on reaching New Bedford, was spent in visiting the wharves and viewing the shipping. The sight of the broad brim and the plain, Quaker dress, which met me at every turn, greatly increased my sense of freedom and security. “I am among the Quakers,” thought I, “and am safe.” Lying at the wharves and riding in the stream, were full-rigged ships of finest model, ready to start on whaling voyages. Upon the right and the left, I was walled in by large granite-fronted warehouses, crowded with the good things of this world. On the wharves, I saw industry without bustle, labor without noise, and heavy toil without the whip. There was no loud singing, as in southern ports, where ships are loading or unloading—no loud cursing or swearing—but everything went on as smoothly as the works of a well adjusted machine. How different was all this from the nosily fierce and clumsily absurd manner of labor-life in Baltimore and St. Michael’s! One of the first incidents which illustrated the superior mental character of northern labor over that of the south, was the manner of unloading a ship’s cargo of oil. In a southern port, twenty or thirty hands would have been employed to do what five or six did here, with the aid of a single ox attached to the end of a fall. Main strength, unassisted by skill, is slavery’s method of labor. An old ox, worth eighty dollars, was doing, in New Bedford, what would have required fifteen thousand dollars worth of human bones and muscles to have performed in a southern port. I found that everything was done here with a scrupulous regard to economy, both in regard to men and things, time and strength. The maid servant, instead of spending at least a tenth part of her time in bringing and carrying water, as in Baltimore, had the pump at her elbow. The wood was dry, and snugly piled away for winter. Woodhouses, in-door pumps, sinks, drains, self-shutting gates, washing machines, pounding barrels, were all new things, and told me that I was among a thoughtful and sensible people. To the ship-repairing dock I went, and saw the same

wise prudence. The carpenters struck where they aimed, and the calkers wasted no blows in idle flourishes of the mallet. I learned that men went from New Bedford to Baltimore, and bought old ships, and brought them here to repair, and made them better and more valuable than they ever were before. Men talked here of going whaling on a four _years'_ voyage with more coolness than sailors where I came from talked of going a four _months'_ voyage.

I now find that I could have landed in no part of the United States, where I should have found a more striking and gratifying contrast to the condition of the free people of color in Baltimore, than I found here in New Bedford. No colored man is really free in a slaveholding state. He wears the badge of bondage while nominally free, and is often subjected to hardships to which the slave is a stranger; but here in New Bedford, it was my good fortune to see a pretty near approach to freedom on the part of the colored people. I was taken all aback when Mr. Johnson—who lost no time in making me acquainted with the fact—told me that there was nothing in the constitution of Massachusetts to prevent a colored man from holding any office in the state. There, in New Bedford, the black man's children—although anti-slavery was then far from popular—went to school side by side with the white children, and apparently without objection from any quarter. To make me at home, Mr. Johnson assured me that no slaveholder could take a slave from New Bedford; that there were men there who would lay down their lives, before such an outrage could be perpetrated. The colored people themselves were of the best metal, and would fight for liberty to the death.

Soon after my arrival in New Bedford, I was told the following story, which was said to illustrate the spirit of the colored people in that goodly town: A colored man and a fugitive slave happened to have a little quarrel, and the former was heard to threaten the latter with informing his master of his whereabouts. As soon as this threat became known, a notice was read from the desk of what was then the only colored church in the place, stating that business of importance was to be then and there transacted. Special measures had been taken to secure the attendance of the would-be Judas, and had proved successful. Accordingly, at the hour appointed, the people came, and the betrayer also. All the usual formalities of public meetings were scrupulously gone through, even to the offering prayer for Divine direction in the duties of the occasion. The president himself performed this part of the ceremony, and I was told that he was unusually fervent. Yet, at the close of his prayer, the old man (one of the numerous family of Johnsons) rose from his knees, deliberately surveyed his audience, and then said, in a tone of solemn resolution, _"Well, friends, we have got him here, and I would now recommend that you young men should just take him outside the door and kill him."_ With this, a large body of the congregation, who well understood the business they had come there to transact, made a rush at the villain, and doubtless would have killed him, had he not availed himself of an open sash, and made good his escape. He has never shown his head in New Bedford since that time. This little incident is perfectly characteristic of the spirit of the colored people in New Bedford. A slave could not be taken from that town seventeen years ago, any more than he could be so taken away now. The reason is, that the colored people in that city are educated up to the point of fighting for their freedom, as well as speaking for it.

Once assured of my safety in New Bedford, I put on the habiliments of a common laborer, and went on the wharf in search of work. I had no notion of living on the honest and generous sympathy of my colored brother, Johnson, or that of the abolitionists. My cry was like that of Hood's laborer, "Oh! only give me work." Happily for me, I was not long in searching. I found employment, the third day after my arrival in New Bedford, in stowing a sloop with a load of oil for the New York market. It was new, hard, and dirty work, even for a calker, but I went at it with a glad heart and a willing hand. I was now my own master—a tremendous fact—and the rapturous excitement with which I seized the job, may not easily be understood, except by some one with an experience like mine. The thoughts—"I can work! I can work for a living; I am not afraid of work; I have no Master Hugh to rob me of my earnings"—placed me in a state of independence, beyond seeking friendship or support of any man. That day's work I considered the real starting point of something like a new existence. Having finished this job and got my pay for the same, I went next in pursuit of a job at calking. It so happened that Mr. Rodney French, late mayor of the city of New Bedford, had a ship fitting out for sea, and to which there was a large job of calking and coppering to be done. I applied to that noblehearted man for employment, and he promptly told me to go to work; but going on the float-stage for the purpose, I was informed that every white man would leave the ship if I struck a blow upon her. "Well, well," thought I, "this is a hardship, but yet not a very serious one for me." The difference between the wages of a calker and that of a common day laborer, was an hundred per cent in favor of the former; but then I was free, and free to work, though not at my trade. I now prepared myself to do anything which came to hand in the way of turning an honest penny; sawed wood—dug cellars—shoveled coal—swept chimneys with Uncle Lucas Debuty—rolled oil casks on the wharves—helped to load and unload vessels—worked in Ricketson's candle works—in Richmond's brass foundery, and elsewhere; and thus supported myself and family for three years.

The first winter was unusually severe, in consequence of the high prices of food; but even during that winter we probably suffered less than many who had been free all their lives. During the hardest of the winter, I hired out for nine dolars(sic) a month; and out of

this rented two rooms for nine dollars per quarter, and supplied my wife—who was unable to work—with food and some necessary articles of furniture. We were closely pinched to bring our wants within our means; but the jail stood over the way, and I had a wholesome dread of the consequences of running in debt. This winter past, and I was up with the times—got plenty of work—got well paid for it—and felt that I had not done a foolish thing to leave Master Hugh and Master Thomas. I was now living in a new world, and was wide awake to its advantages. I early began to attend the meetings of the colored people of New Bedford, and to take part in them. I was somewhat amazed to see colored men drawing up resolutions and offering them for consideration. Several colored young men of New Bedford, at that period, gave promise of great usefulness. They were educated, and possessed what seemed to me, at the time, very superior talents. Some of them have been cut down by death, and others have removed to different parts of the world, and some remain there now, and justify, in their present activities, my early impressions of them.

Among my first concerns on reaching New Bedford, was to become united with the church, for I had never given up, in reality, my religious faith. I had become lukewarm and in a backslidden state, but I was still convinced that it was my duty to join the Methodist church. I was not then aware of the powerful influence of that religious body in favor of the enslavement of my race, nor did I see how the northern churches could be responsible for the conduct of southern churches; neither did I fully understand how it could be my duty to remain separate from the church, because bad men were connected with it. The slaveholding church, with its Coveys, Weedens, Aulds, and Hopkins, I could see through at once, but I could not see how Elm Street church, in New Bedford, could be regarded as sanctioning the Christianity of these characters in the church at St. Michael's. I therefore resolved to join the Methodist church in New Bedford, and to enjoy the spiritual advantage of public worship. The minister of the Elm Street Methodist church, was the Rev. Mr. Bonney; and although I was not allowed a seat in the body of the house, and was proscribed on account of my color, regarding this proscription simply as an accommodation of the uncoverted congregation who had not yet been won to Christ and his brotherhood, I was willing thus to be proscribed, lest sinners should be driven away form the saving power of the gospel. Once converted, I thought they would be sure to treat me as a man and a brother. "Surely," thought I, "these Christian people have none of this feeling against color. They, at least, have renounced this unholy feeling." Judge, then, dear reader, of my astonishment and mortification, when I found, as soon I did find, all my charitable assumptions at fault.

An opportunity was soon afforded me for ascertaining the exact position of Elm Street church on that subject. I had a chance of seeing the religious part of the congregation by themselves; and although they disowned, in effect, their black brothers and sisters, before the world, I did think that where none but the saints were assembled, and no offense could be given to the wicked, and the gospel could not be "blamed," they would certainly recognize us as children of the same Father, and heirs of the same salvation, on equal terms with themselves.

The occasion to which I refer, was the sacrament of the Lord's Supper, that most sacred and most solemn of all the ordinances of the Christian church. Mr. Bonney had preached a very solemn and searching discourse, which really proved him to be acquainted with the inmost secerts(sic) of the human heart. At the close of his discourse, the congregation was dismissed, and the church remained to partake of the sacrament. I remained to see, as I thought, this holy sacrament celebrated in the spirit of its great Founder.

There were only about a half dozen colored members attached to the Elm Street church, at this time. After the congregation was dismissed, these descended from the gallery, and took a seat against the wall most distant from the altar. Brother Bonney was very animated, and sung very sweetly, "Salvation 'tis a joyful sound," and soon began to administer the sacrament. I was anxious to observe the bearing of the colored members, and the result was most humiliating. During the whole ceremony, they looked like sheep without a shepherd. The white members went forward to the altar by the bench full; and when it was evident that all the whites had been served with the bread and wine, Brother Bonney—pious Brother Bonney—after a long pause, as if inquiring whether all the whites members had been served, and fully assuring himself on that important point, then raised his voice to an unnatural pitch, and looking to the corner where his black sheep seemed penned, beckoned with his hand, exclaiming, "Come forward, colored friends! come forward! You, too, have an interest in the blood of Christ. God is no respecter of persons. Come forward, and take this holy sacrament to your comfort." The colored members poor, slavish souls went forward, as invited. I went out, and have never been in that church since, although I honestly went there with a view to joining that body. I found it impossible to respect the religious profession of any who were under the dominion of this wicked prejudice, and I could not, therefore, feel that in joining them, I was joining a Christian church, at all. I tried other churches in New Bedford, with the same result, and finally, I attached myself to a small body of colored Methodists, known as the Zion Methodists. Favored with the affection and confidence of the members of this humble communion, I was soon made a classleader and a local preacher among them. Many seasons of peace and joy I experienced among them, the remembrance of which is still precious, although I could not see it to be my duty to

remain with that body, when I found that it consented to the same spirit which held my brethren in chains.

In four or five months after reaching New Bedford, there came a young man to me, with a copy of the _Liberator_, the paper edited by WILLIAM LLOYD GARRISON, and published by ISAAC KNAPP, and asked me to subscribe for it. I told him I had but just escaped from slavery, and was of course very poor, and remarked further, that I was unable to pay for it then; the agent, however, very willingly took me as a subscriber, and appeared to be much pleased with securing my name to his list. From this time I was brought in contact with the mind of William Lloyd Garrison. His paper took its place with me next to the bible.

The _Liberator_ was a paper after my own heart. It detested slavery exposed hypocrisy and wickedness in high places—made no truce with the traffickers in the bodies and souls of men; it preached human brotherhood, denounced oppression, and, with all the solemnity of God's word, demanded the complete emancipation of my race. I not only liked—I _loved_ this paper, and its editor. He seemed a match for all the oponents(sic) of emancipation, whether they spoke in the name of the law, or the gospel. His words were few, full of holy fire, and straight to the point. Learning to love him, through his paper, I was prepared to be pleased with his presence. Something of a hero worshiper, by nature, here was one, on first sight, to excite my love and reverence.

Seventeen years ago, few men possessed a more heavenly countenance than William Lloyd Garrison, and few men evinced a more genuine or a more exalted piety. The bible was his text book—held sacred, as the word of the Eternal Father—sinless perfection—complete submission to insults and injuries—literal obedience to the injunction, if smitten on one side to turn the other also. Not only was Sunday a Sabbath, but all days were Sabbaths, and to be kept holy. All sectarism false and mischievous—the regenerated, throughout the world, members of one body, and the HEAD Christ Jesus. Prejudice against color was rebellion against God. Of all men beneath the sky, the slaves, because most neglected and despised, were nearest and dearest to his great heart. Those ministers who defended slavery from the bible, were of their "father the devil"; and those churches which fellowshiped slaveholders as Christians, were synagogues of Satan, and our nation was a nation of liars. Never loud or noisy—calm and serene as a summer sky, and as pure. "You are the man, the Moses, raised up by God, to deliver his modern Israel from bondage," was the spontaneous feeling of my heart, as I sat away back in the hall and listened to his mighty words; mighty in truth—mighty in their simple earnestness.

I had not long been a reader of the _Liberator_, and listener to its editor, before I got a clear apprehension of the principles of the anti-slavery movement. I had already the spirit of the movement, and only needed to understand its principles and measures. These I got from the _Liberator_, and from those who believed in that paper. My acquaintance with the movement increased my hope for the ultimate freedom of my race, and I united with it from a sense of delight, as well as duty.

Every week the _Liberator_ came, and every week I made myself master of its contents. All the anti-slavery meetings held in New Bedford I promptly attended, my heart burning at every true utterance against the slave system, and every rebuke of its friends and supporters. Thus passed the first three years of my residence in New Bedford. I had not then dreamed of the posibility(sic) of my becoming a public advocate of the cause so deeply imbedded in my heart. It was enough for me to listen—to receive and applaud the great words of others, and only whisper in private, among the white laborers on the wharves, and elsewhere, the truths which burned in my breast.

CHAPTER XXIII. _Introduced to the Abolitionists_

FIRST SPEECH AT NANTUCKET—MUCH SENSATION—EXTRAORDINARY SPEECH OF MR. GARRISON—AUTHOR BECOMES A PUBLIC LECTURER—FOURTEEN YEARS EXPERIENCE—YOUTHFUL ENTHUSIASM—A BRAND NEW FACT—MATTER OF MY AUTHOR'S SPEECH—COULD NOT FOLLOW THE PROGRAMME—FUGITIVE SLAVESHIP DOUBTED—TO SETTLE ALL DOUBT I WRITE MY EXPERIENCE OF SLAVERY—DANGER OF RECAPTURE INCREASED.

In the summer of 1841, a grand anti-slavery convention was held in Nantucket, under the auspices of Mr. Garrison and his friends. Until now, I had taken no holiday since my escape from slavery. Having worked very hard that spring and summer, in Richmond's brass foundery—sometimes working all night as well as all day—and needing a day or two of rest, I attended this convention, never supposing that I should take part in the proceedings. Indeed, I was not aware that any one connected with the convention even so much as knew my name. I was, however, quite mistaken. Mr. William C. Coffin, a prominent abolitionst(sic) in those days of trial, had heard me speaking to my colored friends, in the little school house on Second street, New Bedford, where we worshiped. He sought me out in the crowd, and invited me to say a few words to the convention. Thus sought out, and thus invited, I was induced to speak out the feelings inspired by the occasion, and the fresh recollection of the scenes through which I had passed as a slave.

My speech on this occasion is about the only one I ever made, of which I do not remember a single connected sentence. It was with the utmost difficulty that I could stand erect, or that I could command and articulate two words without hesitation and stammering. I trembled in every limb. I am not sure that my embarrassment was not the most effective part of my speech, if speech it could be called. At any rate, this is about the only part of my performance that I now distinctly remember. But excited and convulsed as I was, the audience, though remarkably quiet before, became as much excited as myself. Mr. Garrison followed me, taking me as his text; and now, whether I had made an eloquent speech in behalf of freedom or not, his was one never to be forgotten by those who heard it. Those who had heard Mr. Garrison oftenest, and had known him longest, were astonished. It was an effort of unequaled power, sweeping down, like a very tornado, every opposing barrier, whether of sentiment or opinion. For a moment, he possessed that almost fabulous inspiration, often referred to but seldom attained, in which a public meeting is transformed, as it were, into a single individuality—the orator wielding a thousand heads and hearts at once, and by the simple majesty of his all controlling thought, converting his hearers into the express image of his own soul. That night there were at least one thousand Garrisonians in Nantucket! A(sic) the close of this great meeting, I was duly waited on by Mr. John A. Collins—then the general agent of the Massachusetts anti-slavery society—and urgently solicited by him to become an agent of that society, and to publicly advocate its anti-slavery principles. I was reluctant to take the proffered position. I had not been quite three years from slavery—was honestly distrustful of my ability—wished to be excused; publicity exposed me to discovery and arrest by my master; and other objections came up, but Mr. Collins was not to be put off, and I finally consented to go out for three months, for I supposed that I should have got to the end of my story and my usefulness, in that length of time.

Here opened upon me a new life a life for which I had had no preparation. I was a “graduate from the peculiar institution,” Mr. Collins used to say, when introducing me, _“with my diploma written on my back!”_ The three years of my freedom had been spent in the hard school of adversity. My hands had been furnished by nature with something like a solid leather coating, and I had bravely marked out for myself a life of rough labor, suited to the hardness of my hands, as a means of supporting myself and rearing my children.

Now what shall I say of this fourteen years’ experience as a public advocate of the cause of my enslaved brothers and sisters? The time is but as a speck, yet large enough to justify a pause for retrospection—and a pause it must only be.

Young, ardent, and hopeful, I entered upon this new life in the full gush of unsuspecting enthusiasm. The cause was good; the men engaged in it were good; the means to attain its triumph, good; Heaven’s blessing must attend all, and freedom must soon be given to the pining millions under a ruthless bondage. My whole heart went with the holy cause, and my most fervent prayer to the Almighty Disposer of the hearts of men, were continually offered for its early triumph. “Who or what,” thought I, “can withstand a cause so good, so holy, so indescribably glorious. The God of Israel is with us. The might of the Eternal is on our side. Now let but the truth be spoken, and a nation will start forth at the sound!” In this enthusiastic spirit, I dropped into the ranks of freedom’s friends, and went forth to the battle. For a time I was made to forget that my skin was dark and my hair crisped. For a time I regretted that I could not have shared the hardships and dangers endured by the earlier workers for the slave’s release. I soon, however, found that my enthusiasm had been extravagant; that hardships and dangers were not yet passed; and that the life now before me, had shadows as well as sunbeams.

Among the first duties assigned me, on entering the ranks, was to travel, in company with Mr. George Foster, to secure subscribers to the _Anti-slavery Standard_ and the _Liberator_. With him I traveled and lectured through the eastern counties of Massachusetts. Much interest was awakened—large meetings assembled. Many came, no doubt, from curiosity to hear what a Negro could say in his own cause. I was generally introduced as a _“chattel”—_a_“thing”_—a piece of southern _“property”_—the chairman assuring the audience that _it_ could speak. Fugitive slaves, at that time, were not so plentiful as now; and as a fugitive slave lecturer, I had the advantage of being a _“brand new fact”_—the first one out. Up to that time, a colored man was deemed a fool who confessed himself a runaway slave, not only because of the danger to which he exposed himself of being retaken, but because it was a confession of a very _low_ origin! Some of my colored friends in New Bedford thought very badly of my wisdom for thus exposing and degrading myself. The only precaution I took, at the beginning, to prevent Master Thomas from knowing where I was, and what I was about, was the withholding my former name, my master’s name, and the name of the state and county from which I came. During the first three or four months, my speeches were almost exclusively made up of narrations of my own personal experience as a slave. “Let us have the facts,” said the people. So also said Friend George Foster, who always wished to pin me down to my simple narrative. “Give us the facts,” said Collins, “we will take care of the philosophy.” Just here arose some embarrassment. It was impossible for me to repeat the same old story month after month, and to keep up my interest in it. It was new to the people, it is true, but it was an old story to me; and to go through with it night after night, was a task altogether too

mechanical for my nature. “Tell your story, Frederick,” would whisper my then revered friend, William Lloyd Garrison, as I stepped upon the platform. I could not always obey, for I was now reading and thinking. New views of the subject were presented to my mind. It did not entirely satisfy me to _narrate_ wrongs; I felt like _denouncing_ them. I could not always curb my moral indignation for the perpetrators of slaveholding villainy, long enough for a circumstantial statement of the facts which I felt almost everybody must know. Besides, I was growing, and needed room. “People won’t believe you ever was a slave, Frederick, if you keep on this way,” said Friend Foster. “Be yourself,” said Collins, “and tell your story.” It was said to me, “Better have a _little_ of the plantation manner of speech than not; ‘tis not best that you seem too learned.” These excellent friends were actuated by the best of motives, and were not altogether wrong in their advice; and still I must speak just the word that seemed to _me_ the word to be spoken _by_ me.

At last the apprehended trouble came. People doubted if I had ever been a slave. They said I did not talk like a slave, look like a slave, nor act like a slave, and that they believed I had never been south of Mason and Dixon’s line. “He don’t tell us where he came from—what his master’s name was—how he got away—nor the story of his experience. Besides, he is educated, and is, in this, a contradiction of all the facts we have concerning the ignorance of the slaves.” Thus, I was in a pretty fair way to be denounced as an impostor. The committee of the Massachusetts anti-slavery society knew all the facts in my case, and agreed with me in the prudence of keeping them private. They, therefore, never doubted my being a genuine fugitive; but going down the aisles of the churches in which I spoke, and hearing the free spoken Yankees saying, repeatedly, _“He’s never been a slave, I’ll warrant ye_,” I resolved to dispel all doubt, at no distant day, by such a revelation of facts as could not be made by any other than a genuine fugitive.

In a little less than four years, therefore, after becoming a public lecturer, I was induced to write out the leading facts connected with my experience in slavery, giving names of persons, places, and dates—thus putting it in the power of any who doubted, to ascertain the truth or falsehood of my story of being a fugitive slave. This statement soon became known in Maryland, and I had reason to believe that an effort would be made to recapture me.

It is not probable that any open attempt to secure me as a slave could have succeeded, further than the obtainment, by my master, of the money value of my bones and sinews. Fortunately for me, in the four years of my labors in the abolition cause, I had gained many friends, who would have suffered themselves to be taxed to almost any extent to save me from slavery. It was felt that I had committed the double offense of running away, and exposing the secrets and crimes of slavery and slaveholders. There was a double motive for seeking my reenslavement—avarice and vengeance; and while, as I have said, there was little probability of successful recapture, if attempted openly, I was constantly in danger of being spirited away, at a moment when my friends could render me no assistance. In traveling about from place to place—often alone I was much exposed to this sort of attack. Any one cherishing the design to betray me, could easily do so, by simply tracing my whereabouts through the anti-slavery journals, for my meetings and movements were promptly made known in advance. My true friends, Mr. Garrison and Mr. Phillips, had no faith in the power of Massachusetts to protect me in my right to liberty. Public sentiment and the law, in their opinion, would hand me over to the tormentors. Mr. Phillips, especially, considered me in danger, and said, when I showed him the manuscript of my story, if in my place, he would throw it into the fire. Thus, the reader will observe, the settling of one difficulty only opened the way for another; and that though I had reached a free state, and had attained position for public usefulness, I ws(sic) still tormented with the liability of losing my liberty. How this liability was dispelled, will be related, with other incidents, in the next chapter.

CHAPTER XXIV. _Twenty-One Months in Great Britain_

GOOD ARISING OUT OF UNPROPITIOUS EVENTS—DENIED CABIN PASSAGE—PROSCRIPTION TURNED TO GOOD ACCOUNT—THE HUTCHINSON FAMILY—THE MOB ON BOARD THE “CAMBRIA”—HAPPY INTRODUCTION TO THE BRITISH PUBLIC—LETTER ADDRESSED TO WILLIAM LLOYD GARRISON—TIME AND LABORS WHILE ABROAD—FREEDOM PURCHASED—MRS. HENRY RICHARDSON—FREE PAPERS—ABOLITIONISTS DISPLEASED WITH THE RANSOM—HOW MY ENERGIES WERE DIRECTED—RECEPTION SPEECH IN LONDON—CHARACTER OF THE SPEECH DEFENDED—CIRCUMSTANCES EXPLAINED—CAUSES CONTRIBUTING TO THE SUCCESS OF MY MISSION—FREE CHURCH OF SCOTLAND—TESTIMONIAL.

The allotments of Providence, when coupled with trouble and anxiety, often conceal from finite vision the wisdom and goodness in which they are sent; and, frequently, what seemed a harsh and invidious dispensation, is converted by after experience into a happy and beneficial arrangement. Thus, the painful liability to be returned again to slavery, which haunted me by day, and troubled

my dreams by night, proved to be a necessary step in the path of knowledge and usefulness. The writing of my pamphlet, in the spring of 1845, endangered my liberty, and led me to seek a refuge from republican slavery in monarchical England. A rude, uncultivated fugitive slave was driven, by stern necessity, to that country to which young American gentlemen go to increase their stock of knowledge, to seek pleasure, to have their rough, democratic manners softened by contact with English aristocratic refinement. On applying for a passage to England, on board the “Cambria”, of the Cunard line, my friend, James N. Buffum, of Lynn, Massachusetts, was informed that I could not be received on board as a cabin passenger. American prejudice against color triumphed over British liberality and civilization, and erected a color test and condition for crossing the sea in the cabin of a British vessel. The insult was keenly felt by my white friends, but to me, it was common, expected, and therefore, a thing of no great consequence, whether I went in the cabin or in the steerage. Moreover, I felt that if I could not go into the first cabin, first-cabin passengers could come into the second cabin, and the result justified my anticipations to the fullest extent. Indeed, I soon found myself an object of more general interest than I wished to be; and so far from being degraded by being placed in the second cabin, that part of the ship became the scene of as much pleasure and refinement, during the voyage, as the cabin itself. The Hutchinson Family, celebrated vocalists—fellow-passengers—often came to my rude forecastle deck, and sung their sweetest songs, enlivening the place with eloquent music, as well as spirited conversation, during the voyage. In two days after leaving Boston, one part of the ship was about as free to me as another. My fellow-passengers not only visited me, but invited me to visit them, on the saloon deck. My visits there, however, were but seldom. I preferred to live within my privileges, and keep upon my own premises. I found this quite as much in accordance with good policy, as with my own feelings. The effect was, that with the majority of the passengers, all color distinctions were flung to the winds, and I found myself treated with every mark of respect, from the beginning to the end of the voyage, except in a single instance; and in that, I came near being mobbed, for complying with an invitation given me by the passengers, and the captain of the “Cambria,” to deliver a lecture on slavery. Our New Orleans and Georgia passengers were pleased to regard my lecture as an insult offered to them, and swore I should not speak. They went so far as to threaten to throw me overboard, and but for the firmness of Captain Judkins, probably would have (under the inspiration of _slavery_ and _brandy_) attempted to put their threats into execution. I have no space to describe this scene, although its tragic and comic peculiarities are well worth describing. An end was put to the _melee_, by the captain’s calling the ship’s company to put the salt water mobocrats in irons. At this determined order, the gentlemen of the lash scampered, and for the rest of the voyage conducted themselves very decorously.

This incident of the voyage, in two days after landing at Liverpool, brought me at once before the British public, and that by no act of my own. The gentlemen so promptly snubbed in their meditated violence, flew to the press to justify their conduct, and to denounce me as a worthless and insolent Negro. This course was even less wise than the conduct it was intended to sustain; for, besides awakening something like a national interest in me, and securing me an audience, it brought out counter statements, and threw the blame upon themselves, which they had sought to fasten upon me and the gallant captain of the ship.

Some notion may be formed of the difference in my feelings and circumstances, while abroad, from the following extract from one of a series of letters addressed by me to Mr. Garrison, and published in the _Liberator_. It was written on the first day of January, 1846:

MY DEAR FRIEND GARRISON: Up to this time, I have given no direct expression of the views, feelings, and opinions which I have formed, respecting the character and condition of the people of this land. I have refrained thus, purposely. I wish to speak advisedly, and in order to do this, I have waited till, I trust, experience has brought my opinions to an intelligent maturity. I have been thus careful, not because I think what I say will have much effect in shaping the opinions of the world, but because whatever of influence I may possess, whether little or much, I wish it to go in the right direction, and according to truth. I hardly need say that, in speaking of Ireland, I shall be influenced by no prejudices in favor of America. I think my circumstances all forbid that. I have no end to serve, no creed to uphold, no government to defend; and as to nation, I belong to none. I have no protection at home, or resting-place abroad. The land of my birth welcomes me to her shores only as a slave, and spurns with contempt the idea of treating me differently; so that I am an outcast from the society of my childhood, and an outlaw in the land of my birth. “I am a stranger with thee, and a sojourner, as all my fathers were.” That men should be patriotic, is to me perfectly natural; and as a philosophical fact, I am able to give it an _intellectual_ recognition. But no further can I go. If ever I had any patriotism, or any capacity for the feeling, it was whipped out of me long since, by the lash of the American soul-drivers.

In thinking of America, I sometimes find myself admiring her bright blue sky, her grand old woods, her fertile fields, her beautiful rivers, her mighty lakes, and star-crowned mountains. But my rapture is soon checked, my joy is soon turned to mourning. When I remember that all is cursed with the infernal spirit of slaveholding, robbery, and wrong; when I remember that with the waters of her

noblest rivers, the tears of my brethren are borne to the ocean, disregarded and forgotten, and that her most fertile fields drink daily of the warm blood of my outraged sisters; I am filled with unutterable loathing, and led to reproach myself that anything could fall from my lips in praise of such a land. America will not allow her children to love her. She seems bent on compelling those who would be her warmest friends, to be her worst enemies. May God give her repentance, before it is too late, is the ardent prayer of my heart. I will continue to pray, labor, and wait, believing that she cannot always be insensible to the dictates of justice, or deaf to the voice of humanity.

My opportunities for learning the character and condition of the people of this land have been very great. I have traveled almost from the Hill of Howth to the Giant's Causeway, and from the Giant's Causway, to Cape Clear. During these travels, I have met with much in the chara@@ and condition of the people to approve, and much to condemn; much that @@thrilled me with pleasure, and very much that has filled me with pain. I @@ @@t, in this letter, attempt to give any description of those scenes which have given me pain. This I will do hereafter. I have enough, and more than your subscribers will be disposed to read at one time, of the bright side of the picture. I can truly say, I have spent some of the happiest moments of my life since landing in this country. I seem to have undergone a transformation. I live a new life. The warm and generous cooperation extended to me by the friends of my despised race; the prompt and liberal manner with which the press has rendered me its aid; the glorious enthusiasm with which thousands have flocked to hear the cruel wrongs of my down-trodden and long-enslaved fellow-countrymen portrayed; the deep sympathy for the slave, and the strong abhorrence of the slaveholder, everywhere evinced; the cordiality with which members and ministers of various religious bodies, and of various shades of religious opinion, have embraced me, and lent me their aid; the kind of hospitality constantly proffered to me by persons of the highest rank in society; the spirit of freedom that seems to animate all with whom I come in contact, and the entire absence of everything that looked like prejudice against me, on account of the color of my skin—contrasted so strongly with my long and bitter experience in the United States, that I look with wonder and amazement on the transition. In the southern part of the United States, I was a slave, thought of and spoken of as property; in the language of the LAW, "_held, taken, reputed, and adjudged to be a chattel in the hands of my owners and possessors, and their executors, administrators, and assigns, to all intents, constructions, and purposes whatsoever_." (Brev. Digest, 224). In the northern states, a fugitive slave, liable to be hunted at any moment, like a felon, and to be hurled into the terrible jaws of slavery—doomed by an inveterate prejudice against color to insult and outrage on every hand (Massachusetts out of the question)—denied the privileges and courtesies common to others in the use of the most humble means of conveyance—shut out from the cabins on steamboats—refused admission to respectable hotels—caricatured, scorned, scoffed, mocked, and maltreated with impunity by any one (no matter how black his heart), so he has a white skin. But now behold the change! Eleven days and a half gone, and I have crossed three thousand miles of the perilous deep. Instead of a democratic government, I am under a monarchical government. Instead of the bright, blue sky of America, I am covered with the soft, grey fog of the Emerald Isle. I breathe, and lo! the chattel becomes a man. I gaze around in vain for one who will question my equal humanity, claim me as his slave, or offer me an insult. I employ a cab—I am seated beside white people—I reach the hotel—I enter the same door—I am shown into the same parlor—I dine at the same table and no one is offended. No delicate nose grows deformed in my presence. I find no difficulty here in obtaining admission into any place of worship, instruction, or amusement, on equal terms with people as white as any I ever saw in the United States. I meet nothing to remind me of my complexion. I find myself regarded and treated at every turn with the kindness and deference paid to white people. When I go to church, I am met by no upturned nose and scornful lip to tell me, "_We don't allow niggers in here_!"

I remember, about two years ago, there was in Boston, near the south-west corner of Boston Common, a menagerie. I had long desired to see such a collection as I understood was being exhibited there. Never having had an opportunity while a slave, I resolved to seize this, my first, since my escape. I went, and as I approached the entrance to gain admission, I was met and told by the door-keeper, in a harsh and contemptuous tone, "_We don't allow niggers in here_." I also remember attending a revival meeting in the Rev. Henry Jackson's meeting-house, at New Bedford, and going up the broad aisle to find a seat, I was met by a good deacon, who told me, in a pious tone, "_We don't allow niggers in here_!" Soon after my arrival in New Bedford, from the south, I had a strong desire to attend the Lyceum, but was told, "_They don't allow niggers in here_!" While passing from New York to Boston, on the steamer Massachusetts, on the night of the 9th of December, 1843, when chilled almost through with the cold, I went into the cabin to get a little warm. I was soon touched upon the shoulder, and told, "_We don't allow niggers in here_!" On arriving in Boston, from an anti-slavery tour, hungry and tired, I went into an eating-house, near my friend, Mr. Campbell's to get some refreshments. I was met by a lad in a white apron, "_We don't allow niggers in here_!" A week or two before leaving the United States, I had a meeting appointed at Weymouth, the home of that glorious band of true abolitionists, the Weston family, and others. On attempting to take a seat in the omnibus to that place, I was told by the driver (and I never shall forget his fiendish hate).

“_I don’t allow niggers in here_!” Thank heaven for the respite I now enjoy! I had been in Dublin but a few days, when a gentleman of great respectability kindly offered to conduct me through all the public buildings of that beautiful city; and a little afterward, I found myself dining with the lord mayor of Dublin. What a pity there was not some American democratic Christian at the door of his splendid mansion, to bark out at my approach, “_They don’t allow niggers in here_!” The truth is, the people here know nothing of the republican Negro hate prevalent in our glorious land. They measure and esteem men according to their moral and intellectual worth, and not according to the color of their skin. Whatever may be said of the aristocracies here, there is none based on the color of a man’s skin. This species of aristocracy belongs preeminently to “the land of the free, and the home of the brave.” I have never found it abroad, in any but Americans. It sticks to them wherever they go. They find it almost as hard to get rid of, as to get rid of their skins.

The second day after my arrival at Liverpool, in company with my friend, Buffum, and several other friends, I went to Eaton Hall, the residence of the Marquis of Westminster, one of the most splendid buildings in England. On approaching the door, I found several of our American passengers, who came out with us in the “Cambria,” waiting for admission, as but one party was allowed in the house at a time. We all had to wait till the company within came out. And of all the faces, expressive of chagrin, those of the Americans were preeminent. They looked as sour as vinegar, and as bitter as gall, when they found I was to be admitted on equal terms with themselves. When the door was opened, I walked in, on an equal footing with my white fellow-citizens, and from all I could see, I had as much attention paid me by the servants that showed us through the house, as any with a paler skin. As I walked through the building, the statuary did not fall down, the pictures did not leap from their places, the doors did not refuse to open, and the servants did not say, “_We don’t allow niggers in here_!”

A happy new-year to you, and all the friends of freedom.

My time and labors, while abroad were divided between England, Ireland, Scotland, and Wales. Upon this experience alone, I might write a book twice the size of this, _My Bondage and My Freedom_. I visited and lectured in nearly all the large towns and cities in the United Kingdom, and enjoyed many favorable opportunities for observation and information. But books on England are abundant, and the public may, therefore, dismiss any fear that I am meditating another infliction in that line; though, in truth, I should like much to write a book on those countries, if for nothing else, to make grateful mention of the many dear friends, whose benevolent actions toward me are ineffaceably stamped upon my memory, and warmly treasured in my heart. To these friends I owe my freedom in the United States. On their own motion, without any solicitation from me (Mrs. Henry Richardson, a clever lady, remarkable for her devotion to every good work, taking the lead), they raised a fund sufficient to purchase my freedom, and actually paid it over, and placed the papers 8 of my manumission in my hands, before they would tolerate the idea of my returning to this, my native country. To this commercial transaction I owe my exemption from the democratic operation of the Fugitive Slave Bill of 1850. But for this, I might at any time become a victim of this most cruel and scandalous enactment, and be doomed to end my life, as I began it, a slave. The sum paid for my freedom was one hundred and fifty pounds sterling.

Some of my uncompromising anti-slavery friends in this country failed to see the wisdom of this arrangement, and were not pleased that I consented to it, even by my silence. They thought it a violation of anti-slavery principles—conceding a right of property in man—and a wasteful expenditure of money. On the other hand, viewing it simply in the light of a ransom, or as money extorted by a robber, and my liberty of more value than one hundred and fifty pounds sterling, I could not see either a violation of the laws of morality, or those of economy, in the transaction.

It is true, I was not in the possession of my claimants, and could have easily remained in England, for the same friends who had so generously purchased my freedom, would have assisted me in establishing myself in that country. To this, however, I could not consent. I felt that I had a duty to perform—and that was, to labor and suffer with the oppressed in my native land. Considering, therefore, all the circumstances—the fugitive slave bill included—I think the very best thing was done in letting Master Hugh have the hundred and fifty pounds sterling, and leaving me free to return to my appropriate field of labor. Had I been a private person, having no other relations or duties than those of a personal and family nature, I should never have consented to the payment of so large a sum for the privilege of living securely under our glorious republican form of government. I could have remained in England, or have gone to some other country; and perhaps I could even have lived unobserved in this. But to this I could not consent. I had already become somewhat notorious, and withal quite as unpopular as notorious; and I was, therefore, much exposed to arrest and recapture.

The main object to which my labors in Great Britain were directed, was the concentration of the moral and religious sentiment of its people against American slavery. England is often charged with having established slavery in the United States, and if there were

no other justification than this, for appealing to her people to lend their moral aid for the abolition of slavery, I should be justified. My speeches in Great Britain were wholly extemporaneous, and I may not always have been so guarded in my expressions, as I otherwise should have been. I was ten years younger then than now, and only seven years from slavery. I cannot give the reader a better idea of the nature of my discourses, than by republishing one of them, delivered in Finsbury chapel, London, to an audience of about two thousand persons, and which was published in the _London Universe_, at the time. 9

Those in the United States who may regard this speech as being harsh in its spirit and unjust in its statements, because delivered before an audience supposed to be anti-republican in their principles and feelings, may view the matter differently, when they learn that the case supposed did not exist. It so happened that the great mass of the people in England who attended and patronized my anti-slavery meetings, were, in truth, about as good republicans as the mass of Americans, and with this decided advantage over the latter—they are lovers of republicanism for all men, for black men as well as for white men. They are the people who sympathize with Louis Kossuth and Mazzini, and with the oppressed and enslaved, of every color and nation, the world over. They constitute the democratic element in British politics, and are as much opposed to the union of church and state as we, in America, are to such an union. At the meeting where this speech was delivered, Joseph Sturge—a world-wide philanthropist, and a member of the society of Friends—presided, and addressed the meeting. George William Alexander, another Friend, who has spent more than an Ameriacn(sic) fortune in promoting the anti-slavery cause in different sections of the world, was on the platform; and also Dr. Campbell (now of the _British Banner_) who combines all the humane tenderness of Melanchthon, with the directness and boldness of Luther. He is in the very front ranks of non-conformists, and looks with no unfriendly eye upon America. George Thompson, too, was there; and America will yet own that he did a true man's work in relighting the rapidly dying-out fire of true republicanism in the American heart, and be ashamed of the treatment he met at her hands. Coming generations in this country will applaud the spirit of this much abused republican friend of freedom. There were others of note seated on the platform, who would gladly ingraft upon English institutions all that is purely republican in the institutions of America. Nothing, therefore, must be set down against this speech on the score that it was delivered in the presence of those who cannot appreciate the many excellent things belonging to our system of government, and with a view to stir up prejudice against republican institutions.

Again, let it also be remembered—for it is the simple truth—that neither in this speech, nor in any other which I delivered in England, did I ever allow myself to address Englishmen as against Americans. I took my stand on the high ground of human brotherhood, and spoke to Englishmen as men, in behalf of men. Slavery is a crime, not against Englishmen, but against God, and all the members of the human family; and it belongs to the whole human family to seek its suppression. In a letter to Mr. Greeley, of the New York Tribune, written while abroad, I said:

I am, nevertheless aware that the wisdom of exposing the sins of one nation in the ear of another, has been seriously questioned by good and clear-sighted people, both on this and on your side of the Atlantic. And the thought is not without weight on my own mind. I am satisfied that there are many evils which can be best removed by confining our efforts to the immediate locality where such evils exist. This, however, is by no means the case with the system of slavery. It is such a giant sin—such a monstrous aggregation of iniquity—so hardening to the human heart—so destructive to the moral sense, and so well calculated to beget a character, in every one around it, favorable to its own continuance,—that I feel not only at liberty, but abundantly justified, in appealing to the whole world to aid in its removal.

But, even if I had—as has been often charged—labored to bring American institutions generally into disrepute, and had not confined my labors strictly within the limits of humanity and morality, I should not have been without illustrious examples to support me. Driven into semi-exile by civil and barbarous laws, and by a system which cannot be thought of without a shudder, I was fully justified in turning, if possible, the tide of the moral universe against the heaven-daring outrage.

Four circumstances greatly assisted me in getting the question of American slavery before the British public. First, the mob on board the "Cambria," already referred to, which was a sort of national announcement of my arrival in England. Secondly, the highly reprehensible course pursued by the Free Church of Scotland, in soliciting, receiving, and retaining money in its sustentation fund for supporting the gospel in Scotland, which was evidently the ill-gotten gain of slaveholders and slave-traders. Third, the great Evangelical Alliance—or rather the attempt to form such an alliance, which should include slaveholders of a certain description—added immensely to the interest felt in the slavery question. About the same time, there was the World's Temperance Convention, where I had the misfortune to come in collision with sundry American doctors of divinity—Dr. Cox among the number—with whom I had a small controversy.

It has happened to me—as it has happened to most other men engaged in a good cause—often to be more indebted to my enemies than to my own skill or to the assistance of my friends, for whatever success has attended my labors. Great surprise was expressed by American newspapers, north and south, during my stay in Great Britain, that a person so illiterate and insignificant as myself could awaken an interest so marked in England. These papers were not the only parties surprised. I was myself not far behind them in surprise. But the very contempt and scorn, the systematic and extravagant disparagement of which I was the object, served, perhaps, to magnify my few merits, and to render me of some account, whether deserving or not. A man is sometimes made great, by the greatness of the abuse a portion of mankind may think proper to heap upon him. Whether I was of as much consequence as the English papers made me out to be, or not, it was easily seen, in England, that I could not be the ignorant and worthless creature, some of the American papers would have them believe I was. Men, in their senses, do not take bowie-knives to kill mosquitoes, nor pistols to shoot flies; and the American passengers who thought proper to get up a mob to silence me, on board the “Cambria,” took the most effective method of telling the British public that I had something to say.

But to the second circumstance, namely, the position of the Free Church of Scotland, with the great Doctors Chalmers, Cunningham, and Candlish at its head. That church, with its leaders, put it out of the power of the Scotch people to ask the old question, which we in the north have often most wickedly asked—“_What have we to do with slavery_?” That church had taken the price of blood into its treasury, with which to build _free_ churches, and to pay _free_ church ministers for preaching the gospel; and, worse still, when honest John Murray, of Bowlien Bay—now gone to his reward in heaven—with William Smeal, Andrew Paton, Frederick Card, and other sterling anti-slavery men in Glasgow, denounced the transaction as disgraceful and shocking to the religious sentiment of Scotland, this church, through its leading divines, instead of repenting and seeking to mend the mistake into which it had fallen, made it a flagrant sin, by undertaking to defend, in the name of God and the bible, the principle not only of taking the money of slave-dealers to build churches, but of holding fellowship with the holders and traffickers in human flesh. This, the reader will see, brought up the whole question of slavery, and opened the way to its full discussion, without any agency of mine. I have never seen a people more deeply moved than were the people of Scotland, on this very question. Public meeting succeeded public meeting. Speech after speech, pamphlet after pamphlet, editorial after editorial, sermon after sermon, soon lashed the conscientious Scotch people into a perfect _furore_. “SEND BACK THE MONEY!” was indignantly cried out, from Greenock to Edinburgh, and from Edinburgh to Aberdeen. George Thompson, of London, Henry C. Wright, of the United States, James N. Buffum, of Lynn, Massachusetts, and myself were on the anti-slavery side; and Doctors Chalmers, Cunningham, and Candlish on the other. In a conflict where the latter could have had even the show of right, the truth, in our hands as against them, must have been driven to the wall; and while I believe we were able to carry the conscience of the country against the action of the Free Church, the battle, it must be confessed, was a hard-fought one. Abler defenders of the doctrine of fellowshiping slaveholders as christians, have not been met with. In defending this doctrine, it was necessary to deny that slavery is a sin. If driven from this position, they were compelled to deny that slaveholders were responsible for the sin; and if driven from both these positions, they must deny that it is a sin in such a sense, and that slaveholders are sinners in such a sense, as to make it wrong, in the circumstances in which they were placed, to recognize them as Christians. Dr. Cunningham was the most powerful debater on the slavery side of the question; Mr. Thompson was the ablest on the anti-slavery side. A scene occurred between these two men, a parallel to which I think I never witnessed before, and I know I never have since. The scene was caused by a single exclamation on the part of Mr. Thompson.

The general assembly of the Free Church was in progress at Cannon Mills, Edinburgh. The building would hold about twenty-five hundred persons; and on this occasion it was densely packed, notice having been given that Doctors Cunningham and Candlish would speak, that day, in defense of the relations of the Free Church of Scotland to slavery in America. Messrs. Thompson, Buffum, myself, and a few anti-slavery friends, attended, but sat at such a distance, and in such a position, that, perhaps we were not observed from the platform. The excitement was intense, having been greatly increased by a series of meetings held by Messrs. Thompson, Wright, Buffum, and myself, in the most splendid hall in that most beautiful city, just previous to the meetings of the general assembly. “SEND BACK THE MONEY!” stared at us from every street corner; “SEND BACK THE MONEY!” in large capitals, adorned the broad flags of the pavement; “SEND BACK THE MONEY!” was the chorus of the popular street songs; “SEND BACK THE MONEY!” was the heading of leading editorials in the daily newspapers. This day, at Cannon Mills, the great doctors of the church were to give an answer to this loud and stern demand. Men of all parties and all sects were most eager to hear. Something great was expected. The occasion was great, the men great, and great speeches were expected from them.

In addition to the outside pressure upon Doctors Cunningham and Candlish, there was wavering in their own ranks. The conscience of the church itself was not at ease. A dissatisfaction with the position of the church touching slavery, was sensibly manifest among the members, and something must be done to counteract this untoward influence. The great Dr. Chalmers was in

feeble health, at the time. His most potent eloquence could not now be summoned to Cannon Mills, as formerly. He whose voice was able to rend asunder and dash down the granite walls of the established church of Scotland, and to lead a host in solemn procession from it, as from a doomed city, was now old and enfeebled. Besides, he had said his word on this very question; and his word had not silenced the clamor without, nor stilled the anxious heavings within. The occasion was momentous, and felt to be so. The church was in a perilous condition. A change of some sort must take place in her condition, or she must go to pieces. To stand where she did, was impossible. The whole weight of the matter fell on Cunningham and Candlish. No shoulders in the church were broader than theirs; and I must say, badly as I detest the principles laid down and defended by them, I was compelled to acknowledge the vast mental endowments of the men. Cunningham rose; and his rising was the signal for almost tumultous applause. You will say this was scarcely in keeping with the solemnity of the occasion, but to me it served to increase its grandeur and gravity. The applause, though tumultuous, was not joyous. It seemed to me, as it thundered up from the vast audience, like the fall of an immense shaft, flung from shoulders already galled by its crushing weight. It was like saying, “Doctor, we have borne this burden long enough, and willingly fling it upon you. Since it was you who brought it upon us, take it now, and do what you will with it, for we are too weary to bear it. [“no close”].

Doctor Cunningham proceeded with his speech, abounding in logic, learning, and eloquence, and apparently bearing down all opposition; but at the moment—the fatal moment—when he was just bringing all his arguments to a point, and that point being, that neither Jesus Christ nor his holy apostles regarded slaveholding as a sin, George Thompson, in a clear, sonorous, but rebuking voice, broke the deep stillness of the audience, exclaiming, HEAR! HEAR! HEAR! The effect of this simple and common exclamation is almost incredible. It was as if a granite wall had been suddenly flung up against the advancing current of a mighty river. For a moment, speaker and audience were brought to a dead silence. Both the doctor and his hearers seemed appalled by the audacity, as well as the fitness of the rebuke. At length a shout went up to the cry of “_Put him out_!” Happily, no one attempted to execute this cowardly order, and the doctor proceeded with his discourse. Not, however, as before, did the learned doctor proceed. The exclamation of Thompson must have reechoed itself a thousand times in his memory, during the remainder of his speech, for the doctor never recovered from the blow.

The deed was done, however; the pillars of the church—_the proud, Free Church of Scotland_—were committed and the humility of repentance was absent. The Free Church held on to the blood-stained money, and continued to justify itself in its position—and of course to apologize for slavery—and does so till this day. She lost a glorious opportunity for giving her voice, her vote, and her example to the cause of humanity; and to-day she is staggering under the curse of the enslaved, whose blood is in her skirts. The people of Scotland are, to this day, deeply grieved at the course pursued by the Free Church, and would hail, as a relief from a deep and blighting shame, the “sending back the money” to the slaveholders from whom it was gathered.

One good result followed the conduct of the Free Church; it furnished an occasion for making the people of Scotland thoroughly acquainted with the character of slavery, and for arraying against the system the moral and religious sentiment of that country. Therefore, while we did not succeed in accomplishing the specific object of our mission, namely—procure the sending back of the money—we were amply justified by the good which really did result from our labors.

Next comes the Evangelical Alliance. This was an attempt to form a union of all evangelical Christians throughout the world. Sixty or seventy American divines attended, and some of them went there merely to weave a world-wide garment with which to clothe evangelical slaveholders. Foremost among these divines, was the Rev. Samuel Hanson Cox, moderator of the New School Presbyterian General Assembly. He and his friends spared no pains to secure a platform broad enough to hold American slaveholders, and in this partly succeeded. But the question of slavery is too large a question to be finally disposed of, even by the Evangelical Alliance. We appealed from the judgment of the Alliance, to the judgment of the people of Great Britain, and with the happiest effect. This controversy with the Alliance might be made the subject of extended remark, but I must forbear, except to say, that this effort to shield the Christian character of slaveholders greatly served to open a way to the British ear for anti-slavery discussion, and that it was well improved.

The fourth and last circumstance that assisted me in getting before the British public, was an attempt on the part of certain doctors of divinity to silence me on the platform of the World’s Temperance Convention. Here I was brought into point blank collison with Rev. Dr. Cox, who made me the subject not only of bitter remark in the convention, but also of a long denunciatory letter published in the New York Evangelist and other American papers. I replied to the doctor as well as I could, and was successful in getting a respectful hearing before the British public, who are by nature and practice ardent lovers of fair play, especially in a conflict between the weak and the strong.

Thus did circumstances favor me, and favor the cause of which I strove to be the advocate. After such distinguished notice, the public in both countries was compelled to attach some importance to my labors. By the very ill usage I received at the hands of Dr. Cox and his party, by the mob on board the “Cambria,” by the attacks made upon me in the American newspapers, and by the aspersions cast upon me through the organs of the Free Church of Scotland, I became one of that class of men, who, for the moment, at least, “have greatness forced upon them.” People became the more anxious to hear for themselves, and to judge for themselves, of the truth which I had to unfold. While, therefore, it is by no means easy for a stranger to get fairly before the British public, it was my lot to accomplish it in the easiest manner possible.

Having continued in Great Britain and Ireland nearly two years, and being about to return to America—not as I left it, a slave, but a freeman—leading friends of the cause of emancipation in that country intimated their intention to make me a testimonial, not only on grounds of personal regard to myself, but also to the cause to which they were so ardently devoted. How far any such thing could have succeeded, I do not know; but many reasons led me to prefer that my friends should simply give me the means of obtaining a printing press and printing materials, to enable me to start a paper, devoted to the interests of my enslaved and oppressed people. I told them that perhaps the greatest hinderance to the adoption of abolition principles by the people of the United States, was the low estimate, everywhere in that country, placed upon the Negro, as a man; that because of his assumed natural inferiority, people reconciled themselves to his enslavement and oppression, as things inevitable, if not desirable. The grand thing to be done, therefore, was to change the estimation in which the colored people of the United States were held; to remove the prejudice which depreciated and depressed them; to prove them worthy of a higher consideration; to disprove their alleged inferiority, and demonstrate their capacity for a more exalted civilization than slavery and prejudice had assigned to them. I further stated, that, in my judgment, a tolerably well conducted press, in the hands of persons of the despised race, by calling out the mental energies of the race itself; by making them acquainted with their own latent powers; by enkindling among them the hope that for them there is a future; by developing their moral power; by combining and reflecting their talents—would prove a most powerful means of removing prejudice, and of awakening an interest in them. I further informed them—and at that time the statement was true—that there was not, in the United States, a single newspaper regularly published by the colored people; that many attempts had been made to establish such papers; but that, up to that time, they had all failed. These views I laid before my friends. The result was, nearly two thousand five hundred dollars were speedily raised toward starting my paper. For this prompt and generous assistance, rendered upon my bare suggestion, without any personal efforts on my part, I shall never cease to feel deeply grateful; and the thought of fulfilling the noble expectations of the dear friends who gave me this evidence of their confidence, will never cease to be a motive for persevering exertion.

Proposing to leave England, and turning my face toward America, in the spring of 1847, I was met, on the threshold, with something which painfully reminded me of the kind of life which awaited me in my native land. For the first time in the many months spent abroad, I was met with proscription on account of my color. A few weeks before departing from England, while in London, I was careful to purchase a ticket, and secure a berth for returning home, in the “Cambria”—the steamer in which I left the United States—paying therefor the round sum of forty pounds and nineteen shillings sterling. This was first cabin fare. But on going aboard the Cambria, I found that the Liverpool agent had ordered my berth to be given to another, and had forbidden my entering the saloon! This contemptible conduct met with stern rebuke from the British press. For, upon the point of leaving England, I took occasion to expose the disgusting tyranny, in the columns of the London _Times_. That journal, and other leading journals throughout the United Kingdom, held up the outrage to unmitigated condemnation. So good an opportunity for calling out a full expression of British sentiment on the subject, had not before occurred, and it was most fully embraced. The result was, that Mr. Cunard came out in a letter to the public journals, assuring them of his regret at the outrage, and promising that the like should never occur again on board his steamers; and the like, we believe, has never since occurred on board the steamships of the Cunard line.

It is not very pleasant to be made the subject of such insults; but if all such necessarily resulted as this one did, I should be very happy to bear, patiently, many more than I have borne, of the same sort. Albeit, the lash of proscription, to a man accustomed to equal social position, even for a time, as I was, has a sting for the soul hardly less severe than that which bites the flesh and draws the blood from the back of the plantation slave. It was rather hard, after having enjoyed nearly two years of equal social privileges in England, often dining with gentlemen of great literary, social, political, and religious eminence never, during the whole time, having met with a single word, look, or gesture, which gave me the slightest reason to think my color was an offense to anybody—now to be cooped up in the stern of the “Cambria,” and denied the right to enter the saloon, lest my dark presence should be deemed an offense to some of my democratic fellow-passengers. The reader will easily imagine what must have been my feelings.

CHAPTER XXV. _Various Incidents_

NEWSPAPER ENTERPRISE—UNEXPECTED OPPOSITION—THE OBJECTIONS TO IT—THEIR PLAUSIBILITY ADMITTED—MOTIVES FOR COMING TO ROCHESTER—DISCIPLE OF MR. GARRISON—CHANGE OF OPINION—CAUSES LEADING TO IT—THE CONSEQUENCES OF THE CHANGE—PREJUDICE AGAINST COLOR—AMUSING CONDESCENSION—“JIM CROW CARS”—COLLISIONS WITH CONDUCTORS AND BRAKEMEN—TRAINS ORDERED NOT TO STOP AT LYNN—AMUSING DOMESTIC SCENE—SEPARATE TABLES FOR MASTER AND MAN—PREJUDICE UNNATURAL—ILLUSTRATIONS—IN HIGH COMPANY—ELEVATION OF THE FREE PEOPLE OF COLOR—PLEDGE FOR THE FUTURE.

I have now given the reader an imperfect sketch of nine years’ experience in freedom—three years as a common laborer on the wharves of New Bedford, four years as a lecturer in New England, and two years of semi-exile in Great Britain and Ireland. A single ray of light remains to be flung upon my life during the last eight years, and my story will be done.

A trial awaited me on my return from England to the United States, for which I was but very imperfectly prepared. My plans for my then future usefulness as an anti-slavery advocate were all settled. My friends in England had resolved to raise a given sum to purchase for me a press and printing materials; and I already saw myself wielding my pen, as well as my voice, in the great work of renovating the public mind, and building up a public sentiment which should, at least, send slavery and oppression to the grave, and restore to “liberty and the pursuit of happiness” the people with whom I had suffered, both as a slave and as a freeman. Intimation had reached my friends in Boston of what I intended to do, before my arrival, and I was prepared to find them favorably disposed toward my much cherished enterprise. In this I was mistaken. I found them very earnestly opposed to the idea of my starting a paper, and for several reasons. First, the paper was not needed; secondly, it would interfere with my usefulness as a lecturer; thirdly, I was better fitted to speak than to write; fourthly, the paper could not succeed. This opposition, from a quarter so highly esteemed, and to which I had been accustomed to look for advice and direction, caused me not only to hesitate, but inclined me to abandon the enterprise. All previous attempts to establish such a journal having failed, I felt that probably I should but add another to the list of failures, and thus contribute another proof of the mental and moral deficiencies of my race. Very much that was said to me in respect to my imperfect literary acquirements, I felt to be most painfully true. The unsuccessful projectors of all the previous colored newspapers were my superiors in point of education, and if they failed, how could I hope for success? Yet I did hope for success, and persisted in the undertaking. Some of my English friends greatly encouraged me to go forward, and I shall never cease to be grateful for their words of cheer and generous deeds.

I can easily pardon those who have denounced me as ambitious and presumptuous, in view of my persistence in this enterprise. I was but nine years from slavery. In point of mental experience, I was but nine years old. That one, in such circumstances, should aspire to establish a printing press, among an educated people, might well be considered, if not ambitious, quite silly. My American friends looked at me with astonishment! “A wood-sawyer” offering himself to the public as an editor! A slave, brought up in the very depths of ignorance, assuming to instruct the highly civilized people of the north in the principles of liberty, justice, and humanity! The thing looked absurd. Nevertheless, I persevered. I felt that the want of education, great as it was, could be overcome by study, and that knowledge would come by experience; and further (which was perhaps the most controlling consideration). I thought that an intelligent public, knowing my early history, would easily pardon a large share of the deficiencies which I was sure that my paper would exhibit. The most distressing thing, however, was the offense which I was about to give my Boston friends, by what seemed to them a reckless disregard of their sage advice. I am not sure that I was not under the influence of something like a slavish adoration of my Boston friends, and I labored hard to convince them of the wisdom of my undertaking, but without success. Indeed, I never expect to succeed, although time has answered all their original objections. The paper has been successful. It is a large sheet, costing eighty dollars per week—has three thousand subscribers—has been published regularly nearly eight years—and bids fair to stand eight years longer. At any rate, the eight years to come are as full of promise as were the eight that are past.

It is not to be concealed, however, that the maintenance of such a journal, under the circumstances, has been a work of much difficulty; and could all the perplexity, anxiety, and trouble attending it, have been clearly foreseen, I might have shrunk from the undertaking. As it is, I rejoice in having engaged in the enterprise, and count it joy to have been able to suffer, in many ways, for its success, and for the success of the cause to which it has been faithfully devoted. I look upon the time, money, and labor bestowed upon it, as being amply rewarded, in the development of my own mental and moral energies, and in the corresponding development of my deeply injured and oppressed people.

From motives of peace, instead of issuing my paper in Boston, among my New England friends, I came to Rochester, western New York, among strangers, where the circulation of my paper could not interfere with the local circulation of the _Liberator_ and the _Standard;_ for at that time I was, on the anti-slavery question, a faithful disciple of William Lloyd Garrison, and fully committed to his doctrine touching the pro-slavery character of the constitution of the United States, and the _non-voting principle_, of which he is the known and distinguished advocate. With Mr. Garrison, I held it to be the first duty of the non-slaveholding states to dissolve the union with the slaveholding states; and hence my cry, like his, was, “No union with slaveholders.” With these views, I came into western New York; and during the first four years of my labor here, I advocated them with pen and tongue, according to the best of my ability.

About four years ago, upon a reconsideration of the whole subject, I became convinced that there was no necessity for dissolving the “union between the northern and southern states;” that to seek this dissolution was no part of my duty as an abolitionist; that to abstain from voting, was to refuse to exercise a legitimate and powerful means for abolishing slavery; and that the constitution of the United States not only contained no guarantees in favor of slavery, but, on the contrary, it is, in its letter and spirit, an anti-slavery instrument, demanding the abolition of slavery as a condition of its own existence, as the supreme law of the land.

Here was a radical change in my opinions, and in the action logically resulting from that change. To those with whom I had been in agreement and in sympathy, I was now in opposition. What they held to be a great and important truth, I now looked upon as a dangerous error. A very painful, and yet a very natural, thing now happened. Those who could not see any honest reasons for changing their views, as I had done, could not easily see any such reasons for my change, and the common punishment of apostates was mine.

The opinions first entertained were naturally derived and honestly entertained, and I trust that my present opinions have the same claims to respect. Brought directly, when I escaped from slavery, into contact with a class of abolitionists regarding the constitution as a slaveholding instrument, and finding their views supported by the united and entire history of every department of the government, it is not strange that I assumed the constitution to be just what their interpretation made it. I was bound, not only by their superior knowledge, to take their opinions as the true ones, in respect to the subject, but also because I had no means of showing their unsoundness. But for the responsibility of conducting a public journal, and the necessity imposed upon me of meeting opposite views from abolitionists in this state, I should in all probability have remained as firm in my disunion views as any other disciple of William Lloyd Garrison.

My new circumstances compelled me to re-think the whole subject, and to study, with some care, not only the just and proper rules of legal interpretation, but the origin, design, nature, rights, powers, and duties of civil government, and also the relations which human beings sustain to it. By such a course of thought and reading, I was conducted to the conclusion that the constitution of the United States—inaugurated “to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessing of liberty”—could not well have been designed at the same time to maintain and perpetuate a system of rapine and murder, like slavery; especially, as not one word can be found in the constitution to authorize such a belief. Then, again, if the declared purposes of an instrument are to govern the meaning of all its parts and details, as they clearly should, the constitution of our country is our warrant for the abolition of slavery in every state in the American Union. I mean, however, not to argue, but simply to state my views. It would require very many pages of a volume like this, to set forth the arguments demonstrating the unconstitutionality and the complete illegality of slavery in our land; and as my experience, and not my arguments, is within the scope and contemplation of this volume, I omit the latter and proceed with the former.

I will now ask the kind reader to go back a little in my story, while I bring up a thread left behind for convenience sake, but which, small as it is, cannot be properly omitted altogether; and that thread is American prejudice against color, and its varied illustrations in my own experience.

When I first went among the abolitionists of New England, and began to travel, I found this prejudice very strong and very annoying. The abolitionists themselves were not entirely free from it, and I could see that they were nobly struggling against it. In their eagerness, sometimes, to show their contempt for the feeling, they proved that they had not entirely recovered from it; often illustrating the saying, in their conduct, that a man may “stand up so straight as to lean backward.” When it was said to me, “Mr. Douglass, I will walk to meeting with you; I am not afraid of a black man,” I could not help thinking—seeing nothing very frightful in my appearance—“And why should you be?” The children at the north had all been educated to believe that if they were bad, the old _black_ man—not the old _devil_—would get them; and it was evidence of some courage, for any so educated to get the better of their fears.

The custom of providing separate cars for the accommodation of colored travelers, was established on nearly all the railroads of New England, a dozen years ago. Regarding this custom as fostering the spirit of caste, I made it a rule to seat myself in the cars for the accommodation of passengers generally. Thus seated, I was sure to be called upon to betake myself to the "_Jim Crow car_." Refusing to obey, I was often dragged out of my seat, beaten, and severely bruised, by conductors and brakemen. Attempting to start from Lynn, one day, for Newburyport, on the Eastern railroad, I went, as my custom was, into one of the best railroad carriages on the road. The seats were very luxuriant and beautiful. I was soon waited upon by the conductor, and ordered out; whereupon I demanded the reason for my invidious removal. After a good deal of parleying, I was told that it was because I was black. This I denied, and appealed to the company to sustain my denial; but they were evidently unwilling to commit themselves, on a point so delicate, and requiring such nice powers of discrimination, for they remained as dumb as death. I was soon waited on by half a dozen fellows of the baser sort (just such as would volunteer to take a bull-dog out of a meeting-house in time of public worship), and told that I must move out of that seat, and if I did not, they would drag me out. I refused to move, and they clutched me, head, neck, and shoulders. But, in anticipation of the stretching to which I was about to be subjected, I had interwoven myself among the seats. In dragging me out, on this occasion, it must have cost the company twenty-five or thirty dollars, for I tore up seats and all. So great was the excitement in Lynn, on the subject, that the superintendent, Mr. Stephen A. Chase, ordered the trains to run through Lynn without stopping, while I remained in that town; and this ridiculous farce was enacted. For several days the trains went dashing through Lynn without stopping. At the same time that they excluded a free colored man from their cars, this same company allowed slaves, in company with their masters and mistresses, to ride unmolested.

After many battles with the railroad conductors, and being roughly handled in not a few instances, proscription was at last abandoned; and the "Jim Crow car"—set up for the degradation of colored people—is nowhere found in New England. This result was not brought about without the intervention of the people, and the threatened enactment of a law compelling railroad companies to respect the rights of travelers. Hon. Charles Francis Adams performed signal service in the Massachusetts legislature, in bringing this reformation; and to him the colored citizens of that state are deeply indebted.

Although often annoyed, and sometimes outraged, by this prejudice against color, I am indebted to it for many passages of quiet amusement. A half-cured subject of it is sometimes driven into awkward straits, especially if he happens to get a genuine specimen of the race into his house.

In the summer of 1843, I was traveling and lecturing, in company with William A. White, Esq., through the state of Indiana. Anti-slavery friends were not very abundant in Indiana, at that time, and beds were not more plentiful than friends. We often slept out, in preference to sleeping in the houses, at some points. At the close of one of our meetings, we were invited home with a kindly-disposed old farmer, who, in the generous enthusiasm of the moment, seemed to have forgotten that he had but one spare bed, and that his guests were an ill-matched pair. All went on pretty well, till near bed time, when signs of uneasiness began to show themselves, among the unsophisticated sons and daughters. White is remarkably fine looking, and very evidently a born gentleman; the idea of putting us in the same bed was hardly to be tolerated; and yet, there we were, and but the one bed for us, and that, by the way, was in the same room occupied by the other members of the family. White, as well as I, perceived the difficulty, for yonder slept the old folks, there the sons, and a little farther along slept the daughters; and but one other bed remained. Who should have this bed, was the puzzling question. There was some whispering between the old folks, some confused looks among the young, as the time for going to bed approached. After witnessing the confusion as long as I liked, I relieved the kindly-disposed family by playfully saying, "Friend White, having got entirely rid of my prejudice against color, I think, as a proof of it, I must allow you to sleep with me to-night." White kept up the joke, by seeming to esteem himself the favored party, and thus the difficulty was removed. If we went to a hotel, and called for dinner, the landlord was sure to set one table for White and another for me, always taking him to be master, and me the servant. Large eyes were generally made when the order was given to remove the dishes from my table to that of White's. In those days, it was thought strange that a white man and a colored man could dine peaceably at the same table, and in some parts the strangeness of such a sight has not entirely subsided.

Some people will have it that there is a natural, an inherent, and an invincible repugnance in the breast of the white race toward dark-colored people; and some very intelligent colored men think that their proscription is owing solely to the color which nature has given them. They hold that they are rated according to their color, and that it is impossible for white people ever to look upon dark races of men, or men belonging to the African race, with other than feelings of aversion. My experience, both serious and mirthful, combats this conclusion. Leaving out of sight, for a moment, grave facts, to this point, I will state one or two, which illustrate a very interesting feature of American character as well as American prejudice. Riding from Boston to Albany, a few years ago, I found myself in a large car, well filled with passengers. The seat next to me was about the only vacant one. At every stopping place we

took in new passengers, all of whom, on reaching the seat next to me, cast a disdainful glance upon it, and passed to another car, leaving me in the full enjoyment of a hole form. For a time, I did not know but that my riding there was prejudicial to the interest of the railroad company. A circumstance occurred, however, which gave me an elevated position at once. Among the passengers on this train was Gov. George N. Briggs. I was not acquainted with him, and had no idea that I was known to him, however, I was, for upon observing me, the governor left his place, and making his way toward me, respectfully asked the privilege of a seat by my side; and upon introducing himself, we entered into a conversation very pleasant and instructive to me. The despised seat now became honored. His excellency had removed all the prejudice against sitting by the side of a Negro; and upon his leaving it, as he did, on reaching Pittsfield, there were at least one dozen applicants for the place. The governor had, without changing my skin a single shade, made the place respectable which before was despicable.

A similar incident happened to me once on the Boston and New Bedford railroad, and the leading party to it has since been governor of the state of Massachusetts. I allude to Col. John Henry Clifford. Lest the reader may fancy I am aiming to elevate myself, by claiming too much intimacy with great men, I must state that my only acquaintance with Col. Clifford was formed while I was _his hired servant_, during the first winter of my escape from slavery. I owe it him to say, that in that relation I found him always kind and gentlemanly. But to the incident. I entered a car at Boston, for New Bedford, which, with the exception of a single seat was full, and found I must occupy this, or stand up, during the journey. Having no mind to do this, I stepped up to the man having the next seat, and who had a few parcels on the seat, and gently asked leave to take a seat by his side. My fellow-passenger gave me a look made up of reproach and indignation, and asked me why I should come to that particular seat. I assured him, in the gentlest manner, that of all others this was the seat for me. Finding that I was actually about to sit down, he sang out, “O! stop, stop! and let me get out!” Suiting the action to the word, up the agitated man got, and sauntered to the other end of the car, and was compelled to stand for most of the way thereafter. Halfway to New Bedford, or more, Col. Clifford, recognizing me, left his seat, and not having seen me before since I had ceased to wait on him (in everything except hard arguments against his pro-slavery position), apparently forgetful of his rank, manifested, in greeting me, something of the feeling of an old friend. This demonstration was not lost on the gentleman whose dignity I had, an hour before, most seriously offended. Col. Clifford was known to be about the most aristocratic gentleman in Bristol county; and it was evidently thought that I must be somebody, else I should not have been thus noticed, by a person so distinguished. Sure enough, after Col. Clifford left me, I found myself surrounded with friends; and among the number, my offended friend stood nearest, and with an apology for his rudeness, which I could not resist, although it was one of the lamest ever offered. With such facts as these before me—and I have many of them—I am inclined to think that pride and fashion have much to do with the treatment commonly extended to colored people in the United States. I once heard a very plain man say (and he was cross-eyed, and awkwardly flung together in other respects) that he should be a handsome man when public opinion shall be changed.

Since I have been editing and publishing a journal devoted to the cause of liberty and progress, I have had my mind more directed to the condition and circumstances of the free colored people than when I was the agent of an abolition society. The result has been a corresponding change in the disposition of my time and labors. I have felt it to be a part of my mission—under a gracious Providence to impress my sable brothers in this country with the conviction that, notwithstanding the ten thousand discouragements and the powerful hinderances, which beset their existence in this country—notwithstanding the blood-written history of Africa, and her children, from whom we have descended, or the clouds and darkness (whose stillness and gloom are made only more awful by wrathful thunder and lightning) now overshadowing them—progress is yet possible, and bright skies shall yet shine upon their pathway; and that “Ethiopia shall yet reach forth her hand unto God.”

Believing that one of the best means of emancipating the slaves of the south is to improve and elevate the character of the free colored people of the north I shall labor in the future, as I have labored in the past, to promote the moral, social, religious, and intellectual elevation of the free colored people; never forgetting my own humble orgin(sic), nor refusing, while Heaven lends me ability, to use my voice, my pen, or my vote, to advocate the great and primary work of the universal and unconditional emancipation of my entire race.

RECEPTION SPEECH 10. At Finsbury Chapel, Moorfields, England, May 12,

1846

Mr. Douglass rose amid loud cheers, and said: I feel exceedingly glad of the opportunity now afforded me of presenting the claims of my brethren in bonds in the United States, to so many in London and from various parts of Britain, who have assembled here on

the present occasion. I have nothing to commend me to your consideration in the way of learning, nothing in the way of education, to entitle me to your attention; and you are aware that slavery is a very bad school for rearing teachers of morality and religion. Twenty-one years of my life have been spent in slavery—personal slavery—surrounded by degrading influences, such as can exist nowhere beyond the pale of slavery; and it will not be strange, if under such circumstances, I should betray, in what I have to say to you, a deficiency of that refinement which is seldom or ever found, except among persons that have experienced superior advantages to those which I have enjoyed. But I will take it for granted that you know something about the degrading influences of slavery, and that you will not expect great things from me this evening, but simply such facts as I may be able to advance immediately in connection with my own experience of slavery.

Now, what is this system of slavery? This is the subject of my lecture this evening—what is the character of this institution? I am about to answer the inquiry, what is American slavery? I do this the more readily, since I have found persons in this country who have identified the term slavery with that which I think it is not, and in some instances, I have feared, in so doing, have rather (unwittingly, I know) detracted much from the horror with which the term slavery is contemplated. It is common in this country to distinguish every bad thing by the name of slavery. Intemperance is slavery; to be deprived of the right to vote is slavery, says one; to have to work hard is slavery, says another; and I do not know but that if we should let them go on, they would say that to eat when we are hungry, to walk when we desire to have exercise, or to minister to our necessities, or have necessities at all, is slavery. I do not wish for a moment to detract from the horror with which the evil of intemperance is contemplated—not at all; nor do I wish to throw the slightest obstruction in the way of any political freedom that any class of persons in this country may desire to obtain. But I am here to say that I think the term slavery is sometimes abused by identifying it with that which it is not. Slavery in the United States is the granting of that power by which one man exercises and enforces a right of property in the body and soul of another. The condition of a slave is simply that of the brute beast. He is a piece of property—a marketable commodity, in the language of the law, to be bought or sold at the will and caprice of the master who claims him to be his property; he is spoken of, thought of, and treated as property. His own good, his conscience, his intellect, his affections, are all set aside by the master. The will and the wishes of the master are the law of the slave. He is as much a piece of property as a horse. If he is fed, he is fed because he is property. If he is clothed, it is with a view to the increase of his value as property. Whatever of comfort is necessary to him for his body or soul that is inconsistent with his being property, is carefully wrested from him, not only by public opinion, but by the law of the country. He is carefully deprived of everything that tends in the slightest degree to detract from his value as property. He is deprived of education. God has given him an intellect; the slaveholder declares it shall not be cultivated. If his moral perception leads him in a course contrary to his value as property, the slaveholder declares he shall not exercise it. The marriage institution cannot exist among slaves, and one-sixth of the population of democratic America is denied its privileges by the law of the land. What is to be thought of a nation boasting of its liberty, boasting of its humanity, boasting of its Christianity, boasting of its love of justice and purity, and yet having within its own borders three millions of persons denied by law the right of marriage?—what must be the condition of that people? I need not lift up the veil by giving you any experience of my own. Every one that can put two ideas together, must see the most fearful results from such a state of things as I have just mentioned. If any of these three millions find for themselves companions, and prove themselves honest, upright, virtuous persons to each other, yet in these cases—few as I am bound to confess they are—the virtuous live in constant apprehension of being torn asunder by the merciless men-stealers that claim them as their property. This is American slavery; no marriage—no education—the light of the gospel shut out from the dark mind of the bondman—and he forbidden by law to learn to read. If a mother shall teach her children to read, the law in Louisiana proclaims that she may be hanged by the neck. If the father attempt to give his son a knowledge of letters, he may be punished by the whip in one instance, and in another be killed, at the discretion of the court. Three millions of people shut out from the light of knowledge! It is easy for you to conceive the evil that must result from such a state of things.

I now come to the physical evils of slavery. I do not wish to dwell at length upon these, but it seems right to speak of them, not so much to influence your minds on this question, as to let the slaveholders of America know that the curtain which conceals their crimes is being lifted abroad; that we are opening the dark cell, and leading the people into the horrible recesses of what they are pleased to call their domestic institution. We want them to know that a knowledge of their whippings, their scourgings, their brandings, their chainings, is not confined to their plantations, but that some Negro of theirs has broken loose from his chains—has burst through the dark incrustation of slavery, and is now exposing their deeds of deep damnation to the gaze of the christian people of England.

The slaveholders resort to all kinds of cruelty. If I were disposed, I have matter enough to interest you on this question for five or six evenings, but I will not dwell at length upon these cruelties. Suffice it to say, that all of the peculiar modes of torture that were resorted to in the West India islands, are resorted to, I believe, even more frequently, in the United States of America. Starvation,

the bloody whip, the chain, the gag, the thumb-screw, cat-hauling, the cat-o'-nine-tails, the dungeon, the blood-hound, are all in requisition to keep the slave in his condition as a slave in the United States. If any one has a doubt upon this point, I would ask him to read the chapter on slavery in Dickens's _Notes on America_. If any man has a doubt upon it, I have here the "testimony of a thousand witnesses," which I can give at any length, all going to prove the truth of my statement. The blood-hound is regularly trained in the United States, and advertisements are to be found in the southern papers of the Union, from persons advertising themselves as blood-hound trainers, and offering to hunt down slaves at fifteen dollars a piece, recommending their hounds as the fleetest in the neighborhood, never known to fail. Advertisements are from time to time inserted, stating that slaves have escaped with iron collars about their necks, with bands of iron about their feet, marked with the lash, branded with red-hot irons, the initials of their master's name burned into their flesh; and the masters advertise the fact of their being thus branded with their own signature, thereby proving to the world, that, however damning it may appear to non-slavers, such practices are not regarded discreditable among the slaveholders themselves. Why, I believe if a man should brand his horse in this country—burn the initials of his name into any of his cattle, and publish the ferocious deed here—that the united execrations of Christians in Britain would descend upon him. Yet in the United States, human beings are thus branded. As Whittier says—

... Our countrymen in chains, The whip on woman's shrinking flesh, Our soil yet reddening with the stains Caught from her scourgings warm and fresh.

The slave-dealer boldly publishes his infamous acts to the world. Of all things that have been said of slavery to which exception has been taken by slaveholders, this, the charge of cruelty, stands foremost, and yet there is no charge capable of clearer demonstration, than that of the most barbarous inhumanity on the part of the slaveholders toward their slaves. And all this is necessary; it is necessary to resort to these cruelties, in order to _make the slave a slave_, and to _keep him a slave_. Why, my experience all goes to prove the truth of what you will call a marvelous proposition, that the better you treat a slave, the more you destroy his value _as a slave_, and enhance the probability of his eluding the grasp of the slaveholder; the more kindly you treat him, the more wretched you make him, while you keep him in the condition of a slave. My experience, I say, confirms the truth of this proposition. When I was treated exceedingly ill; when my back was being scourged daily; when I was whipped within an inch of my life—_life_ was all I cared for. "Spare my life," was my continual prayer. When I was looking for the blow about to be inflicted upon my head, I was not thinking of my liberty; it was my life. But, as soon as the blow was not to be feared, then came the longing for liberty. If a slave has a bad master, his ambition is to get a better; when he gets a better, he aspires to have the best; and when he gets the best, he aspires to be his own master. But the slave must be brutalized to keep him as a slave. The slaveholder feels this necessity. I admit this necessity. If it be right to hold slaves at all, it is right to hold them in the only way in which they can be held; and this can be done only by shutting out the light of education from their minds, and brutalizing their persons. The whip, the chain, the gag, the thumb-screw, the blood-hound, the stocks, and all the other bloody paraphernalia of the slave system, are indispensably necessary to the relation of master and slave. The slave must be subjected to these, or he ceases to be a slave. Let him know that the whip is burned; that the fetters have been turned to some useful and profitable employment; that the chain is no longer for his limbs; that the blood-hound is no longer to be put upon his track; that his master's authority over him is no longer to be enforced by taking his life—and immediately he walks out from the house of bondage and asserts his freedom as a man. The slaveholder finds it necessary to have these implements to keep the slave in bondage; finds it necessary to be able to say, "Unless you do so and so; unless you do as I bid you—I will take away your life!"

Some of the most awful scenes of cruelty are constantly taking place in the middle states of the Union. We have in those states what are called the slave-breeding states. Allow me to speak plainly. Although it is harrowing to your feelings, it is necessary that the facts of the case should be stated. We have in the United States slave-breeding states. The very state from which the minister from our court to yours comes, is one of these states—Maryland, where men, women, and children are reared for the market, just as horses, sheep, and swine are raised for the market. Slave-rearing is there looked upon as a legitimate trade; the law sanctions it, public opinion upholds it, the church does not condemn it. It goes on in all its bloody horrors, sustained by the auctioneer's block. If you would see the cruelties of this system, hear the following narrative. Not long since the following scene occurred. A slave-woman and a slaveman had united themselves as man and wife in the absence of any law to protect them as man and wife. They had lived together by the permission, not by right, of their master, and they had reared a family. The master found it expedient, and for his interest, to sell them. He did not ask them their wishes in regard to the matter at all; they were not consulted. The man and woman were brought to the auctioneer's block, under the sound of the hammer. The cry was raised, "Here goes; who bids cash?" Think of it—a man and wife to be sold! The woman was placed on the auctioneer's block; her limbs, as is customary, were brutally exposed to the purchasers, who examined her with all the freedom with which they would examine a horse. There

stood the husband, powerless; no right to his wife; the master's right preeminent. She was sold. He was next brought to the auctioneer's block. His eyes followed his wife in the distance; and he looked beseechingly, imploringly, to the man that had bought his wife, to buy him also. But he was at length bid off to another person. He was about to be separated forever from her he loved. No word of his, no work of his, could save him from this separation. He asked permission of his new master to go and take the hand of his wife at parting. It was denied him. In the agony of his soul he rushed from the man who had just bought him, that he might take a farewell of his wife; but his way was obstructed, he was struck over the head with a loaded whip, and was held for a moment; but his agony was too great. When he was let go, he fell a corpse at the feet of his master. His heart was broken. Such scenes are the everyday fruits of American slavery. Some two years since, the Hon. Seth. M. Gates, an anti-slavery gentleman of the state of New York, a representative in the congress of the United States, told me he saw with his own eyes the following circumstances. In the national District of Columbia, over which the star-spangled emblem is constantly waving, where orators are ever holding forth on the subject of American liberty, American democracy, American republicanism, there are two slave prisons. When going across a bridge, leading to one of these prisons, he saw a young woman run out, bare-footed and bare-headed, and with very little clothing on. She was running with all speed to the bridge he was approaching. His eye was fixed upon her, and he stopped to see what was the matter. He had not paused long before he saw three men run out after her. He now knew what the nature of the case was; a slave escaping from her chains—a young woman, a sister—escaping from the bondage in which she had been held. She made her way to the bridge, but had not reached, ere from the Virginia side there came two slaveholders. As soon as they saw them, her pursuers called out, "Stop her!" True to their Virginian instincts, they came to the rescue of their brother kidnappers, across the bridge. The poor girl now saw that there was no chance for her. It was a trying time. She knew if she went back, she must be a slave forever—she must be dragged down to the scenes of pollution which the slaveholders continually provide for most of the poor, sinking, wretched young women, whom they call their property. She formed her resolution; and just as those who were about to take her, were going to put hands upon her, to drag her back, she leaped over the balustrades of the bridge, and down she went to rise no more. She chose death, rather than to go back into the hands of those christian slaveholders from whom she had escaped.

Can it be possible that such things as these exist in the United States? Are not these the exceptions? Are any such scenes as this general? Are not such deeds condemned by the law and denounced by public opinion? Let me read to you a few of the laws of the slaveholding states of America. I think no better exposure of slavery can be made than is made by the laws of the states in which slavery exists. I prefer reading the laws to making any statement in confirmation of what I have said myself; for the slaveholders cannot object to this testimony, since it is the calm, the cool, the deliberate enactment of their wisest heads, of their most clear-sighted, their own constituted representatives. "If more than seven slaves together are found in any road without a white person, twenty lashes a piece; for visiting a plantation without a written pass, ten lashes; for letting loose a boat from where it is made fast, thirty-nine lashes for the first offense; and for the second, shall have cut off from his head one ear; for keeping or carrying a club, thirty-nine lashes; for having any article for sale, without a ticket from his master, ten lashes; for traveling in any other than the most usual and accustomed road, when going alone to any place, forty lashes; for traveling in the night without a pass, forty lashes." I am afraid you do not understand the awful character of these lashes. You must bring it before your mind. A human being in a perfect state of nudity, tied hand and foot to a stake, and a strong man standing behind with a heavy whip, knotted at the end, each blow cutting into the flesh, and leaving the warm blood dripping to the feet; and for these trifles. "For being found in another person's negro-quarters, forty lashes; for hunting with dogs in the woods, thirty lashes; for being on horseback without the written permission of his master, twenty-five lashes; for riding or going abroad in the night, or riding horses in the day time, without leave, a slave may be whipped, cropped, or branded in the cheek with the letter R. or otherwise punished, such punishment not extending to life, or so as to render him unfit for labor." The laws referred to, may be found by consulting _Brevard's Digest; Haywood's Manual; Virginia Revised Code; Prince's Digest; Missouri Laws; Mississippi Revised Code_. A man, for going to visit his brethren, without the permission of his master—and in many instances he may not have that permission; his master, from caprice or other reasons, may not be willing to allow it—may be caught on his way, dragged to a post, the branding-iron heated, and the name of his master or the letter R branded into his cheek or on his forehead. They treat slaves thus, on the principle that they must punish for light offenses, in order to prevent the commission of larger ones. I wish you to mark that in the single state of Virginia there are seventy-one crimes for which a colored man may be executed; while there are only three of these crimes, which, when committed by a white man, will subject him to that punishment. There are many of these crimes which if the white man did not commit, he would be regarded as a scoundrel and a coward. In the state of Maryland, there is a law to this effect: that if a slave shall strike his master, he may be hanged, his head severed from his body, his body quartered, and his head and quarters set up in the most prominent places in the neighborhood. If a colored woman, in the defense of her own virtue, in defense of her own person, should shield herself from the brutal attacks of her tyrannical master, or make the slightest resistance, she may be killed on the

spot. No law whatever will bring the guilty man to justice for the crime.

But you will ask me, can these things be possible in a land professing Christianity? Yes, they are so; and this is not the worst. No; a darker feature is yet to be presented than the mere existence of these facts. I have to inform you that the religion of the southern states, at this time, is the great supporter, the great sanctioner of the bloody atrocities to which I have referred. While America is printing tracts and bibles; sending missionaries abroad to convert the heathen; expending her money in various ways for the promotion of the gospel in foreign lands—the slave not only lies forgotten, uncared for, but is trampled under foot by the very churches of the land. What have we in America? Why, we have slavery made part of the religion of the land. Yes, the pulpit there stands up as the great defender of this cursed _institution_, as it is called. Ministers of religion come forward and torture the hallowed pages of inspired wisdom to sanction the bloody deed. They stand forth as the foremost, the strongest defenders of this "institution." As a proof of this, I need not do more than state the general fact, that slavery has existed under the droppings of the sanctuary of the south for the last two hundred years, and there has not been any war between the _religion_ and the _slavery_ of the south. Whips, chains, gags, and thumb-screws have all lain under the droppings of the sanctuary, and instead of rusting from off the limbs of the bondman, those droppings have served to preserve them in all their strength. Instead of preaching the gospel against this tyranny, rebuke, and wrong, ministers of religion have sought, by all and every means, to throw in the back-ground whatever in the bible could be construed into opposition to slavery, and to bring forward that which they could torture into its support. This I conceive to be the darkest feature of slavery, and the most difficult to attack, because it is identified with religion, and exposes those who denounce it to the charge of infidelity. Yes, those with whom I have been laboring, namely, the old organization anti-slavery society of America, have been again and again stigmatized as infidels, and for what reason? Why, solely in consequence of the faithfulness of their attacks upon the slaveholding religion of the southern states, and the northern religion that sympathizes with it. I have found it difficult to speak on this matter without persons coming forward and saying, "Douglass, are you not afraid of injuring the cause of Christ? You do not desire to do so, we know; but are you not undermining religion?" This has been said to me again and again, even since I came to this country, but I cannot be induced to leave off these exposures. I love the religion of our blessed Savior. I love that religion that comes from above, in the "wisdom of God," which is first pure, then peaceable, gentle, and easy to be entreated, full of mercy and good fruits, without partiality and without hypocrisy. I love that religion that sends its votaries to bind up the wounds of him that has fallen among thieves. I love that religion that makes it the duty of its disciples to visit the father less and the widow in their affliction. I love that religion that is based upon the glorious principle, of love to God and love to man; which makes its followers do unto others as they themselves would be done by. If you demand liberty to yourself, it says, grant it to your neighbors. If you claim a right to think for yourself, it says, allow your neighbors the same right. If you claim to act for yourself, it says, allow your neighbors the same right. It is because I love this religion that I hate the slaveholding, the woman-whipping, the mind-darkening, the soul-destroying religion that exists in the southern states of America. It is because I regard the one as good, and pure, and holy, that I cannot but regard the other as bad, corrupt, and wicked. Loving the one I must hate the other; holding to the one I must reject the other.

I may be asked, why I am so anxious to bring this subject before the British public—why I do not confine my efforts to the United States? My answer is, first, that slavery is the common enemy of mankind, and all mankind should be made acquainted with its abominable character. My next answer is, that the slave is a man, and, as such, is entitled to your sympathy as a brother. All the feelings, all the susceptibilities, all the capacities, which you have, he has. He is a part of the human family. He has been the prey—the common prey—of Christendom for the last three hundred years, and it is but right, it is but just, it is but proper, that his wrongs should be known throughout the world. I have another reason for bringing this matter before the British public, and it is this: slavery is a system of wrong, so blinding to all around, so hardening to the heart, so corrupting to the morals, so deleterious to religion, so sapping to all the principles of justice in its immediate vicinity, that the community surrounding it lack the moral stamina necessary to its removal. It is a system of such gigantic evil, so strong, so overwhelming in its power, that no one nation is equal to its removal. It requires the humanity of Christianity, the morality of the world to remove it. Hence, I call upon the people of Britain to look at this matter, and to exert the influence I am about to show they possess, for the removal of slavery from America. I can appeal to them, as strongly by their regard for the slaveholder as for the slave, to labor in this cause. I am here, because you have an influence on America that no other nation can have. You have been drawn together by the power of steam to a marvelous extent; the distance between London and Boston is now reduced to some twelve or fourteen days, so that the denunciations against slavery, uttered in London this week, may be heard in a fortnight in the streets of Boston, and reverberating amidst the hills of Massachusetts. There is nothing said here against slavery that will not be recorded in the United States. I am here, also, because the slaveholders do not want me to be here; they would rather that I were not here. I have adopted a maxim laid down by Napoleon, never to occupy ground which the enemy would like me to occupy. The slaveholders would much rather have me, if I will

denounce slavery, denounce it in the northern states, where their friends and supporters are, who will stand by and mob me for denouncing it. They feel something as the man felt, when he uttered his prayer, in which he made out a most horrible case for himself, and one of his neighbors touched him and said, “My friend, I always had the opinion of you that you have now expressed for yourself—that you are a very great sinner.” Coming from himself, it was all very well, but coming from a stranger it was rather cutting. The slaveholders felt that when slavery was denounced among themselves, it was not so bad; but let one of the slaves get loose, let him summon the people of Britain, and make known to them the conduct of the slaveholders toward their slaves, and it cuts them to the quick, and produces a sensation such as would be produced by nothing else. The power I exert now is something like the power that is exerted by the man at the end of the lever; my influence now is just in proportion to the distance that I am from the United States. My exposure of slavery abroad will tell more upon the hearts and consciences of slaveholders, than if I was attacking them in America; for almost every paper that I now receive from the United States, comes teeming with statements about this fugitive Negro, calling him a “glib-tongued scoundrel,” and saying that he is running out against the institutions and people of America. I deny the charge that I am saying a word against the institutions of America, or the people, as such. What I have to say is against slavery and slaveholders. I feel at liberty to speak on this subject. I have on my back the marks of the lash; I have four sisters and one brother now under the galling chain. I feel it my duty to cry aloud and spare not. I am not averse to having the good opinion of my fellow creatures. I am not averse to being kindly regarded by all men; but I am bound, even at the hazard of making a large class of religionists in this country hate me, oppose me, and malign me as they have done—I am bound by the prayers, and tears, and entreaties of three millions of kneeling bondsmen, to have no compromise with men who are in any shape or form connected with the slaveholders of America. I expose slavery in this country, because to expose it is to kill it. Slavery is one of those monsters of darkness to whom the light of truth is death. Expose slavery, and it dies. Light is to slavery what the heat of the sun is to the root of a tree; it must die under it. All the slaveholder asks of me is silence. He does not ask me to go abroad and preach _in favor_ of slavery; he does not ask any one to do that. He would not say that slavery is a good thing, but the best under the circumstances. The slaveholders want total darkness on the subject. They want the hatchway shut down, that the monster may crawl in his den of darkness, crushing human hopes and happiness, destroying the bondman at will, and having no one to reprove or rebuke him. Slavery shrinks from the light; it hateth the light, neither cometh to the light, lest its deeds should be reproved. To tear off the mask from this abominable system, to expose it to the light of heaven, aye, to the heat of the sun, that it may burn and wither it out of existence, is my object in coming to this country. I want the slaveholder surrounded, as by a wall of anti-slavery fire, so that he may see the condemnation of himself and his system glaring down in letters of light. I want him to feel that he has no sympathy in England, Scotland, or Ireland; that he has none in Canada, none in Mexico, none among the poor wild Indians; that the voice of the civilized, aye, and savage world is against him. I would have condemnation blaze down upon him in every direction, till, stunned and overwhelmed with shame and confusion, he is compelled to let go the grasp he holds upon the persons of his victims, and restore them to their long-lost rights.

Dr. Campbell’s Reply

From Rev. Dr. Campbell’s brilliant reply we extract the following: FREDERICK DOUGLASS, “the beast of burden,” the portion of “goods and chattels,” the representative of three millions of men, has been raised up! Shall I say the _man?_ If there is a man on earth, he is a man. My blood boiled within me when I heard his address tonight, and thought that he had left behind him three millions of such men.

We must see more of this man; we must have more of this man. One would have taken a voyage round the globe some forty years back—especially since the introduction of steam—to have heard such an exposure of slavery from the lips of a slave. It will be an era in the individual history of the present assembly. Our children—our boys and girls—I have tonight seen the delightful sympathy of their hearts evinced by their heaving breasts, while their eyes sparkled with wonder and admiration, that this black man—this slave—had so much logic, so much wit, so much fancy, so much eloquence. He was something more than a man, according to their little notions. Then, I say, we must hear him again. We have got a purpose to accomplish. He has appealed to the pulpit of England. The English pulpit is with him. He has appealed to the press of England; the press of England is conducted by English hearts, and that press will do him justice. About ten days hence, and his second master, who may well prize “such a piece of goods,” will have the pleasure of reading his burning words, and his first master will bless himself that he has got quit of him. We have to create public opinion, or rather, not to create it, for it is created already; but we have to foster it; and when tonight I heard those magnificent words—the words of Curran, by which my heart, from boyhood, has ofttimes been deeply moved—I rejoice to think that they embody an instinct of an Englishman’s nature. I heard, with inexpressible delight, how they told on this mighty mass of the citizens of the metropolis.

Britain has now no slaves; we can therefore talk to the other nations now, as we could not have talked a dozen years ago. I want the whole of the London ministry to meet Douglass. For as his appeal is to England, and throughout England, I should rejoice in the idea of churchmen and dissenters merging all sectional distinctions in this cause. Let us have a public breakfast. Let the ministers meet him; let them hear him; let them grasp his hand; and let him enlist their sympathies on behalf of the slave. Let him inspire them with abhorrence of the man-stealer—the slaveholder. No slaveholding American shall ever my cross my door. No slaveholding or slavery-supporting minister shall ever pollute my pulpit. While I have a tongue to speak, or a hand to write, I will, to the utmost of my power, oppose these slaveholding men. We must have Douglass amongst us to aid in fostering public opinion.

The great conflict with slavery must now take place in America; and while they are adding other slave states to the Union, our business is to step forward and help the abolitionists there. It is a pleasing circumstance that such a body of men has risen in America, and whilst we hurl our thunders against her slavers, let us make a distinction between those who advocate slavery and those who oppose it. George Thompson has been there. This man, Frederick Douglass, has been there, and has been compelled to flee. I wish, when he first set foot on our shores, he had made a solemn vow, and said, “Now that I am free, and in the sanctuary of freedom, I will never return till I have seen the emancipation of my country completed.” He wants to surround these men, the slaveholders, as by a wall of fire; and he himself may do much toward kindling it. Let him travel over the island—east, west, north, and south—everywhere diffusing knowledge and awakening principle, till the whole nation become a body of petitioners to America. He will, he must, do it. He must for a season make England his home. He must send for his wife. He must send for his children. I want to see the sons and daughters of such a sire. We, too, must do something for him and them worthy of the English name. I do not like the idea of a man of such mental dimensions, such moral courage, and all but incomparable talent, having his own small wants, and the wants of a distant wife and children, supplied by the poor profits of his publication, the sketch of his life. Let the pamphlet be bought by tens of thousands. But we will do something more for him, shall we not?

It only remains that we pass a resolution of thanks to Frederick Douglass, the slave that was, the man that is! He that was covered with chains, and that is now being covered with glory, and whom we will send back a gentleman.

LETTER TO HIS OLD MASTER. 11. To My Old Master, Thomas Auld

SIR—The long and intimate, though by no means friendly, relation which unhappily subsisted between you and myself, leads me to hope that you will easily account for the great liberty which I now take in addressing you in this open and public manner. The same fact may remove any disagreeable surprise which you may experience on again finding your name coupled with mine, in any other way than in an advertisement, accurately describing my person, and offering a large sum for my arrest. In thus dragging you again before the public, I am aware that I shall subject myself to no inconsiderable amount of censure. I shall probably be charged with an unwarrantable, if not a wanton and reckless disregard of the rights and properties of private life. There are those north as well as south who entertain a much higher respect for rights which are merely conventional, than they do for rights which are personal and essential. Not a few there are in our country, who, while they have no scruples against robbing the laborer of the hard earned results of his patient industry, will be shocked by the extremely indelicate manner of bringing your name before the public. Believing this to be the case, and wishing to meet every reasonable or plausible objection to my conduct, I will frankly state the ground upon which I justfy(sic) myself in this instance, as well as on former occasions when I have thought proper to mention your name in public. All will agree that a man guilty of theft, robbery, or murder, has forfeited the right to concealment and private life; that the community have a right to subject such persons to the most complete exposure. However much they may desire retirement, and aim to conceal themselves and their movements from the popular gaze, the public have a right to ferret them out, and bring their conduct before the proper tribunals of the country for investigation. Sir, you will undoubtedly make the proper application of these generally admitted principles, and will easily see the light in which you are regarded by me; I will not therefore manifest ill temper, by calling you hard names. I know you to be a man of some intelligence, and can readily determine the precise estimate which I entertain of your character. I may therefore indulge in language which may seem to others indirect and ambiguous, and yet be quite well understood by yourself.

I have selected this day on which to address you, because it is the anniversary of my emancipation; and knowing no better way, I am led to this as the best mode of celebrating that truly important events. Just ten years ago this beautiful September morning, yon bright sun beheld me a slave—a poor degraded chattel—trembling at the sound of your voice, lamenting that I was a man, and wishing myself a brute. The hopes which I had treasured up for weeks of a safe and successful escape from your grasp, were powerfully confronted at this last hour by dark clouds of doubt and fear, making my person shake and my bosom to heave with the heavy contest between hope and fear. I have no words to describe to you the deep agony of soul which I experienced on that

never-to-be-forgotten morning—for I left by daylight. I was making a leap in the dark. The probabilities, so far as I could by reason determine them, were stoutly against the undertaking. The preliminaries and precautions I had adopted previously, all worked badly. I was like one going to war without weapons—ten chances of defeat to one of victory. One in whom I had confided, and one who had promised me assistance, appalled by fear at the trial hour, deserted me, thus leaving the responsibility of success or failure solely with myself. You, sir, can never know my feelings. As I look back to them, I can scarcely realize that I have passed through a scene so trying. Trying, however, as they were, and gloomy as was the prospect, thanks be to the Most High, who is ever the God of the oppressed, at the moment which was to determine my whole earthly career, His grace was sufficient; my mind was made up. I embraced the golden opportunity, took the morning tide at the flood, and a free man, young, active, and strong, is the result.

I have often thought I should like to explain to you the grounds upon which I have justified myself in running away from you. I am almost ashamed to do so now, for by this time you may have discovered them yourself. I will, however, glance at them. When yet but a child about six years old, I imbibed the determination to run away. The very first mental effort that I now remember on my part, was an attempt to solve the mystery—why am I a slave? and with this question my youthful mind was troubled for many days, pressing upon me more heavily at times than others. When I saw the slave-driver whip a slave-woman, cut the blood out of her neck, and heard her piteous cries, I went away into the corner of the fence, wept and pondered over the mystery. I had, through some medium, I know not what, got some idea of God, the Creator of all mankind, the black and the white, and that he had made the blacks to serve the whites as slaves. How he could do this and be _good_, I could not tell. I was not satisfied with this theory, which made God responsible for slavery, for it pained me greatly, and I have wept over it long and often. At one time, your first wife, Mrs. Lucretia, heard me sighing and saw me shedding tears, and asked of me the matter, but I was afraid to tell her. I was puzzled with this question, till one night while sitting in the kitchen, I heard some of the old slaves talking of their parents having been stolen from Africa by white men, and were sold here as slaves. The whole mystery was solved at once. Very soon after this, my Aunt Jinny and Uncle Noah ran away, and the great noise made about it by your father-in-law, made me for the first time acquainted with the fact, that there were free states as well as slave states. From that time, I resolved that I would some day run away. The morality of the act I dispose of as follows: I am myself; you are yourself; we are two distinct persons, equal persons. What you are, I am. You are a man, and so am I. God created both, and made us separate beings. I am not by nature bond to you, or you to me. Nature does not make your existence depend upon me, or mine to depend upon yours. I cannot walk upon your legs, or you upon mine. I cannot breathe for you, or you for me; I must breathe for myself, and you for yourself. We are distinct persons, and are each equally provided with faculties necessary to our individual existence. In leaving you, I took nothing but what belonged to me, and in no way lessened your means for obtaining an _honest_ living. Your faculties remained yours, and mine became useful to their rightful owner. I therefore see no wrong in any part of the transaction. It is true, I went off secretly; but that was more your fault than mine. Had I let you into the secret, you would have defeated the enterprise entirely; but for this, I should have been really glad to have made you acquainted with my intentions to leave.

You may perhaps want to know how I like my present condition. I am free to say, I greatly prefer it to that which I occupied in Maryland. I am, however, by no means prejudiced against the state as such. Its geography, climate, fertility, and products, are such as to make it a very desirable abode for any man; and but for the existence of slavery there, it is not impossible that I might again take up my abode in that state. It is not that I love Maryland less, but freedom more. You will be surprised to learn that people at the north labor under the strange delusion that if the slaves were emancipated at the south, they would flock to the north. So far from this being the case, in that event, you would see many old and familiar faces back again to the south. The fact is, there are few here who would not return to the south in the event of emancipation. We want to live in the land of our birth, and to lay our bones by the side of our fathers; and nothing short of an intense love of personal freedom keeps us from the south. For the sake of this, most of us would live on a crust of bread and a cup of cold water.

Since I left you, I have had a rich experience. I have occupied stations which I never dreamed of when a slave. Three out of the ten years since I left you, I spent as a common laborer on the wharves of New Bedford, Massachusetts. It was there I earned my first free dollar. It was mine. I could spend it as I pleased. I could buy hams or herring with it, without asking any odds of anybody. That was a precious dollar to me. You remember when I used to make seven, or eight, or even nine dollars a week in Baltimore, you would take every cent of it from me every Saturday night, saying that I belonged to you, and my earnings also. I never liked this conduct on your part—to say the best, I thought it a little mean. I would not have served you so. But let that pass. I was a little awkward about counting money in New England fashion when I first landed in New Bedford. I came near betraying myself several times. I caught myself saying php, for fourpence; and at one time a man actually charged me with being a runaway, whereupon I was silly enough to become one by running away from him, for I was greatly afraid he might adopt measures to get me again into

slavery, a condition I then dreaded more than death.

I soon learned, however, to count money, as well as to make it, and got on swimmingly. I married soon after leaving you; in fact, I was engaged to be married before I left you; and instead of finding my companion a burden, she was truly a helpmate. She went to live at service, and I to work on the wharf, and though we toiled hard the first winter, we never lived more happily. After remaining in New Bedford for three years, I met with William Lloyd Garrison, a person of whom you have _possibly_ heard, as he is pretty generally known among slaveholders. He put it into my head that I might make myself serviceable to the cause of the slave, by devoting a portion of my time to telling my own sorrows, and those of other slaves, which had come under my observation. This was the commencement of a higher state of existence than any to which I had ever aspired. I was thrown into society the most pure, enlightened, and benevolent, that the country affords. Among these I have never forgotten you, but have invariably made you the topic of conversation—thus giving you all the notoriety I could do. I need not tell you that the opinion formed of you in these circles is far from being favorable. They have little respect for your honesty, and less for your religion.

But I was going on to relate to you something of my interesting experience. I had not long enjoyed the excellent society to which I have referred, before the light of its excellence exerted a beneficial influence on my mind and heart. Much of my early dislike of white persons was removed, and their manners, habits, and customs, so entirely unlike what I had been used to in the kitchen-quarters on the plantations of the south, fairly charmed me, and gave me a strong disrelish for the coarse and degrading customs of my former condition. I therefore made an effort so to improve my mind and deportment, as to be somewhat fitted to the station to which I seemed almost providentially called. The transition from degradation to respectability was indeed great, and to get from one to the other without carrying some marks of one's former condition, is truly a difficult matter. I would not have you think that I am now entirely clear of all plantation peculiarities, but my friends here, while they entertain the strongest dislike to them, regard me with that charity to which my past life somewhat entitles me, so that my condition in this respect is exceedingly pleasant. So far as my domestic affairs are concerned, I can boast of as comfortable a dwelling as your own. I have an industrious and neat companion, and four dear children—the oldest a girl of nine years, and three fine boys, the oldest eight, the next six, and the youngest four years old. The three oldest are now going regularly to school—two can read and write, and the other can spell, with tolerable correctness, words of two syllables. Dear fellows! they are all in comfortable beds, and are sound asleep, perfectly secure under my own roof. There are no slaveholders here to rend my heart by snatching them from my arms, or blast a mother's dearest hopes by tearing them from her bosom. These dear children are ours—not to work up into rice, sugar, and tobacco, but to watch over, regard, and protect, and to rear them up in the nurture and admonition of the gospel—to train them up in the paths of wisdom and virtue, and, as far as we can, to make them useful to the world and to themselves. Oh! sir, a slaveholder never appears to me so completely an agent of hell, as when I think of and look upon my dear children. It is then that my feelings rise above my control. I meant to have said more with respect to my own prosperity and happiness, but thoughts and feelings which this recital has quickened, unfit me to proceed further in that direction. The grim horrors of slavery rise in all their ghastly terror before me; the wails of millions pierce my heart and chill my blood. I remember the chain, the gag, the bloody whip; the death-like gloom overshadowing the broken spirit of the fettered bondman; the appalling liability of his being torn away from wife and children, and sold like a beast in the market. Say not that this is a picture of fancy. You well know that I wear stripes on my back, inflicted by your direction; and that you, while we were brothers in the same church, caused this right hand, with which I am now penning this letter, to be closely tied to my left, and my person dragged, at the pistol's mouth, fifteen miles, from the Bay Side to Easton, to be sold like a beast in the market, for the alleged crime of intending to escape from your possession. All this, and more, you remember, and know to be perfectly true, not only of yourself, but of nearly all of the slaveholders around you.

At this moment, you are probably the guilty holder of at least three of my own dear sisters, and my only brother, in bondage. These you regard as your property. They are recorded on your ledger, or perhaps have been sold to human flesh-mongers, with a view to filling our own ever-hungry purse. Sir, I desire to know how and where these dear sisters are. Have you sold them? or are they still in your possession? What has become of them? are they living or dead? And my dear old grandmother, whom you turned out like an old horse to die in the woods—is she still alive? Write and let me know all about them. If my grandmother be still alive, she is of no service to you, for by this time she must be nearly eighty years old—too old to be cared for by one to whom she has ceased to be of service; send her to me at Rochester, or bring her to Philadelphia, and it shall be the crowning happiness of my life to take care of her in her old age. Oh! she was to me a mother and a father, so far as hard toil for my comfort could make her such. Send me my grandmother! that I may watch over and take care of her in her old age. And my sisters—let me know all about them. I would write to them, and learn all I want to know of them, without disturbing you in any way, but that, through your unrighteous conduct, they have been entirely deprived of the power to read and write. You have kept them in utter ignorance, and have therefore robbed them of the sweet enjoyments of writing or receiving letters from absent friends and relatives. Your wickedness

and cruelty, committed in this respect on your fellow-creatures, are greater than all the stripes you have laid upon my back or theirs. It is an outrage upon the soul, a war upon the immortal spirit, and one for which you must give account at the bar of our common Father and Creator.

The responsibility which you have assumed in this regard is truly awful, and how you could stagger under it these many years is marvelous. Your mind must have become darkened, your heart hardened, your conscience seared and petrified, or you would have long since thrown off the accursed load, and sought relief at the hands of a sin-forgiving God. How, let me ask, would you look upon me, were I, some dark night, in company with a band of hardened villains, to enter the precincts of your elegant dwelling, and seize the person of your own lovely daughter, Amanda, and carry her off from your family, friends, and all the loved ones of her youth—make her my slave—compel her to work, and I take her wages—place her name on my ledger as property—disregard her personal rights—fetter the powers of her immortal soul by denying her the right and privilege of learning to read and write—feed her coarsely—clothe her scantily, and whip her on the naked back occasionally; more, and still more horrible, leave her unprotected—a degraded victim to the brutal lust of fiendish overseers, who would pollute, blight, and blast her fair soul—rob her of all dignity—destroy her virtue, and annihilate in her person all the graces that adorn the character of virtuous womanhood? I ask, how would you regard me, if such were my conduct? Oh! the vocabulary of the damned would not afford a word sufficiently infernal to express your idea of my God-provoking wickedness. Yet, sir, your treatment of my beloved sisters is in all essential points precisely like the case I have now supposed. Damning as would be such a deed on my part, it would be no more so than that which you have committed against me and my sisters.

I will now bring this letter to a close; you shall hear from me again unless you let me hear from you. I intend to make use of you as a weapon with which to assail the system of slavery—as a means of concentrating public attention on the system, and deepening the horror of trafficking in the souls and bodies of men. I shall make use of you as a means of exposing the character of the American church and clergy—and as a means of bringing this guilty nation, with yourself, to repentance. In doing this, I entertain no malice toward you personally. There is no roof under which you would be more safe than mine, and there is nothing in my house which you might need for your comfort, which I would not readily grant. Indeed, I should esteem it a privilege to set you an example as to how mankind ought to treat each other.

I am your fellow-man, but not your slave.

THE NATURE OF SLAVERY. Extract from a Lecture on Slavery, at Rochester,

December 1, 1850

More than twenty years of my life were consumed in a state of slavery. My childhood was environed by the baneful peculiarities of the slave system. I grew up to manhood in the presence of this hydra headed monster—not as a master—not as an idle spectator—not as the guest of the slaveholder—but as A SLAVE, eating the bread and drinking the cup of slavery with the most degraded of my brother-bondmen, and sharing with them all the painful conditions of their wretched lot. In consideration of these facts, I feel that I have a right to speak, and to speak _strongly_. Yet, my friends, I feel bound to speak truly.

Goading as have been the cruelties to which I have been subjected—bitter as have been the trials through which I have passed—exasperating as have been, and still are, the indignities offered to my manhood—I find in them no excuse for the slightest departure from truth in dealing with any branch of this subject.

First of all, I will state, as well as I can, the legal and social relation of master and slave. A master is one—to speak in the vocabulary of the southern states—who claims and exercises a right of property in the person of a fellow-man. This he does with the force of the law and the sanction of southern religion. The law gives the master absolute power over the slave. He may work him, flog him, hire him out, sell him, and, in certain contingencies, _kill_ him, with perfect impunity. The slave is a human being, divested of all rights—reduced to the level of a brute—a mere “chattel” in the eye of the law—placed beyond the circle of human brotherhood—cut off from his kind—his name, which the “recording angel” may have enrolled in heaven, among the blest, is impiously inserted in a _master’s ledger_, with horses, sheep, and swine. In law, the slave has no wife, no children, no country, and no home. He can own nothing, possess nothing, acquire nothing, but what must belong to another. To eat the fruit of his own toil, to clothe his person with the work of his own hands, is considered stealing. He toils that another may reap the fruit; he is industrious that another may live in idleness; he eats unbolted meal that another may eat the bread of fine flour; he labors in chains at home, under a burning sun and biting lash, that another may ride in ease and splendor abroad; he lives in ignorance that another may be

educated; he is abused that another may be exalted; he rests his toil-worn limbs on the cold, damp ground that another may repose on the softest pillow; he is clad in coarse and tattered raiment that another may be arrayed in purple and fine linen; he is sheltered only by the wretched hovel that a master may dwell in a magnificent mansion; and to this condition he is bound down as by an arm of iron.

From this monstrous relation there springs an unceasing stream of most revolting cruelties. The very accompaniments of the slave system stamp it as the offspring of hell itself. To ensure good behavior, the slaveholder relies on the whip; to induce proper humility, he relies on the whip; to rebuke what he is pleased to term insolence, he relies on the whip; to supply the place of wages as an incentive to toil, he relies on the whip; to bind down the spirit of the slave, to imbrute and destroy his manhood, he relies on the whip, the chain, the gag, the thumb-screw, the pillory, the bowie knife the pistol, and the blood-hound. These are the necessary and unvarying accompaniments of the system. Wherever slavery is found, these horrid instruments are also found. Whether on the coast of Africa, among the savage tribes, or in South Carolina, among the refined and civilized, slavery is the same, and its accompaniments one and the same. It makes no difference whether the slaveholder worships the God of the Christians, or is a follower of Mahomet, he is the minister of the same cruelty, and the author of the same misery. _Slavery_ is always _slavery;_ always the same foul, haggard, and damning scourge, whether found in the eastern or in the western hemisphere.

There is a still deeper shade to be given to this picture. The physical cruelties are indeed sufficiently harassing and revolting; but they are as a few grains of sand on the sea shore, or a few drops of water in the great ocean, compared with the stupendous wrongs which it inflicts upon the mental, moral, and religious nature of its hapless victims. It is only when we contemplate the slave as a moral and intellectual being, that we can adequately comprehend the unparalleled enormity of slavery, and the intense criminality of the slaveholder. I have said that the slave was a man. “What a piece of work is man! How noble in reason! How infinite in faculties! In form and moving how express and admirable! In action how like an angel! In apprehension how like a God! The beauty of the world! The paragon of animals!”

The slave is a man, “the image of God,” but “a little lower than the angels;” possessing a soul, eternal and indestructible; capable of endless happiness, or immeasurable woe; a creature of hopes and fears, of affections and passions, of joys and sorrows, and he is endowed with those mysterious powers by which man soars above the things of time and sense, and grasps, with undying tenacity, the elevating and sublimely glorious idea of a God. It is _such_ a being that is smitten and blasted. The first work of slavery is to mar and deface those characteristics of its victims which distinguish _men_ from _things_, and _persons_ from _property_. Its first aim is to destroy all sense of high moral and religious responsibility. It reduces man to a mere machine. It cuts him off from his Maker, it hides from him the laws of God, and leaves him to grope his way from time to eternity in the dark, under the arbitrary and despotic control of a frail, depraved, and sinful fellow-man. As the serpent-charmer of India is compelled to extract the deadly teeth of his venomous prey before he is able to handle him with impunity, so the slaveholder must strike down the conscience of the slave before he can obtain the entire mastery over his victim.

It is, then, the first business of the enslaver of men to blunt, deaden, and destroy the central principle of human responsibility. Conscience is, to the individual soul, and to society, what the law of gravitation is to the universe. It holds society together; it is the basis of all trust and confidence; it is the pillar of all moral rectitude. Without it, suspicion would take the place of trust; vice would be more than a match for virtue; men would prey upon each other, like the wild beasts of the desert; and earth would become a _hell_.

Nor is slavery more adverse to the conscience than it is to the mind. This is shown by the fact, that in every state of the American Union, where slavery exists, except the state of Kentucky, there are laws absolutely prohibitory of education among the slaves. The crime of teaching a slave to read is punishable with severe fines and imprisonment, and, in some instances, with _death itself_.

Nor are the laws respecting this matter a dead letter. Cases may occur in which they are disregarded, and a few instances may be found where slaves may have learned to read; but such are isolated cases, and only prove the rule. The great mass of slaveholders look upon education among the slaves as utterly subversive of the slave system. I well remember when my mistress first announced to my master that she had discovered that I could read. His face colored at once with surprise and chagrin. He said that “I was ruined, and my value as a slave destroyed; that a slave should know nothing but to obey his master; that to give a negro an inch would lead him to take an ell; that having learned how to read, I would soon want to know how to write; and that by-and-by I would be running away.” I think my audience will bear witness to the correctness of this philosophy, and to the literal fulfillment of this prophecy.

It is perfectly well understood at the south, that to educate a slave is to make him discontened(sic) with slavery, and to invest him with a power which shall open to him the treasures of freedom; and since the object of the slaveholder is to maintain complete authority over his slave, his constant vigilance is exercised to prevent everything which militates against, or endangers, the stability of his authority. Education being among the menacing influences, and, perhaps, the most dangerous, is, therefore, the most cautiously guarded against.

It is true that we do not often hear of the enforcement of the law, punishing as a crime the teaching of slaves to read, but this is not because of a want of disposition to enforce it. The true reason or explanation of the matter is this: there is the greatest unanimity of opinion among the white population in the south in favor of the policy of keeping the slave in ignorance. There is, perhaps, another reason why the law against education is so seldom violated. The slave is too poor to be able to offer a temptation sufficiently strong to induce a white man to violate it; and it is not to be supposed that in a community where the moral and religious sentiment is in favor of slavery, many martyrs will be found sacrificing their liberty and lives by violating those prohibitory enactments.

As a general rule, then, darkness reigns over the abodes of the enslaved, and “how great is that darkness!”

We are sometimes told of the contentment of the slaves, and are entertained with vivid pictures of their happiness. We are told that they often dance and sing; that their masters frequently give them wherewith to make merry; in fine, that they have little of which to complain. I admit that the slave does sometimes sing, dance, and appear to be merry. But what does this prove? It only proves to my mind, that though slavery is armed with a thousand stings, it is not able entirely to kill the elastic spirit of the bondman. That spirit will rise and walk abroad, despite of whips and chains, and extract from the cup of nature occasional drops of joy and gladness. No thanks to the slaveholder, nor to slavery, that the vivacious captive may sometimes dance in his chains; his very mirth in such circumstances stands before God as an accusing angel against his enslaver.

It is often said, by the opponents of the anti-slavery cause, that the condition of the people of Ireland is more deplorable than that of the American slaves. Far be it from me to underrate the sufferings of the Irish people. They have been long oppressed; and the same heart that prompts me to plead the cause of the American bondman, makes it impossible for me not to sympathize with the oppressed of all lands. Yet I must say that there is no analogy between the two cases. The Irishman is poor, but he is not a slave. He may be in rags, but he is not a slave. He is still the master of his own body, and can say with the poet, “The hand of Douglass is his own.” “The world is all before him, where to choose;” and poor as may be my opinion of the British parliament, I cannot believe that it will ever sink to such a depth of infamy as to pass a law for the recapture of fugitive Irishmen! The shame and scandal of kidnapping will long remain wholly monopolized by the American congress. The Irishman has not only the liberty to emigrate from his country, but he has liberty at home. He can write, and speak, and cooperate for the attainment of his rights and the redress of his wrongs.

The multitude can assemble upon all the green hills and fertile plains of the Emerald Isle; they can pour out their grievances, and proclaim their wants without molestation; and the press, that “swift-winged messenger,” can bear the tidings of their doings to the extreme bounds of the civilized world. They have their “Conciliation Hall,” on the banks of the Liffey, their reform clubs, and their newspapers; they pass resolutions, send forth addresses, and enjoy the right of petition. But how is it with the American slave? Where may he assemble? Where is his Conciliation Hall? Where are his newspapers? Where is his right of petition? Where is his freedom of speech? his liberty of the press? and his right of locomotion? He is said to be happy; happy men can speak. But ask the slave what is his condition—what his state of mind—what he thinks of enslavement? and you had as well address your inquiries to the _silent dead_. There comes no _voice_ from the enslaved. We are left to gather his feelings by imagining what ours would be, were our souls in his soul’s stead.

If there were no other fact descriptive of slavery, than that the slave is dumb, this alone would be sufficient to mark the slave system as a grand aggregation of human horrors.

Most who are present, will have observed that leading men in this country have been putting forth their skill to secure quiet to the nation. A system of measures to promote this object was adopted a few months ago in congress. The result of those measures is known. Instead of quiet, they have produced alarm; instead of peace, they have brought us war; and so it must ever be.

While this nation is guilty of the enslavement of three millions of innocent men and women, it is as idle to think of having a sound and lasting peace, as it is to think there is no God to take cognizance of the affairs of men. There can be no peace to the wicked while slavery continues in the land. It will be condemned; and while it is condemned there will be agitation. Nature must cease to be nature; men must become monsters; humanity must be transformed; Christianity must be exterminated; all ideas of justice and the

laws of eternal goodness must be utterly blotted out from the human soul—ere a system so foul and infernal can escape condemnation, or this guilty republic can have a sound, enduring peace.

INHUMANITY OF SLAVERY. Extract from A Lecture on Slavery, at Rochester,

December 8, 1850

The relation of master and slave has been called patriarchal, and only second in benignity and tenderness to that of the parent and child. This representation is doubtless believed by many northern people; and this may account, in part, for the lack of interest which we find among persons whom we are bound to believe to be honest and humane. What, then, are the facts? Here I will not quote my own experience in slavery; for this you might call one-sided testimony. I will not cite the declarations of abolitionists; for these you might pronounce exaggerations. I will not rely upon advertisements cut from newspapers; for these you might call isolated cases. But I will refer you to the laws adopted by the legislatures of the slave states. I give you such evidence, because it cannot be invalidated nor denied. I hold in my hand sundry extracts from the slave codes of our country, from which I will quote. * * *

Now, if the foregoing be an indication of kindness, _what is cruelty_? If this be parental affection, _what is bitter malignity_? A more atrocious and blood-thirsty string of laws could not well be conceived of. And yet I am bound to say that they fall short of indicating the horrible cruelties constantly practiced in the slave states.

I admit that there are individual slaveholders less cruel and barbarous than is allowed by law; but these form the exception. The majority of slaveholders find it necessary, to insure obedience, at times, to avail themselves of the utmost extent of the law, and many go beyond it. If kindness were the rule, we should not see advertisements filling the columns of almost every southern newspaper, offering large rewards for fugitive slaves, and describing them as being branded with irons, loaded with chains, and scarred by the whip. One of the most telling testimonies against the pretended kindness of slaveholders, is the fact that uncounted numbers of fugitives are now inhabiting the Dismal Swamp, preferring the untamed wilderness to their cultivated homes—choosing rather to encounter hunger and thirst, and to roam with the wild beasts of the forest, running the hazard of being hunted and shot down, than to submit to the authority of _kind_ masters.

I tell you, my friends, humanity is never driven to such an unnatural course of life, without great wrong. The slave finds more of the milk of human kindness in the bosom of the savage Indian, than in the heart of his _Christian_ master. He leaves the man of the _bible_, and takes refuge with the man of the _tomahawk_. He rushes from the praying slaveholder into the paws of the bear. He quits the homes of men for the haunts of wolves. He prefers to encounter a life of trial, however bitter, or death, however terrible, to dragging out his existence under the dominion of these _kind_ masters.

The apologists for slavery often speak of the abuses of slavery; and they tell us that they are as much opposed to those abuses as we are; and that they would go as far to correct those abuses and to ameliorate the condition of the slave as anybody. The answer to that view is, that slavery is itself an abuse; that it lives by abuse; and dies by the absence of abuse. Grant that slavery is right; grant that the relations of master and slave may innocently exist; and there is not a single outrage which was ever committed against the slave but what finds an apology in the very necessity of the case. As we said by a slaveholder (the Rev. A. G. Few) to the Methodist conference, “If the relation be right, the means to maintain it are also right;” for without those means slavery could not exist. Remove the dreadful scourge—the plaited thong—the galling fetter—the accursed chain—and let the slaveholder rely solely upon moral and religious power, by which to secure obedience to his orders, and how long do you suppose a slave would remain on his plantation? The case only needs to be stated; it carries its own refutation with it.

Absolute and arbitrary power can never be maintained by one man over the body and soul of another man, without brutal chastisement and enormous cruelty.

To talk of _kindness_ entering into a relation in which one party is robbed of wife, of children, of his hard earnings, of home, of friends, of society, of knowledge, and of all that makes this life desirable, is most absurd, wicked, and preposterous.

I have shown that slavery is wicked—wicked, in that it violates the great law of liberty, written on every human heart—wicked, in that it violates the first command of the decalogue—wicked, in that it fosters the most disgusting licentiousness—wicked, in that it mars and defaces the image of God by cruel and barbarous inflictions—wicked, in that it contravenes the laws of eternal justice, and tramples in the dust all the humane and heavenly precepts of the New Testament.

The evils resulting from this huge system of iniquity are not confined to the states south of Mason and Dixon's line. Its noxious influence can easily be traced throughout our northern borders. It comes even as far north as the state of New York. Traces of it may be seen even in Rochester; and travelers have told me it casts its gloomy shadows across the lake, approaching the very shores of Queen Victoria's dominions.

The presence of slavery may be explained by—as it is the explanation of—the mobocratic violence which lately disgraced New York, and which still more recently disgraced the city of Boston. These violent demonstrations, these outrageous invasions of human rights, faintly indicate the presence and power of slavery here. It is a significant fact, that while meetings for almost any purpose under heaven may be held unmolested in the city of Boston, that in the same city, a meeting cannot be peaceably held for the purpose of preaching the doctrine of the American Declaration of Independence, "that all men are created equal." The pestiferous breath of slavery taints the whole moral atmosphere of the north, and enervates the moral energies of the whole people.

The moment a foreigner ventures upon our soil, and utters a natural repugnance to oppression, that moment he is made to feel that there is little sympathy in this land for him. If he were greeted with smiles before, he meets with frowns now; and it shall go well with him if he be not subjected to that peculiarly fining method of showing fealty to slavery, the assaults of a mob.

Now, will any man tell me that such a state of things is natural, and that such conduct on the part of the people of the north, springs from a consciousness of rectitude? No! every fibre of the human heart unites in detestation of tyranny, and it is only when the human mind has become familiarized with slavery, is accustomed to its injustice, and corrupted by its selfishness, that it fails to record its abhorrence of slavery, and does not exult in the triumphs of liberty.

The northern people have been long connected with slavery; they have been linked to a decaying corpse, which has destroyed the moral health. The union of the government; the union of the north and south, in the political parties; the union in the religious organizations of the land, have all served to deaden the moral sense of the northern people, and to impregnate them with sentiments and ideas forever in conflict with what as a nation we call _genius of American institutions_. Rightly viewed, this is an alarming fact, and ought to rally all that is pure, just, and holy in one determined effort to crush the monster of corruption, and to scatter "its guilty profits" to the winds. In a high moral sense, as well as in a national sense, the whole American people are responsible for slavery, and must share, in its guilt and shame, with the most obdurate men-stealers of the south.

While slavery exists, and the union of these states endures, every American citizen must bear the chagrin of hearing his country branded before the world as a nation of liars and hypocrites; and behold his cherished flag pointed at with the utmost scorn and derision. Even now an American _abroad_ is pointed out in the crowd, as coming from a land where men gain their fortunes by "the blood of souls," from a land of slave markets, of blood-hounds, and slave-hunters; and, in some circles, such a man is shunned altogether, as a moral pest. Is it not time, then, for every American to awake, and inquire into his duty with respect to this subject?

Wendell Phillips—the eloquent New England orator—on his return from Europe, in 1842, said, "As I stood upon the shores of Genoa, and saw floating on the placid waters of the Mediterranean, the beautiful American war ship Ohio, with her masts tapering proportionately aloft, and an eastern sun reflecting her noble form upon the sparkling waters, attracting the gaze of the multitude, my first impulse was of pride, to think myself an American; but when I thought that the first time that gallant ship would gird on her gorgeous apparel, and wake from beneath her sides her dormant thunders, it would be in defense of the African slave trade, I blushed in utter _shame_ for my country."

Let me say again, _slavery is alike the sin and the shame of the American people;_ it is a blot upon the American name, and the only national reproach which need make an American hang his head in shame, in the presence of monarchical governments.

With this gigantic evil in the land, we are constantly told to look _at home;_ if we say ought against crowned heads, we are pointed to our enslaved millions; if we talk of sending missionaries and bibles abroad, we are pointed to three millions now lying in worse than heathen darkness; if we express a word of sympathy for Kossuth and his Hungarian fugitive brethren, we are pointed to that horrible and hell-black enactment, "the fugitive slave bill."

Slavery blunts the edge of all our rebukes of tyranny abroad—the criticisms that we make upon other nations, only call forth ridicule, contempt, and scorn. In a word, we are made a reproach and a by-word to a mocking earth, and we must continue to be so made, so long as slavery continues to pollute our soil.

We have heard much of late of the virtue of patriotism, the love of country, &c., and this sentiment, so natural and so strong, has been impiously appealed to, by all the powers of human selfishness, to cherish the viper which is stinging our national life away. In

its name, we have been called upon to deepen our infamy before the world, to rivet the fetter more firmly on the limbs of the enslaved, and to become utterly insensible to the voice of human woe that is wafted to us on every southern gale. We have been called upon, in its name, to desecrate our whole land by the footprints of slave-hunters, and even to engage ourselves in the horrible business of kidnapping.

I, too, would invoke the spirit of patriotism; not in a narrow and restricted sense, but, I trust, with a broad and manly signification; not to cover up our national sins, but to inspire us with sincere repentance; not to hide our shame from the the(sic) world's gaze, but utterly to abolish the cause of that shame; not to explain away our gross inconsistencies as a nation, but to remove the hateful, jarring, and incongruous elements from the land; not to sustain an egregious wrong, but to unite all our energies in the grand effort to remedy that wrong.

I would invoke the spirit of patriotism, in the name of the law of the living God, natural and revealed, and in the full belief that "righteousness exalteth a nation, while sin is a reproach to any people." "He that walketh righteously, and speaketh uprightly; he that despiseth the gain of oppressions, that shaketh his hands from the holding of bribes, he shall dwell on high, his place of defense shall be the munitions of rocks, bread shall be given him, his water shall be sure."

We have not only heard much lately of patriotism, and of its aid being invoked on the side of slavery and injustice, but the very prosperity of this people has been called in to deafen them to the voice of duty, and to lead them onward in the pathway of sin. Thus has the blessing of God been converted into a curse. In the spirit of genuine patriotism, I warn the American people, by all that is just and honorable, to BEWARE!

I warn them that, strong, proud, and prosperous though we be, there is a power above us that can "bring down high looks; at the breath of whose mouth our wealth may take wings; and before whom every knee shall bow;" and who can tell how soon the avenging angel may pass over our land, and the sable bondmen now in chains, may become the instruments of our nation's chastisement! Without appealing to any higher feeling, I would warn the American people, and the American government, to be wise in their day and generation. I exhort them to remember the history of other nations; and I remind them that America cannot always sit "as a queen," in peace and repose; that prouder and stronger governments than this have been shattered by the bolts of a just God; that the time may come when those they now despise and hate, may be needed; when those whom they now compel by oppression to be enemies, may be wanted as friends. What has been, may be again. There is a point beyond which human endurance cannot go. The crushed worm may yet turn under the heel of the oppressor. I warn them, then, with all solemnity, and in the name of retributive justice, _to look to their ways;_ for in an evil hour, those sable arms that have, for the last two centuries, been engaged in cultivating and adorning the fair fields of our country, may yet become the instruments of terror, desolation, and death, throughout our borders.

It was the sage of the Old Dominion that said—while speaking of the possibility of a conflict between the slaves and the slaveholders—"God has no attribute that could take sides with the oppressor in such a contest. I tremble for my country when I reflect that God _is just_, and that his justice cannot sleep forever." Such is the warning voice of Thomas Jefferson; and every day's experience since its utterance until now, confirms its wisdom, and commends its truth.

WHAT TO THE SLAVE IS THE FOURTH OF JULY?. Extract from an Oration, at

Rochester, July 5, 1852

Fellow-Citizens—Pardon me, and allow me to ask, why am I called upon to speak here to-day? What have I, or those I represent, to do with your national independence? Are the great principles of political freedom and of natural justice, embodied in that Declaration of Independence, extended to us? and am I, therefore, called upon to bring our humble offering to the national altar, and to confess the benefits, and express devout gratitude for the blessings, resulting from your independence to us?

Would to God, both for your sakes and ours, that an affirmative answer could be truthfully returned to these questions! Then would my task be light, and my burden easy and delightful. For who is there so cold that a nation's sympathy could not warm him? Who so obdurate and dead to the claims of gratitude, that would not thankfully acknowledge such priceless benefits? Who so stolid and selfish, that would not give his voice to swell the hallelujahs of a nation's jubilee, when the chains of servitude had been torn from his limbs? I am not that man. In a case like that, the dumb might eloquently speak, and the "lame man leap as an hart."

But, such is not the state of the case. I say it with a sad sense of the disparity between us. I am not included within the pale of this glorious anniversary! Your high independence only reveals the immeasurable distance between us. The blessings in which you this day rejoice, are not enjoyed in common. The rich inheritance of justice, liberty, prosperity, and independence, bequeathed by your fathers, is shared by you, not by me. The sunlight that brought life and healing to you, has brought stripes and death to me. This Fourth of July is _yours_, not mine. You may rejoice, I must mourn. To drag a man in fetters into the grand illuminated temple of liberty, and call upon him to join you in joyous anthems, were inhuman mockery and sacrilegious irony. Do you mean, citizens, to mock me, by asking me to speak to-day? If so, there is a parallel to your conduct. And let me warn you that it is dangerous to copy the example of a nation whose crimes, towering up to heaven, were thrown down by the breath of the Almighty, burying that nation in irrecoverable ruin! I can to-day take up the plaintive lament of a peeled and woe-smitten people.

“By the rivers of Babylon, there we sat down. Yea! we wept when we remembered Zion. We hanged our harps upon the willows in the midst thereof. For there, they that carried us away captive, required of us a song; and they who wasted us required of us mirth, saying, Sing us one of the songs of Zion. How can we sing the Lord’s song in a strange land? If I forget thee, O Jerusalem, let my right hand forget her cunning. If I do not remember thee, let my tongue cleave to the roof of my mouth.”

Fellow-citizens, above your national, tumultous joy, I hear the mournful wail of millions, whose chains, heavy and grievous yesterday, are to-day rendered more intolerable by the jubilant shouts that reach them. If I do forget, if I do not faithfully remember those bleeding children of sorrow this day, “may my right hand forget her cunning, and may my tongue cleave to the roof of my mouth!” To forget them, to pass lightly over their wrongs, and to chime in with the popular theme, would be treason most scandalous and shocking, and would make me a reproach before God and the world. My subject, then, fellow-citizens, is AMERICAN SLAVERY. I shall see this day and its popular characteristics from the slave’s point of view. Standing there, identified with the American bondman, making his wrongs mine, I do not hesitate to declare, with all my soul, that the character and conduct of this nation never looked blacker to me than on this Fourth of July. Whether we turn to the declarations of the past, or to the professions of the present, the conduct of the nation seems equally hideous and revolting. America is false to the past, false to the present, and solemnly binds herself to be false to the future. Standing with God and the crushed and bleeding slave on this occasion, I will, in the name of humanity which is outraged, in the name of liberty which is fettered, in the name of the constitution and the bible, which are disregarded and trampled upon, dare to call in question and to denounce, with all the emphasis I can command, everything that serves to perpetuate slavery—the great sin and shame of America! “I will not equivocate; I will not excuse;” I will use the severest language I can command; and yet not one word shall escape me that any man, whose judgment is not blinded by prejudice, or who is not at heart a slaveholder, shall not confess to be right and just.

But I fancy I hear some one of my audience say, it is just in this circumstance that you and your brother abolitionists fail to make a favorable impression on the public mind. Would you argue more, and denounce less, would you persuade more and rebuke less, your cause would be much more likely to succeed. But, I submit, where all is plain there is nothing to be argued. What point in the anti-slavery creed would you have me argue? On what branch of the subject do the people of this country need light? Must I undertake to prove that the slave is a man? That point is conceded already. Nobody doubts it. The slaveholders themselves acknowledge it in the enactment of laws for their government. They acknowledge it when they punish disobedience on the part of the slave. There are seventy-two crimes in the state of Virginia, which, if committed by a black man (no matter how ignorant he be), subject him to the punishment of death; while only two of these same crimes will subject a white man to the like punishment. What is this but the acknowledgement that the slave is a moral, intellectual, and responsible being. The manhood of the slave is conceded. It is admitted in the fact that southern statute books are covered with enactments forbidding, under severe fines and penalties, the teaching of the slave to read or write. When you can point to any such laws, in reference to the beasts of the field, then I may consent to argue the manhood of the slave. When the dogs in your streets, when the fowls of the air, when the cattle on your hills, when the fish of the sea, and the reptiles that crawl, shall be unable to distinguish the slave from a brute, then will I argue with you that the slave is a man!

For the present, it is enough to affirm the equal manhood of the Negro race. Is it not astonishing that, while we are plowing, planting, and reaping, using all kinds of mechanical tools, erecting houses, constructing bridges, building ships, working in metals of brass, iron, copper, silver, and gold; that, while we are reading, writing, and cyphering, acting as clerks, merchants, and secretaries, having among us lawyers, doctors, ministers, poets, authors, editors, orators, and teachers; that, while we are engaged in all manner of enterprises common to other men—digging gold in California, capturing the whale in the Pacific, feeding sheep and cattle on the hillside, living, moving, acting, thinking, planning, living in families as husbands, wives, and children, and, above all, confessing and worshiping the Christian’s God, and looking hopefully for life and immortality beyond the grave—we are called upon

to prove that we are men!

Would you have me argue that man is entitled to liberty? that he is the rightful owner of his own body? You have already declared it. Must I argue the wrongfulness of slavery? Is that a question for republicans? Is it to be settled by the rules of logic and argumentation, as a matter beset with great difficulty, involving a doubtful application of the principle of justice, hard to be understood? How should I look to-day in the presence of Americans, dividing and subdividing a discourse, to show that men have a natural right to freedom, speaking of it relatively and positively, negatively and affirmatively? To do so, would be to make myself ridiculous, and to offer an insult to your understanding. There is not a man beneath the canopy of heaven that does not know that slavery is wrong for _him_.

What! am I to argue that it is wrong to make men brutes, to rob them of their liberty, to work them without wages, to keep them ignorant of their relations to their fellow-men, to beat them with sticks, to flay their flesh with the lash, to load their limbs with irons, to hunt them with dogs, to sell them at auction, to sunder their families, to knock out their teeth, to burn their flesh, to starve them into obedience and submission to their masters? Must I argue that a system, thus marked with blood and stained with pollution, is wrong? No; I will not. I have better employment for my time and strength than such arguments would imply.

What, then, remains to be argued? Is it that slavery is not divine; that God did not establish it; that our doctors of divinity are mistaken? There is blasphemy in the thought. That which is inhuman cannot be divine. Who can reason on such a proposition! They that can, may! I cannot. The time for such argument is past.

At a time like this, scorching irony, not convincing argument, is needed. Oh! had I the ability, and could I reach the nation's ear, I would to-day pour out a fiery stream of biting ridicule, blasting reproach, withering sarcasm, and stern rebuke. For it is not light that is needed, but fire; it is not the gentle shower, but thunder. We need the storm, the whirlwind, and the earthquake. The feeling of the nation must be quickened; the conscience of the nation must be roused; the propriety of the nation must be startled; the hypocrisy of the nation must be exposed; and its crimes against God and man must be proclaimed and denounced.

What to the American slave is your Fourth of July? I answer, a day that reveals to him, more than all other days in the year, the gross injustice and cruelty to which he is the constant victim. To him, your celebration is a sham; your boasted liberty, an unholy license; your national greatness, swelling vanity; your sounds of rejoicing are empty and heartless; your denunciations of tyrants, brass-fronted impudence; your shouts of liberty and equality, hollow mockery; your prayers and hymns, your sermons and thanksgivings, with all your religious parade and solemnity, are to him mere bombast, fraud, deception, impiety, and hypocrisy—a thin veil to cover up crimes which would disgrace a nation of savages. There is not a nation on the earth guilty of practices more shocking and bloody, than are the people of these United States, at this very hour.

Go where you may, search where you will, roam through all the monarchies and despotisms of the old world, travel through South America, search out every abuse, and when you have found the last, lay your facts by the side of the every-day practices of this nation, and you will say with me, that, for revolting barbarity and shameless hypocrisy, America reigns without a rival.

THE INTERNAL SLAVE TRADE. Extract from an Oration, at Rochester, July

5, 1852

Take the American slave trade, which, we are told by the papers, is especially prosperous just now. Ex-senator Benton tells us that the price of men was never higher than now. He mentions the fact to show that slavery is in no danger. This trade is one of the peculiarities of American institutions. It is carried on in all the large towns and cities in one-half of this confederacy; and millions are pocketed every year by dealers in this horrid traffic. In several states this trade is a chief source of wealth. It is called (in contradistinction to the foreign slave trade) _"the internal slave trade_." It is, probably, called so, too, in order to divert from it the horror with which the foreign slave trade is contemplated. That trade has long since been denounced by this government as piracy. It has been denounced with burning words, from the high places of the nation, as an execrable traffic. To arrest it, to put an end to it, this nation keeps a squadron, at immense cost, on the coast of Africa. Everywhere in this country, it is safe to speak of this foreign slave trade as a most inhuman traffic, opposed alike to the laws of God and of man. The duty to extirpate and destroy it is admitted even by our _doctors of divinity_. In order to put an end to it, some of these last have consented that their colored brethren (nominally free) should leave this country, and establish themselves on the western coast of Africa. It is, however, a notable fact, that, while so much execration is poured out by Americans, upon those engaged in the foreign slave trade, the men engaged in the slave trade between the states pass without condemnation, and their business is deemed honorable.

Behold the practical operation of this internal slave trade—the American slave trade sustained by American politics and American religion! Here you will see men and women reared like swine for the market. You know what is a swine-drover? I will show you a man-drover. They inhabit all our southern states. They perambulate the country, and crowd the highways of the nation with droves of human stock. You will see one of these human-flesh-jobbers, armed with pistol, whip, and bowie-knife, driving a company of a hundred men, women, and children, from the Potomac to the slave market at New Orleans. These wretched people are to be sold singly, or in lots, to suit purchasers. They are food for the cotton-field and the deadly sugar-mill. Mark the sad procession as it moves wearily along, and the inhuman wretch who drives them. Hear his savage yells and his blood-chilling oaths, as he hurries on his affrighted captives. There, see the old man, with locks thinned and gray. Cast one glance, if you please, upon that young mother, whose shoulders are bare to the scorching sun, her briny tears falling on the brow of the babe in her arms. See, too, that girl of thirteen, weeping, yes, weeping, as she thinks of the mother from whom she has been torn. The drove moves tardily. Heat and sorrow have nearly consumed their strength. Suddenly you hear a quick snap, like the discharge of a rifle; the fetters clank, and the chain rattles simultaneously; your ears are saluted with a scream that seems to have torn its way to the center of your soul. The crack you heard was the sound of the slave whip; the scream you heard was from the woman you saw with the babe. Her speed had faltered under the weight of her child and her chains; that gash on her shoulder tells her to move on. Follow this drove to New Orleans. Attend the auction; see men examined like horses; see the forms of women rudely and brutally exposed to the shocking gaze of American slave-buyers. See this drove sold and separated forever; and never forget the deep, sad sobs that arose from that scattered multitude. Tell me, citizens, where, under the sun, can you witness a spectacle more fiendish and shocking. Yet this is but a glance at the American slave trade, as it exists at this moment, in the ruling part of the United States.

I was born amid such sights and scenes. To me the American slave trade is a terrible reality. When a child, my soul was often pierced with a sense of its horrors. I lived on Philpot street, Fell's Point, Baltimore, and have watched from the wharves the slave ships in the basin, anchored from the shore, with their cargoes of human flesh, waiting for favorable winds to waft them down the Chesapeake. There was, at that time, a grand slave mart kept at the head of Pratt street, by Austin Woldfolk. His agents were sent into every town and county in Maryland, announcing their arrival through the papers, and on flaming hand-bills, headed, "cash for negroes." These men were generally well dressed, and very captivating in their manners; ever ready to drink, to treat, and to gamble. The fate of many a slave has depended upon the turn of a single card; and many a child has been snatched from the arms of its mothers by bargains arranged in a state of brutal drunkenness.

The flesh-mongers gather up their victims by dozens, and drive them, chained, to the general depot at Baltimore. When a sufficient number have been collected here, a ship is chartered, for the purpose of conveying the forlorn crew to Mobile or to New Orleans. From the slave-prison to the ship, they are usually driven in the darkness of night; for since the anti-slavery agitation a certain caution is observed.

In the deep, still darkness of midnight, I have been often aroused by the dead, heavy footsteps and the piteous cries of the chained gangs that passed our door. The anguish of my boyish heart was intense; and I was often consoled, when speaking to my mistress in the morning, to hear her say that the custom was very wicked; that she hated to hear the rattle of the chains, and the heart-rending cries. I was glad to find one who sympathized with me in my horror.

Fellow citizens, this murderous traffic is to-day in active operation in this boasted republic. In the solitude of my spirit, I see clouds of dust raised on the highways of the south; I see the bleeding footsteps; I hear the doleful wail of fettered humanity, on the way to the slave markets, where the victims are to be sold like horses, sheep, and swine, knocked off to the highest bidder. There I see the tenderest ties ruthlessly broken, to gratify the lust, caprice, and rapacity of the buyers and sellers of men. My soul sickens at the sight.

Is this the land your fathers loved? The freedom which they toiled to win? Is this the earth whereon they moved? Are these the graves they slumber in?

But a still more inhuman, disgraceful, and scandalous state of things remains to be presented. By an act of the American congress, not yet two years old, slavery has been nationalized in its most horrible and revolting form. By that act, Mason and Dixon's line has been obliterated; New York has become as Virginia; and the power to hold, hunt, and sell men, women, and children as slaves, remains no longer a mere state institution, but is now an institution of the whole United States. The power is coextensive with the star-spangled banner and American christianity. Where these go, may also go the merciless slave-hunter. Where these are, man is not sacred. He is a bird for the sportsman's gun. By that most foul and fiendish of all human decrees, the liberty and person of every man are put in peril. Your broad republican domain is a hunting-ground for _men_. Not for thieves and robbers, enemies of

society, merely, but for men guilty of no crime. Your law-makers have commanded all good citizens to engage in this hellish sport. Your president, your secretary of state, your lords, nobles, and ecclesiastics, enforce as a duty you owe to your free and glorious country and to your God, that you do this accursed thing. Not fewer than forty Americans have within the past two years been hunted down, and without a moment's warning, hurried away in chains, and consigned to slavery and excruciating torture. Some of these have had wives and children dependent on them for bread; but of this no account was made. The right of the hunter to his prey, stands superior to the right of marriage, and to _all_ rights in this republic, the rights of God included! For black men there are neither law, justice, humanity, nor religion. The fugitive slave law makes MERCY TO THEM A CRIME; and bribes the judge who tries them. An American judge GETS TEN DOLLARS FOR EVERY VICTIM HE CONSIGNS to slavery, and five, when he fails to do so. The oath of an(sic) two villains is sufficient, under this hell-black enactment, to send the most pious and exemplary black man into the remorseless jaws of slavery! His own testimony is nothing. He can bring no witnesses for himself. The minister of American justice is bound by the law to hear but _one side_, and that side is the side of the oppressor. Let this damning fact be perpetually told. Let it be thundered around the world, that, in tyrant-killing, king hating, people-loving, democratic, Christian America, the seats of justice are filled with judges, who hold their office under an open and palpable _bribe_, and are bound, in deciding in the case of a man's liberty, _to hear only his accusers!_

In glaring violation of justice, in shameless disregard of the forms of administering law, in cunning arrangement to entrap the defenseless, and in diabolical intent, this fugitive slave law stands alone in the annals of tyrannical legislation. I doubt if there be another nation on the globe having the brass and the baseness to put such a law on the statute-book. If any man in this assembly thinks differently from me in this matter, and feels able to disprove my statements, I will gladly confront him at any suitable time and place he may select.

THE SLAVERY PARTY. Extract from a Speech Delivered before the A. A. S.

Society, in New York, May, 1853.

Sir, it is evident that there is in this country a purely slavery party—a party which exists for no other earthly purpose but to promote the interests of slavery. The presence of this party is felt everywhere in the republic. It is known by no particular name, and has assumed no definite shape; but its branches reach far and wide in the church and in the state. This shapeless and nameless party is not intangible in other and more important respects. That party, sir, has determined upon a fixed, definite, and comprehensive policy toward the whole colored population of the United States. What that policy is, it becomes us as abolitionists, and especially does it become the colored people themselves, to consider and to understand fully. We ought to know who our enemies are, where they are, and what are their objects and measures. Well, sir, here is my version of it—not original with me—but mine because I hold it to be true.

I understand this policy to comprehend five cardinal objects. They are these: 1st. The complete suppression of all anti-slavery discussion. 2d. The expatriation of the entire free people of color from the United States. 3d. The unending perpetuation of slavery in this republic. 4th. The nationalization of slavery to the extent of making slavery respected in every state of the Union. 5th. The extension of slavery over Mexico and the entire South American states.

Sir, these objects are forcibly presented to us in the stern logic of passing events; in the facts which are and have been passing around us during the last three years. The country has been and is now dividing on these grand issues. In their magnitude, these issues cast all others into the shade, depriving them of all life and vitality. Old party ties are broken. Like is finding its like on either side of these great issues, and the great battle is at hand. For the present, the best representative of the slavery party in politics is the democratic party. Its great head for the present is President Pierce, whose boast it was, before his election, that his whole life had been consistent with the interests of slavery, that he is above reproach on that score. In his inaugural address, he reassures the south on this point. Well, the head of the slave power being in power, it is natural that the pro slavery elements should cluster around the administration, and this is rapidly being done. A fraternization is going on. The stringent protectionists and the free-traders strike hands. The supporters of Fillmore are becoming the supporters of Pierce. The silver-gray whig shakes hands with the hunker democrat; the former only differing from the latter in name. They are of one heart, one mind, and the union is natural and perhaps inevitable. Both hate Negroes; both hate progress; both hate the "higher law;" both hate William H. Seward; both hate the free democratic party; and upon this hateful basis they are forming a union of hatred. "Pilate and Herod are thus made friends." Even the central organ of the whig party is extending its beggar hand for a morsel from the table of slavery democracy, and when spurned from the feast by the more deserving, it pockets the insult; when kicked on one side it turns the

other, and preseveres in its importunities. The fact is, that paper comprehends the demands of the times; it understands the age and its issues; it wisely sees that slavery and freedom are the great antagonistic forces in the country, and it goes to its own side. Silver grays and hunkers all understand this. They are, therefore, rapidly sinking all other questions to nothing, compared with the increasing demands of slavery. They are collecting, arranging, and consolidating their forces for the accomplishment of their appointed work.

The keystone to the arch of this grand union of the slavery party of the United States, is the compromise of 1850. In that compromise we have all the objects of our slaveholding policy specified. It is, sir, favorable to this view of the designs of the slave power, that both the whig and the democratic party bent lower, sunk deeper, and strained harder, in their conventions, preparatory to the late presidential election, to meet the demands of the slavery party than at any previous time in their history. Never did parties come before the northern people with propositions of such undisguised contempt for the moral sentiment and the religious ideas of that people. They virtually asked them to unite in a war upon free speech, and upon conscience, and to drive the Almighty presence from the councils of the nation. Resting their platforms upon the fugitive slave bill, they boldly asked the people for political power to execute the horrible and hell-black provisions of that bill. The history of that election reveals, with great clearness, the extent to which slavery has shot its leprous distillment through the life-blood of the nation. The party most thoroughly opposed to the cause of justice and humanity, triumphed; while the party suspected of a leaning toward liberty, was overwhelmingly defeated, some say annihilated.

But here is a still more important fact, illustrating the designs of the slave power. It is a fact full of meaning, that no sooner did the democratic slavery party come into power, than a system of legislation was presented to the legislatures of the northern states, designed to put the states in harmony with the fugitive slave law, and the malignant bearing of the national government toward the colored inhabitants of the country. This whole movement on the part of the states, bears the evidence of having one origin, emanating from one head, and urged forward by one power. It was simultaneous, uniform, and general, and looked to one end. It was intended to put thorns under feet already bleeding; to crush a people already bowed down; to enslave a people already but half free; in a word, it was intended to discourage, dishearten, and drive the free colored people out of the country. In looking at the recent black law of Illinois, one is struck dumb with its enormity. It would seem that the men who enacted that law, had not only banished from their minds all sense of justice, but all sense of shame. It coolly proposes to sell the bodies and souls of the blacks to increase the intelligence and refinement of the whites; to rob every black stranger who ventures among them, to increase their literary fund.

While this is going on in the states, a pro-slavery, political board of health is established at Washington. Senators Hale, Chase, and Sumner are robbed of a part of their senatorial dignity and consequence as representing sovereign states, because they have refused to be inoculated with the slavery virus. Among the services which a senator is expected by his state to perform, are many that can only be done efficiently on committees; and, in saying to these honorable senators, you shall not serve on the committees of this body, the slavery party took the responsibility of robbing and insulting the states that sent them. It is an attempt at Washington to decide for the states who shall be sent to the senate. Sir, it strikes me that this aggression on the part of the slave power did not meet at the hands of the proscribed senators the rebuke which we had a right to expect would be administered. It seems to me that an opportunity was lost, that the great principle of senatorial equality was left undefended, at a time when its vindication was sternly demanded. But it is not to the purpose of my present statement to criticise the conduct of our friends. I am persuaded that much ought to be left to the discretion of anti slavery men in congress, and charges of recreancy should never be made but on the most sufficient grounds. For, of all the places in the world where an anti-slavery man needs the confidence and encouragement of friends, I take Washington to be that place.

Let me now call attention to the social influences which are operating and cooperating with the slavery party of the country, designed to contribute to one or all of the grand objects aimed at by that party. We see here the black man attacked in his vital interests; prejudice and hate are excited against him; enmity is stirred up between him and other laborers. The Irish people, warm-hearted, generous, and sympathizing with the oppressed everywhere, when they stand upon their own green island, are instantly taught, on arriving in this Christian country, to hate and despise the colored people. They are taught to believe that we eat the bread which of right belongs to them. The cruel lie is told the Irish, that our adversity is essential to their prosperity. Sir, the Irish-American will find out his mistake one day. He will find that in assuming our avocation he also has assumed our degradation. But for the present we are sufferers. The old employments by which we have heretofore gained our livelihood, are gradually, and it may be inevitably, passing into other hands. Every hour sees us elbowed out of some employment to make room perhaps for some newly-arrived emigrants, whose hunger and color are thought to give them a title to especial favor. White men are becoming

house-servants, cooks, and stewards, common laborers, and flunkeys to our gentry, and, for aught I see, they adjust themselves to their stations with all becoming obsequiousness. This fact proves that if we cannot rise to the whites, the whites can fall to us. Now, sir, look once more. While the colored people are thus elbowed out of employment; while the enmity of emigrants is being excited against us; while state after state enacts laws against us; while we are hunted down, like wild game, and oppressed with a general feeling of insecurity—the American colonization society—that old offender against the best interests and slanderer of the colored people—awakens to new life, and vigorously presses its scheme upon the consideration of the people and the government. New papers are started—some for the north and some for the south—and each in its tone adapting itself to its latitude. Government, state and national, is called upon for appropriations to enable the society to send us out of the country by steam! They want steamers to carry letters and Negroes to Africa. Evidently, this society looks upon our “extremity as its opportunity,” and we may expect that it will use the occasion well. They do not deplore, but glory, in our misfortunes.

But, sir, I must hasten. I have thus briefly given my view of one aspect of the present condition and future prospects of the colored people of the United States. And what I have said is far from encouraging to my afflicted people. I have seen the cloud gather upon the sable brows of some who hear me. I confess the case looks black enough. Sir, I am not a hopeful man. I think I am apt even to undercalculate the benefits of the future. Yet, sir, in this seemingly desperate case, I do not despair for my people. There is a bright side to almost every picture of this kind; and ours is no exception to the general rule. If the influences against us are strong, those for us are also strong. To the inquiry, will our enemies prevail in the execution of their designs. In my God and in my soul, I believe they _will not_. Let us look at the first object sought for by the slavery party of the country, viz: the suppression of anti slavery discussion. They desire to suppress discussion on this subject, with a view to the peace of the slaveholder and the security of slavery. Now, sir, neither the principle nor the subordinate objects here declared, can be at all gained by the slave power, and for this reason: It involves the proposition to padlock the lips of the whites, in order to secure the fetters on the limbs of the blacks. The right of speech, precious and priceless, _cannot, will not_, be surrendered to slavery. Its suppression is asked for, as I have said, to give peace and security to slaveholders. Sir, that thing cannot be done. God has interposed an insuperable obstacle to any such result. “There can be _no peace_, saith my God, to the wicked.” Suppose it were possible to put down this discussion, what would it avail the guilty slaveholder, pillowed as he is upon heaving bosoms of ruined souls? He could not have a peaceful spirit. If every anti-slavery tongue in the nation were silent—every anti-slavery organization dissolved—every anti-slavery press demolished—every anti slavery periodical, paper, book, pamphlet, or what not, were searched out, gathered, deliberately burned to ashes, and their ashes given to the four winds of heaven, still, still the slaveholder could have _“no peace_.” In every pulsation of his heart, in every throb of his life, in every glance of his eye, in the breeze that soothes, and in the thunder that startles, would be waked up an accuser, whose cause is, “Thou art, verily, guilty concerning thy brother.”

THE ANTI-SLAVERY MOVEMENT. Extracts from a Lecture before Various

Anti-Slavery Bodies, in the Winter of 1855.

A grand movement on the part of mankind, in any direction, or for any purpose, moral or political, is an interesting fact, fit and proper to be studied. It is such, not only for those who eagerly participate in it, but also for those who stand aloof from it—even for those by whom it is opposed. I take the anti-slavery movement to be such an one, and a movement as sublime and glorious in its character, as it is holy and beneficent in the ends it aims to accomplish. At this moment, I deem it safe to say, it is properly engrossing more minds in this country than any other subject now before the American people. The late John C. Calhoun—one of the mightiest men that ever stood up in the American senate—did not deem it beneath him; and he probably studied it as deeply, though not as honestly, as Gerrit Smith, or William Lloyd Garrison. He evinced the greatest familiarity with the subject; and the greatest efforts of his last years in the senate had direct reference to this movement. His eagle eye watched every new development connected with it; and he was ever prompt to inform the south of every important step in its progress. He never allowed himself to make light of it; but always spoke of it and treated it as a matter of grave import; and in this he showed himself a master of the mental, moral, and religious constitution of human society. Daniel Webster, too, in the better days of his life, before he gave his assent to the fugitive slave bill, and trampled upon all his earlier and better convictions—when his eye was yet single—he clearly comprehended the nature of the elements involved in this movement; and in his own majestic eloquence, warned the south, and the country, to have a care how they attempted to put it down. He is an illustration that it is easier to give, than to take, good advice. To these two men—the greatest men to whom the nation has yet given birth—may be traced the two great facts of the present—the south triumphant, and the north humbled. Their names may stand thus—Calhoun and domination—Webster and degradation. Yet again. If to the enemies of liberty this subject is one of engrossing interest, vastly more so should it be such to

freedom's friends. The latter, it leads to the gates of all valuable knowledge—philanthropic, ethical, and religious; for it brings them to the study of man, wonderfully and fearfully made—the proper study of man through all time—the open book, in which are the records of time and eternity.

Of the existence and power of the anti-slavery movement, as a fact, you need no evidence. The nation has seen its face, and felt the controlling pressure of its hand. You have seen it moving in all directions, and in all weathers, and in all places, appearing most where desired least, and pressing hardest where most resisted. No place is exempt. The quiet prayer meeting, and the stormy halls of national debate, share its presence alike. It is a common intruder, and of course has the name of being ungentlemanly. Brethren who had long sung, in the most affectionate fervor, and with the greatest sense of security,

Together let us sweetly live—together let us die,

have been suddenly and violently separated by it, and ranged in hostile attitude toward each other. The Methodist, one of the most powerful religious organizations of this country, has been rent asunder, and its strongest bolts of denominational brotherhood started at a single surge. It has changed the tone of the northern pulpit, and modified that of the press. A celebrated divine, who, four years ago, was for flinging his own mother, or brother, into the remorseless jaws of the monster slavery, lest he should swallow up the Union, now recognizes anti-slavery as a characteristic of future civilization. Signs and wonders follow this movement; and the fact just stated is one of them. Party ties are loosened by it; and men are compelled to take sides for or against it, whether they will or not. Come from where he may, or come for what he may, he is compelled to show his hand. What is this mighty force? What is its history? and what is its destiny? Is it ancient or modern, transient or permanent? Has it turned aside, like a stranger and a sojourner, to tarry for a night? or has it come to rest with us forever? Excellent chances are here for speculation; and some of them are quite profound. We might, for instance, proceed to inquire not only into the philosophy of the anti-slavery movement, but into the philosophy of the law, in obedience to which that movement started into existence. We might demand to know what is that law or power, which, at different times, disposes the minds of men to this or that particular object—now for peace, and now for war—now for freedom, and now for slavery; but this profound question I leave to the abolitionists of the superior class to answer. The speculations which must precede such answer, would afford, perhaps, about the same satisfaction as the learned theories which have rained down upon the world, from time to time, as to the origin of evil. I shall, therefore, avoid water in which I cannot swim, and deal with anti-slavery as a fact, like any other fact in the history of mankind, capable of being described and understood, both as to its internal forces, and its external phases and relations.

[After an eloquent, a full, and highly interesting exposition of the nature, character, and history of the anti-slavery movement, from the insertion of which want of space precludes us, he concluded in the following happy manner.]

Present organizations may perish, but the cause will go on. That cause has a life, distinct and independent of the organizations patched up from time to time to carry it forward. Looked at, apart from the bones and sinews and body, it is a thing immortal. It is the very essence of justice, liberty, and love. The moral life of human society, it cannot die while conscience, honor, and humanity remain. If but one be filled with it, the cause lives. Its incarnation in any one individual man, leaves the whole world a priesthood, occupying the highest moral eminence even that of disinterested benevolence. Whoso has ascended his height, and has the grace to stand there, has the world at his feet, and is the world's teacher, as of divine right. He may set in judgment on the age, upon the civilization of the age, and upon the religion of the age; for he has a test, a sure and certain test, by which to try all institutions, and to measure all men. I say, he may do this, but this is not the chief business for which he is qualified. The great work to which he is called is not that of judgment. Like the Prince of Peace, he may say, if I judge, I judge righteous judgment; still mainly, like him, he may say, this is not his work. The man who has thoroughly embraced the principles of justice, love, and liberty, like the true preacher of Christianity, is less anxious to reproach the world of its sins, than to win it to repentance. His great work on earth is to exemplify, and to illustrate, and to ingraft those principles upon the living and practical understandings of all men within the reach of his influence. This is his work; long or short his years, many or few his adherents, powerful or weak his instrumentalities, through good report, or through bad report, this is his work. It is to snatch from the bosom of nature the latent facts of each individual man's experience, and with steady hand to hold them up fresh and glowing, enforcing, with all his power, their acknowledgment and practical adoption. If there be but _one_ such man in the land, no matter what becomes of abolition societies and parties, there will be an anti-slavery cause, and an anti-slavery movement. Fortunately for that cause, and fortunately for him by whom it is espoused, it requires no extraordinary amount of talent to preach it or to receive it when preached. The grand secret of its power is, that each of its principles is easily rendered appreciable to the faculty of reason in man, and that the most unenlightened conscience has no difficulty in deciding on which side to register its testimony. It can call its preachers from among the fishermen, and raise them to

power. In every human breast, it has an advocate which can be silent only when the heart is dead. It comes home to every man's understanding, and appeals directly to every man's conscience. A man that does not recognize and approve for himself the rights and privileges contended for, in behalf of the American slave, has not yet been found. In whatever else men may differ, they are alike in the apprehension of their natural and personal rights. The difference between abolitionists and those by whom they are opposed, is not as to principles. All are agreed in respect to these. The manner of applying them is the point of difference.

The slaveholder himself, the daily robber of his equal brother, discourses eloquently as to the excellency of justice, and the man who employs a brutal driver to flay the flesh of his negroes, is not offended when kindness and humanity are commended. Every time the abolitionist speaks of justice, the anti-abolitionist assents says, yes, I wish the world were filled with a disposition to render to every man what is rightfully due him; I should then get what is due me. That's right; let us have justice. By all means, let us have justice. Every time the abolitionist speaks in honor of human liberty, he touches a chord in the heart of the anti-abolitionist, which responds in harmonious vibrations. Liberty—yes, that is evidently my right, and let him beware who attempts to invade or abridge that right. Every time he speaks of love, of human brotherhood, and the reciprocal duties of man and man, the anti-abolitionist assents—says, yes, all right—all true—we cannot have such ideas too often, or too fully expressed. So he says, and so he feels, and only shows thereby that he is a man as well as an anti-abolitionist. You have only to keep out of sight the manner of applying your principles, to get them endorsed every time. Contemplating himself, he sees truth with absolute clearness and distinctness. He only blunders when asked to lose sight of himself. In his own cause he can beat a Boston lawyer, but he is dumb when asked to plead the cause of others. He knows very well whatsoever he would have done unto himself, but is quite in doubt as to having the same thing done unto others. It is just here, that lions spring up in the path of duty, and the battle once fought in heaven is refought on the earth. So it is, so hath it ever been, and so must it ever be, when the claims of justice and mercy make their demand at the door of human selfishness. Nevertheless, there is that within which ever pleads for the right and the just.

In conclusion, I have taken a sober view of the present anti-slavery movement. I am sober, but not hopeless. There is no denying, for it is everywhere admitted, that the anti-slavery question is the great moral and social question now before the American people. A state of things has gradually been developed, by which that question has become the first thing in order. It must be met. Herein is my hope. The great idea of impartial liberty is now fairly before the American people. Anti-slavery is no longer a thing to be prevented. The time for prevention is past. This is great gain. When the movement was younger and weaker—when it wrought in a Boston garret to human apprehension, it might have been silently put out of the way. Things are different now. It has grown too large—its friends are too numerous—its facilities too abundant—its ramifications too extended—its power too omnipotent, to be snuffed out by the contingencies of infancy. A thousand strong men might be struck down, and its ranks still be invincible. One flash from the heart-supplied intellect of Harriet Beecher Stowe could light a million camp fires in front of the embattled host of slavery, which not all the waters of the Mississippi, mingled as they are with blood, could extinguish. The present will be looked to by after coming generations, as the age of anti-slavery literature—when supply on the gallop could not keep pace with the ever growing demand—when a picture of a Negro on the cover was a help to the sale of a book—when conservative lyceums and other American literary associations began first to select their orators for distinguished occasions from the ranks of the previously despised abolitionists. If the anti-slavery movement shall fail now, it will not be from outward opposition, but from inward decay. Its auxiliaries are everywhere. Scholars, authors, orators, poets, and statesmen give it their aid. The most brilliant of American poets volunteer in its service. Whittier speaks in burning verse to more than thirty thousand, in the National Era. Your own Longfellow whispers, in every hour of trial and disappointment, "labor and wait." James Russell Lowell is reminding us that "men are more than institutions." Pierpont cheers the heart of the pilgrim in search of liberty, by singing the praises of "the north star." Bryant, too, is with us; and though chained to the car of party, and dragged on amidst a whirl of political excitement, he snatches a moment for letting drop a smiling verse of sympathy for the man in chains. The poets are with us. It would seem almost absurd to say it, considering the use that has been made of them, that we have allies in the Ethiopian songs; those songs that constitute our national music, and without which we have no national music. They are heart songs, and the finest feelings of human nature are expressed in them. "Lucy Neal," "Old Kentucky Home," and "Uncle Ned," can make the heart sad as well as merry, and can call forth a tear as well as a smile. They awaken the sympathies for the slave, in which antislavery principles take root, grow, and flourish. In addition to authors, poets, and scholars at home, the moral sense of the civilized world is with us. England, France, and Germany, the three great lights of modern civilization, are with us, and every American traveler learns to regret the existence of slavery in his country. The growth of intelligence, the influence of commerce, steam, wind, and lightning are our allies. It would be easy to amplify this summary, and to swell the vast conglomeration of our material forces; but there is a deeper and truer method of measuring the power of our cause, and of comprehending its vitality. This is to be found in its accordance with the best elements of human nature. It is beyond the power of slavery to annihilate affinities recognized and established by the Almighty. The slave is bound to mankind by the

powerful and inextricable net-work of human brotherhood. His voice is the voice of a man, and his cry is the cry of a man in distress, and man must cease to be man before he can become insensible to that cry. It is the righteous of the cause—the humanity of the cause—which constitutes its potency. As one genuine bankbill is worth more than a thousand counterfeits, so is one man, with right on his side, worth more than a thousand in the wrong. “One may chase a thousand, and put ten thousand to flight.” It is, therefore, upon the goodness of our cause, more than upon all other auxiliaries, that we depend for its final triumph.

Another source of congratulations is the fact that, amid all the efforts made by the church, the government, and the people at large, to stay the onward progress of this movement, its course has been onward, steady, straight, unshaken, and unchecked from the beginning. Slavery has gained victories large and numerous; but never as against this movement—against a temporizing policy, and against northern timidity, the slave power has been victorious; but against the spread and prevalence in the country, of a spirit of resistance to its aggression, and of sentiments favorable to its entire overthrow, it has yet accomplished nothing. Every measure, yet devised and executed, having for its object the suppression of anti-slavery, has been as idle and fruitless as pouring oil to extinguish fire. A general rejoicing took place on the passage of “the compromise measures” of 1850. Those measures were called peace measures, and were afterward termed by both the great parties of the country, as well as by leading statesmen, a final settlement of the whole question of slavery; but experience has laughed to scorn the wisdom of pro-slavery statesmen; and their final settlement of agitation seems to be the final revival, on a broader and grander scale than ever before, of the question which they vainly attempted to suppress forever. The fugitive slave bill has especially been of positive service to the anti-slavery movement. It has illustrated before all the people the horrible character of slavery toward the slave, in hunting him down in a free state, and tearing him away from wife and children, thus setting its claims higher than marriage or parental claims. It has revealed the arrogant and overbearing spirit of the slave states toward the free states; despising their principles—shocking their feelings of humanity, not only by bringing before them the abominations of slavery, but by attempting to make them parties to the crime. It has called into exercise among the colored people, the hunted ones, a spirit of manly resistance well calculated to surround them with a bulwark of sympathy and respect hitherto unknown. For men are always disposed to respect and defend rights, when the victims of oppression stand up manfully for themselves.

There is another element of power added to the anti-slavery movement, of great importance; it is the conviction, becoming every day more general and universal, that slavery must be abolished at the south, or it will demoralize and destroy liberty at the north. It is the nature of slavery to beget a state of things all around it favorable to its own continuance. This fact, connected with the system of bondage, is beginning to be more fully realized. The slave-holder is not satisfied to associate with men in the church or in the state, unless he can thereby stain them with the blood of his slaves. To be a slave-holder is to be a propagandist from necessity; for slavery can only live by keeping down the under-growth morality which nature supplies. Every new-born white babe comes armed from the Eternal presence, to make war on slavery. The heart of pity, which would melt in due time over the brutal chastisements it sees inflicted on the helpless, must be hardened. And this work goes on every day in the year, and every hour in the day.

What is done at home is being done also abroad here in the north. And even now the question may be asked, have we at this moment a single free state in the Union? The alarm at this point will become more general. The slave power must go on in its career of exactions. Give, give, will be its cry, till the timidity which concedes shall give place to courage, which shall resist. Such is the voice of experience, such has been the past, such is the present, and such will be that future, which, so sure as man is man, will come. Here I leave the subject; and I leave off where I began, consoling myself and congratulating the friends of freedom upon the fact that the anti-slavery cause is not a new thing under the sun; not some moral delusion which a few years’ experience may dispel. It has appeared among men in all ages, and summoned its advocates from all ranks. Its foundations are laid in the deepest and holiest convictions, and from whatever soul the demon, selfishness, is expelled, there will this cause take up its abode. Old as the everlasting hills; immovable as the throne of God; and certain as the purposes of eternal power, against all hinderances, and against all delays, and despite all the mutations of human instrumentalities, it is the faith of my soul, that this anti-slavery cause will triumph.

FOOTNOTES

1 (return) [Letter, Introduction to _Life of Frederick Douglass_, Boston, 1841.]

2 (return) [One of these ladies, impelled by the same noble spirit which carried Miss Nightingale to Scutari, has devoted her time, her untiring energies, to a great extent her means, and her high literary abilities, to the advancement and support of Frederick Douglass’ Paper, the only organ of the downtrodden, edited and published by one of themselves, in the United States.]

3 (return) [Mr. Stephen Myers, of Albany, deserves mention as one of the most persevering among the colored editorial fraternity.]

4 (return) [The German physiologists have even discovered vegetable matter—starch—in the human body. See _Med. Chirurgical Rev_., Oct., 1854, p. 339.]

5 (return) [Mr. Wm. H. Topp, of Albany.]

6 (return) [This is the same man who gave me the roots to prevent my being whipped by Mr. Covey. He was “a clever soul.” We used frequently to talk about the fight with Covey, and as often as we did so, he would claim my success as the result of the roots which he gave me. This superstition is very common among the more ignorant slaves. A slave seldom dies, but that his death is attributed to trickery.]

7 (return) [He was a whole-souled man, fully imbued with a love of his afflicted and hunted people, and took pleasure in being to me, as was his wont, “Eyes to the blind, and legs to the lame.” This brave and devoted man suffered much from the persecutions common to all who have been prominent benefactors. He at last became blind, and needed a friend to guide him, even as he had been a guide to others. Even in his blindness, he exhibited his manly character. In search of health, he became a physician. When hope of gaining is(sic) own was gone, he had hope for others. Believing in hydropathy, he established, at Northampton, Massachusetts, a large _“Water Cure,”_ and became one of the most successful of all engaged in that mode of treatment.]

8 (return) [The following is a copy of these curious papers, both of my transfer from Thomas to Hugh Auld, and from Hugh to myself:

“Know all men by these Presents, That I, Thomas Auld, of Talbot county, and state of Maryland, for and in consideration of the sum of one hundred dollars, current money, to me paid by Hugh Auld, of the city of Baltimore, in the said state, at and before the sealing and delivery of these presents, the receipt whereof, I, the said Thomas Auld, do hereby acknowledge, have granted, bargained, and sold, and by these presents do grant, bargain, and sell unto the said Hugh Auld, his executors, administrators, and assigns, ONE NEGRO MAN, by the name of FREDERICK BAILY, or DOUGLASS, as he callls(sic) himself—he is now about twenty-eight years of age—to have and to hold the said negro man for life. And I, the said Thomas Auld, for myself my heirs, executors, and administrators, all and singular, the said FREDERICK BAILY _alias_ DOUGLASS, unto the said Hugh Auld, his executors, administrators, and assigns against me, the said Thomas Auld, my executors, and administrators, and against ali and every other person or persons whatsoever, shall and will warrant and forever defend by these presents. In witness whereof, I set my hand and seal, this thirteenth day of November, eighteen hundred and forty-six.

THOMAS AULD

“Signed, sealed, and delivered in presence of Wrightson Jones.

“JOHN C. LEAS.

The authenticity of this bill of sale is attested by N. Harrington, a justice of the peace of the state of Maryland, and for the county of Talbot, dated same day as above.

“To all whom it may concern: Be it known, that I, Hugh Auld, of the city of Baltimore, in Baltimore county, in the state of Maryland, for divers good causes and considerations, me thereunto moving, have released from slavery, liberated, manumitted, and set free, and by these presents do hereby release from slavery, liberate, manumit, and set free, MY NEGRO MAN, named FREDERICK BAILY, otherwise called DOUGLASS, being of the age of twenty-eight years, or thereabouts, and able to work and gain a sufficient livelihood and maintenance; and him the said negro man named FREDERICK BAILY, otherwise called FREDERICK DOUGLASS, I do declare to be henceforth free, manumitted, and discharged from all manner of servitude to me, my executors, and administrators forever.

“In witness whereof, I, the said Hugh Auld, have hereunto set my hand and seal the fifth of December, in the year one thousand eight hundred and forty-six.

Hugh Auld

“Sealed and delivered in presence of T. Hanson Belt.

“JAMES N. S. T. WRIGHT”]

9 (return) [See Appendix to this volume, page 317.]

10 (return) [Mr. Douglass' published speeches alone, would fill two volumes of the size of this. Our space will only permit the insertion of the extracts which follow; and which, for originality of thought, beauty and force of expression, and for impassioned, indignatory eloquence, have seldom been equaled.]

11 (return) [It is not often that chattels address their owners. The following letter is unique; and probably the only specimen of the kind extant. It was written while in England.]

SKETCHES OF THE FAIR SEX,

IN ALL PARTS OF THE WORLD.

TO WHICH ARE ADDED RULES FOR DETERMINING THE PRECISE FIGURE, THE DEGREE OF BEAUTY, THE HABITS, AND THE AGE OF WOMEN,

NOTWITHSTANDING THE AIDS AND DISGUISE OF DRESS.

BOSTON: THEODORE ABBOT, 388 WASHINGTON ST.

1841.

Entered according to act of congress, in the year 1841, by

THEODORE ABBOT,

in the Clerk's Office of the District Court of Massachusetts.

In the following Pages,

It is our design to present a pleasing and interesting miscellany, which will serve to beguile the leisure hour, and will at the same time couple instruction with amusement. We have used but little method in the arrangement: Choosing rather to furnish the reader with a rich profusion of narratives and anecdotes, all tending to illustrate the

FEMALE CHARACTER,

to display its delicacy, its sweetness, its gentle or sometimes heroic virtues, its amiable weaknesses, and strange defects--than to attempt an accurate analysis of the hardest subject man ever attempted to master, viz--WOMAN.

It will be seen that we do not set down Woman as a cipher in the account of human beings. We accord to her her full share of importance in the world, and we have not attempted to relieve her from a sense of her responsibility as an accountable being. Above all, we have not failed to impress upon her the obligations she is under to CHRISTIANITY, whose benign influences have raised her to be the companion and bosom-friend of man, instead of his mere handmaid and dependant. It is religion that must form such a character as the following, which though applied by Pope to one of the most accomplished women of his time, is that of a CHRISTIAN WIFE in every age and station,--

"Oh! blest with temper whose unclouded ray Can make tomorrow cheerful as to-day: She who can love a sister's charms, or hear Sighs for a daughter with unwounded ear; She who ne'er answers till a husband cools, Or, if she rules him, never shows she rules; Charms by accepting--by submitting sways, Yet has her humor most, when she obeys."

By causing the character of woman to be more thoroughly discussed and better understood;--by making it more frequently the theme of rational meditation to the young and ardent, who, from the force of defective education, are apt to regard all "the sex," beyond a very limited circle, as mere accessaries to animal enjoyment,--whose peace they may wound without compunction, and whose happiness they may peril without reflection,--we feel that we shall do both sexes a good service, and one for which as they advance in life, and in their turn become husbands, wives and parents, they will thank our little book, as having helped them to

know themselves and each other.

TABLE OF CONTENTS.

African Women, 43 Adultery, punishment of 155 Bathing at Rome, 31 Betrothing and Marriage, 104 Chinese Women, 40 Chinese Bridegroom, 41 Caesar, Anecdote of 157 Celibacy of the Clergy, 160 Cleopatra, Death of, 199 Courts of Love, 172 Courtship, ancient Swedish 176 Courtship, Grecian 165 Courtship, Eastern 168 Condition of Women in the 8th Century, 52 Egyptian Women, Ancient 13 Egyptian Women, Modern 15 Euthira, desperate act of 162 Eastern Women, 37 English Women, 62 First Woman, 9 Female Friendship, 109 Female Delicacy, 30 French Women, 53 French Girls, 55 Female Simplicity, 71 Female Inferiority, idea of 67 Females during the age of Chivalry, 48 First Kiss of Love, 198 Grecian Women, 19 German Women, 99 Grecian Courtezans, 20 Greeks, religious festivals of 180 Grecian Ladies, luxurious dress of 164 Girls sold at Auction, 153 Husbands, on the choice of 114 Italian Women, 57 Influence of female society, 83 Immodesty at Babylon, 173 Indecency at Adrianople, 175 Lucretia and Virginia, 182 Ladies of Lapland and Greenland, 177 Matrimony, an essay on 203 Matrimony among the French 55 Matrimony in three different lights, 103 Magnanimity of Women, 77 Monastic Life, 89 Marriage Brokers at Genoa, 60 Marrying, power of 159 Noah's three sons, 43 Nuptial Ceremonies, 66 On looking at the picture of a beautiful female, 183 Persian Women, 17 Philtres and charms, power of 167 Roman Women, 24 Roman Oppian Law, 29 Russian Women, 65 Spanish Women, 60 St. Valentine's Day, 171 Sentimental Attachment, 92 Sale of a wife, 154 Saxons and Danes, long hair of 170 Venus de Medici, 194 Women, Art of determining the figure, beauty, habits, and the age of 185 Women in the Patriarchal ages, 10 Woman in Savage Life, 32 Woman in times of Chivalry, 45 Women in Asia and Africa, 79

"Sketches indeed, from that most passionate page, A woman's heart, of feelings, thoughts, that make The atmosphere in which her spirit moves; But like all other earthly elements, O'ercast with clouds; now dark, now touched with light, With rainbows, sunshine, showers, moonlight, stars, Chasing each other's change. I fain would trace Its brightness and its blackness."

SKETCHES OF "THE SEX."

THE FIRST WOMAN, AND HER ANTEDILUVIAN DESCENDANTS.

The great Creator, having formed man of the dust of the earth, "made a deep sleep to fall upon him, and took one of his ribs, and closed up the flesh instead thereof. And the rib, which the Lord God had taken from man, made he a woman, and brought her unto the man." Hence the fair sex, in the opinion of some authors, being formed of matter doubly refined, derive their superior beauty and excellence.

Not long after the creation, the first woman was tempted by the serpent to eat of the fruit of a certain tree, in the midst of the garden of Eden, with regard to which God had said, "Ye shall not eat of it, neither shall ye touch it, lest ye die."

This deception, and the fatal consequences arising from it, furnish the most interesting story in the whole history of the sex.

On the offerings being brought, and that of Abel accepted, Cain's jealousy and resentment rose to such a pitch, that, as soon as they came down from the mount where they had been sacrificing, he fell upon his brother and slew him.

For this cruel and barbarous action, Cain and his posterity, being banished from the rest of the human race, indulged themselves in every species of wickedness. On this account, it is supposed, they were called the _Sons and Daughters of Men_. The posterity of Seth, on the other hand, became eminent for virtue, and a regard to the divine precepts. By their regular and amiable conduct, they acquired the appellation of _Sons and Daughters of God_.

After the deluge there is a chasm in the history of women, until the time of the patriarch Abraham. They then begin to be introduced into the sacred story. Several of their actions are recorded. The laws, customs, and usages, by which they were governed, are frequently exhibited.

WOMAN IN THE PATRIARCHAL AGES.

The condition of women among the ancient patriarchs, appears to have been but extremely indifferent. When Abraham entertained the angels, sent to denounce the destruction of Sodom, he seems to have treated his wife as a menial servant: "Make ready quickly," said he to her, "three measures of fine meal, knead it, and make cakes on the hearth."

In many parts of the east, water is only to be met with deep in the earth, and to draw it from the wells is, consequently, fatiguing and laborious. This, however, was the task of the daughters of Jethro the Midianite; to whom so little regard was paid, either on account of their sex, or the rank of their father, as high priest of the country, that the neighboring shepherds not only insulted them, but forcibly took from them the water they had drawn.

This was the task of Rebecca, who not only drew water for Abraham's servant, but for his camels also, while the servant stood an idle spectator of the toil. Is it not natural to imagine, that, as he was on an embassy to court the damsel for Isaac, his master's son, he would have exerted his utmost efforts to please, and become acceptable?

When he had concluded his bargain, and was carrying her home, we meet with a circumstance worthy of remark. When she first approached Isaac, who had walked out into the fields to meet her, she did it in the most submissive manner, as if she had been approaching a lord and master, rather than a fond and passionate lover. From this circumstance, as well as from several others, related in the sacred history, it would seem that women, instead of endeavoring, as in modern times, to persuade the world that they confer an immense favor on a lover, by deigning to accept of him, did not scruple to confess, that the obligation was conferred on themselves.

This was the case with Ruth, who had laid herself down at the feet of Boaz; and being asked by him who she was, answered, "I am Ruth, thine handmaid; spread, therefore, thy skirt over thine handmaid, for thou art a near kinsman."

When Jacob went to visit his uncle Laban, he met Rachel, Laban's daughter, in the fields, attending on the flocks of her father.

In a much later period, Tamar, one of the daughters of king David, was sent by her father to perform the servile office of making cakes for her brother Amnon.

The simplicity of the times in which these things happened, no doubt, very much invalidates the strength of the conclusions that naturally arise from them. But, notwithstanding, it still appears that women were not then treated with the delicacy which they have experienced among people more polished and refined.

Polygamy also prevailed; which is so contrary to the inclination of the sex, and so deeply wounds the delicacy of their feelings, that it is impossible for any woman voluntarily to agree to it, even where it is authorized by custom and by law. Wherever, therefore, polygamy takes place, we may assure ourselves that women have but little authority, and have scarcely arrived at any consequence in society.

WOMEN OF ANCIENT EGYPT.

Wherever the human race live solitary, and unconnected with each other, they are savage and barbarous. Wherever they associate together, that association produces softer manners and a more engaging deportment.

The Egyptians, from the nature of their country, annually overflowed by the Nile, had no wild beasts to hunt, nor could they procure any thing by fishing. On these accounts, they were under a necessity of applying themselves to agriculture, a kind of life which naturally brings mankind together, for mutual convenience and assistance.

They were, likewise, every year, during the inundation of the river, obliged to assemble together, and take shelter, either on the rising grounds, or in the houses, which were raised upon piles, above the reach of the waters. Here, almost every employment being suspended, and the men and women long confined together, a thousand inducements, not to be found in a solitary state, would naturally prompt them to render themselves agreeable to each other. Hence their manners would begin, more early, to assume a softer polish, and more elegant refinement, than those of the other nations who surrounded them.

The practice of confining women, instituted by jealousy, and maintained by unlawful power, was not adopted by the ancient Egyptians. This appears from the story of Pharaoh's daughter, who was going with her train of maids to bathe in the river, when she found Moses hid among the reeds. It is still more evident, from that of the wife of Potiphar, who, if she had been confined, could not have found the opportunities she did, to solicit Joseph to her adulterous embrace.

The queens of Egypt had the greatest attention paid to them. They were more readily obeyed than the kings. It is also related, that the husbands were in their marriage-contracts, obliged to promise obedience to their wives; an obedience, which, in our modern times, we are often obliged to perform, though our wives entered into the promise.

The behavior of Solomon to Pharaoh's daughter is a convincing proof that more honor and respect was paid to the Egyptian women, than to those of any other people. Solomon had many other wives besides this princess, and was married to several of them before her, which, according to the Jewish law, ought to have entitled them to a preference. But, notwithstanding this, we hear of no particular palace having been built for any of the others, nor of the worship of any of their gods having been introduced into Jerusalem. But a magnificent palace was erected for Pharaoh's daughter; and she was permitted, though expressly contrary to the laws of Israel, to worship the gods of her own country.

MODERN EGYPTIAN WOMEN.

The women of modern Egypt are far from being on so respectable a footing as they were in ancient times, or as the European women are at present.

In Europe, women act parts of great consequence, and often reign sovereigns on the world's vast theatre. They influence manners and morals, and decide on the most important events. The fate of nations is frequently in their hands.

How different is their situation in Egypt! There they are bound down by the fetters of slavery, condemned to servitude, and have no influence in public affairs. Their empire is confined within the walls of the Harem. There are their graces and charms entombed. The circle of their life extends not beyond their own family and domestic duties.

Their first care is to educate their children; and a numerous posterity is their most fervent wish. Mothers always suckle their children. This is expressly commanded by Mahomet:--"Let the mother suckle her child full two years, if the child does not quit the breast; but she shall be permitted to wean it, with the consent of her husband."

The harem is the cradle and school of infancy. The new born feeble being is not there swaddled and filletted up in a swathe, the source of a thousand diseases. Laid naked on a mat, exposed in a vast chamber to the pure air, he breathes freely, and with his delicate limbs sprawls at pleasure.

The daughter's education is the same. Whalebone and husks, which martyr European girls, they know not. They are only covered with a shift until six years old: and the dress they afterwards wear confines none of their limbs, but suffers the body to take its true form; and nothing is more uncommon than ricketty children, and crooked people. In Egypt, man rises in all his majesty, and woman displays every charm of person.

The Egyptian women, once or twice a week, are permitted to go to the bath, and visit female relations and friends. They receive each other's visits very affectionately. When a lady enters the harem, the mistress rises, takes her hand, presses it to her bosom, kisses, and makes her sit down by her side; a slave hastens to take her black mantle; she is entreated to be at ease, quits her veil, and discovers a floating robe tied round her waist with a sash, which perfectly displays her shape. She then receives compliments according to their manner: "Why, my mother, or my sister, have you been so long absent? We sighed to see you! Your presence is an honor to our house! It is the happiness of our lives!"

Slaves present coffee, sherbet, and confectionary. They laugh, talk and play. A large dish is placed on the sofa, on which are oranges, pomegranates, bananas, and excellent melons. Water, and rose-water mixed, are brought in an ewer, and with them a silver bason to wash the hands; and loud glee and merry conversation season the meal. The chamber is perfumed by wood of aloes, in a brazier; and, the repast ended, the slaves dance to the sound of cymbals, with whom the mistresses often mingle. At parting they several times repeat, "God keep you in health! Heaven grant you a numerous offspring! Heaven preserve your children; the delight and glory of your family!"

When a visitor is in the harem, the husband must not enter. It is the asylum of hospitality, and cannot be violated without fatal consequences; a cherished right, which the Egyptian women carefully maintain, being interested in its preservation. A lover, disguised like a woman, may be introduced into the harem, and it is necessary he should remain undiscovered; death would otherwise be his reward. In that country, where the passions are excited by the climate, and the difficulty of gratifying them is great, love often produces tragical events.

PERSIAN WOMEN.

Several historians, in mentioning the ancient Persians, have dwelt with peculiar severity on the manner in which they treated their women. Jealous, almost to distraction, they confined the whole sex with the strictest attention, and could not bear that the eye of a

stranger should behold the beauty whom they adored.

When Mahomet, the great legislator of the modern Persians, was just expiring, the last advice that he gave to his faithful adherents, was, "Be watchful of your religion, and your wives." Hence they pretend to derive not only the power of confining, but also of persuading them, that they hazard their salvation, if they look upon any other man besides their husbands. The Christian religion informs us, that in the other world they neither marry, nor are given in marriage. The religion of Mahomet teaches us a different doctrine, which the Persians believing, carry the jealousy of Asia to the fields of Elysium, and the groves of Paradise; where, according to them, the blessed inhabitants have their eyes placed on the crown of their heads, lest they should see the wives of their neighbors.

To offer the least violence to a Persian woman, was to incur certain death from her husband or guardian. Even their kings, though the most absolute in the universe, could not alter the manners or customs of the country, which related to the fair sex.

Widely different from this is the present state of Persia. By a law of that country, their monarch is now authorized to go, whenever he pleases, into the harem of any of his subjects; and the subject, on whose prerogative he thus encroaches, so far from exerting his usual jealousy, thinks himself highly honored by such a visit.

A laughable story, on this subject, is told of Shah Abbas, who having got drunk at the house of one of his favorites, and intending to go into the apartment of his wives, was stopped by the door-keeper, who bluntly told him, "Not a man, sir, besides my master, shall put a mustachio here, so long as I am porter." "What," said the king, "dost thou not know me?" "Yes," answered the fellow, "I know that you are king of the men, but not of the women."

GRECIAN WOMEN.

Woman, in ancient Greece, seems to have been regarded merely in the light of an instrument for raising up members of the state. And surely it may be said of them that they nobly fulfilled this duty. The catalogue of heroes and sages which shine in Grecian history bright and numerous as stars in the firmament, are so many testimonials to the faithfulness of Grecian women in this respect.

The sexes were but little society for each other. Even husbands were, in Sparta, limited as to the time and duration of the visits made to their wives.

That women in ancient Greece did not enjoy that delicate consideration which other refined nations accord to their sex, may be inferred from the inferiority of the apartments allotted to them. The famous Helen is said to have had her chamber in the attic; and Penelope, the queen of Ulysses, descended from hers by a ladder.

GRECIAN COURTEZANS.

The rank which the courtezans enjoyed, even in the brightest ages of Greece, and particularly at Athens, is one of the greatest singularities in the manners of any people. By what circumstances could that order of women, who debase at once their own sex and ours--in a country where the women were possessed of modesty, and the men of sentiment, arrive at distinction, and sometimes even at the highest degree of reputation and consequence? Several reasons may be assigned for that phenomenon in society.

In Greece, the courtezans were in some measure connected with the religion of the country. The Goddess of Beauty had her altars; and she was supposed to protect prostitution, which was to her a species of worship. The people invoked Venus in times of danger; and, after a battle, they thought they had done honor to Miltiades and Themistocles, because the Laises and the Glyceras of the age had chaunted hymns to their Goddess.

The courtezans were likewise connected with religion, by means of the arts. Their persons afforded models for statues, which were afterwards adored in the temples. Phryne served as a model to Praxiteles, for his Venus of Cnidus. During the feasts of Neptune, near Eleusis, Apelles having seen the same courtezan on the sea-shore, without any other veil than her loose and flowing hair, was so much struck with her appearance, that he borrowed from it the idea of his Venus rising from the waves.

They were, therefore connected with statuary and painting, as they furnished the practisers of those arts with the means of embellishing their works.

The greater part of them were skilled in music; and, as that art was attended with higher effects in Greece than it ever was in any other country, it must have possessed, in their hands, an irresistible charm.

Every one knows how enthusiastic the Greeks were of beauty. They adored it in the temples. They admired it in the principal works of art. They studied it in the exercises and the games. They thought to perfect it by their marriages. They offered rewards to it at the public festivals. But virtuous beauty was seldom to be seen. The modest women were confined to their own apartments, and were visited only by their husbands and nearest relations. The courtezans offered themselves every where to view; and their beauty as might be expected, obtained universal homage.

Greece was governed by eloquent men; and the celebrated courtezans, having an influence over those orators must have had an influence on public affairs. There was not one, not even the thundering, the inflexible Demosthenes, so terrible to tyrants, but was subjected to their sway. Of that great master of eloquence it has been said, "What he had been a whole year in erecting, a woman overturned in a day." That influence augmented their consequence; and their talent of pleasing increased with the occasions of exerting it.

The laws and the public institutions, indeed, by authorizing the privacy of women, set a high value on the sanctity of the marriage vow. But in Athens, imagination, sentiment, luxury, the taste in arts and pleasures, was opposite to the laws. The courtezans, therefore may be said to have come in support of the manners.

There was no check upon public licentiousness; but private infidelity, which concerned the peace of families, was punished as a crime. By a strange and perhaps unequalled singularity the men were corrupted, yet the domestic manners were pure. It seems as if the courtezans had not been considered to belong to their sex; and, by a convention to which the laws and the manners bended, while other women were estimated merely by their virtues, they were estimated only by their accomplishments.

These reasons will in some measure, account for the honors, which the votaries of Venus so often received in Greece. Otherwise we should have been at a loss to conceive, why six or seven writers had exerted their talents to celebrate the courtezans of Athens--why three great painters had uniformly devoted their pencils to represent them on canvass--and why so many poets had strove to immortalize them in verses. We should hardly have believed that so many illustrious men had courted their society--that Aspasia had been consulted in deliberations of peace and war--that Phryne had a statue of gold placed between the statues of two kings at Delphos--that, after death, magnificent tombs had been erected to their memory.

"The traveller," says a Greek writer, "who, approaching to Athens, sees on the side of the way a monument which attracts his notice at a distance, will imagine that it is the tomb of Miltiades or Pericles, or of some other great man, who has done honor to his country by his services. He advances, he reads, and he learns that it is a courtezan of Athens who is interred with so much pomp."

Theopompus, in a letter to Alexander the Great, speaks also of the same monument in words to the following effect--"Thus, after her death, is a prostitute honored; while not one of those brave warriors who fell in Asia, fighting for you, and for the safety of Greece, has so much as a stone erected to his memory, or an inscription to preserve his ashes from insult."

Such was the homage which that enthusiastic people, voluptuous and passionate, paid to beauty. More guided by sentiment than reason, and having laws rather than principles, they banished their great men, honored their courtezans, murdered Socrates, permitted themselves to be governed by Aspasia, preserved inviolate the marriage bed, and placed Phryne in the temple of Apollo!

ROMAN WOMEN.

Among the Romans, a grave and austere people, who, during five hundred years, were unacquainted with the elegancies and the pleasures of life, and who, in the middle of furrows and fields of battle, were employed in tillage or in war, the manners of the women were a long time as solemn and severe as those of the men, and without the smallest mixture of corruption, or of weakness.

The time when the Roman women began to appear in public, marks a particular era in history.

The Roman women, for many ages, were respected over the whole world. Their victorious husbands re-visited them with transport, at their return from battle. They laid at their feet the spoils of the enemy, and endeared themselves in their eyes by the wounds which they had received for them and for the state. Those warriors often came from imposing commands upon kings, and in their own houses accounted it an honor to obey. In vain the too rigid laws made them the arbiters of life and death. More powerful than the laws, the women ruled their judges. In vain the legislature, foreseeing the wants which exist only among a corrupt people, permitted divorce. The indulgence of the polity was proscribed by the manners.

Such was the influence of beauty at Rome before the licentious intercourse of the sexes had corrupted both.

The Roman matrons do not seem to have possessed that military courage which Plutarch has praised in certain Greek and barbarian women; they partook more of the nature of their sex; or, at least, they departed less from its character. Their first quality was decency. Every one knows the story of Cato the censor, _who stabbed a Roman Senator for kissing his own wife in the presence of his daughter_.

To these austere manners, the Roman women joined an enthusiastic love of their country, which discovered itself upon many great occasions. On the death of Brutus, they all clothed themselves in mourning. In the time of Coriolanus they saved the city. That incensed warrior who had insulted the senate and priests, and who was superior even to the pride of pardoning, could not resist the tears and entreaties of the women. _They_ melted his obdurate heart. The senate decreed them public thanks, ordered the men to give place to them upon all occasions, caused an altar to be erected for them on the spot where the mother had softened her son, and the wife her husband; and the sex were permitted to add another ornament to their head-dress.

The Roman women saved the city a second time, when besieged by Brennus. They gave up all their gold as its ransom. For that instance of their generosity, the senate granted them the honor of having funeral orations pronounced in the rostrum, in common with patriots and heroes.

After the battle of Cannae, when Rome had no other treasures but the virtues of her citizens, the women sacrificed both their jewels and their gold. A new decree rewarded their zeal.

Valerius Maximus who lived in the reign of Tiberius, informs us that, in the second triumvirate, the three assassins who governed Rome thirsting after gold, no less than blood, and having already practised every species of robbery, and worn out every method of plunder; resolved _to tax the women_. They imposed a heavy contribution upon each of them. The women sought an orator to defend their cause, but found none. Nobody would reason against those who had the power of life and death. The daughter of the celebrated Hortensius alone appeared. She revived the memory of her father's abilities, and supported with intrepidity her own cause and that of her sex. The ruffians blushed and revoked their orders.

Hortensia was conducted home in triumph, and had the honor of having given, in one day, an example of courage to men, a pattern of eloquence to women, and a lesson of humanity to tyrants.

During upwards of six hundred years, the _virtues_ had been found sufficient to please. They now found it necessary to call in the _accomplishments_. They were desirous to join admiration to esteem, 'till they learned to exceed esteem itself. For in all countries, in proportion as the love of virtue diminishes, we find the love of talents to increase.

A thousand causes concurred to produce this revolution of manners among the Romans. The vast inequality of ranks, the enormous fortunes of individuals, the ridicule, affixed by the imperial court to moral ideas, all contributed to hasten the period of corruption.

There were still, however, some great and virtuous characters among the Roman women. Portia, the daughter of Cato, and wife of Brutus, showed herself worthy to be associated with the first of human kind, and trusted with the fate of empires. After the battle of Phillippi, she would neither survive liberty nor Brutus, but died with the bold intrepidity of Cato.

The example of Portia was followed by that of Arria, who seeing her husband hesitating and afraid to die, in order to encourage him, pierced her own breast, and delivered to him the dagger with a smile.

Paulinia too, the wife of Seneca, caused her veins to be opened at the same time with her husband's, but being forced to live, during the few years which she survived him, "she bore in her countenance," says Tacitus, "the honorable testimony of her love, a _paleness_, which proved that part of her blood had sympathetically issued with the blood of her spouse."

To take notice of all the celebrated women of the empire, would much exceed the bounds of the present undertaking. But the empress Julia the wife of Septimius Severus, possessed a species of merit so very different from any of those already mentioned, as to claim particular attention.

This lady was born in Syria, and a daughter of a priest of the sun. It was predicted that she would rise to sovereign dignity; and her character justified the prophecy.

Julia, while on the throne, loved, or pretended passionately to love, letters. Either from taste, from a desire to instruct herself, from a love of renown, or possibly from all these together, she spent her life with philosophers. Her rank of empress would not, perhaps, have been sufficient to subdue those bold spirits; but she joined to that the more powerful influences of wit and beauty. These three kinds of empire rendered less necessary to her that which consists only in art; and which, attentive to their tastes and their weaknesses, govern great minds by little means.

It is said she was a philosopher. Her philosophy, however, did not extend so far as to give chastity to her manners. Her husband, who did not love her, valued her understanding so much, that he consulted her upon all occasions. She governed in the same manner under his son.

Julia was, in short, an empress and a politician, occupied at the same time about literature, and affairs of state, while she mingled her pleasures freely with both. She had courtiers for her lovers, scholars for her friends, and philosophers for her counsellors. In the midst of a society, where she reigned and was instructed. Julia arrived at the highest celebrity; but as among all her excellencies, we find not those of her sex, the virtues of a woman, our admiration is lost in blame. In her life time she obtained more praise than respect; and posterity, while it has done justice to her talents and her accomplishments, has agreed to deny her esteem.

LAWS AND CUSTOMS RESPECTING THE ROMAN WOMEN.

The Roman women, as well as the Grecian, were under perpetual guardianship; and were not at any age, nor in any condition, ever trusted with the management of their own fortunes.

Every father had power of life and death over his own daughters: but this power was not restricted to daughters only; it extended also to sons.

The Oppian law prohibited women from having more than half an ounce of gold employed in ornamenting their persons, from wearing clothes of divers colors, and from riding in chariots, either in the city, or a thousand paces round it.

They were strictly forbid to use wine, or even to have in their possession the key of any place where it was kept. For either of these faults they were liable to be divorced by their husbands. So careful were the Romans in restraining their women from wine, that they are supposed to have first introduced the custom of saluting their female relations and acquaintances, on entering the house of a friend or neighbor, that they might discover by their breath, whether they had tasted any of that liquor.

This strictness, however, began in time to be relaxed; until at last, luxury becoming too strong for every law, the women indulged themselves in equal liberties with the men.

But such was not the case in the earlier ages of Rome. Romulus even permitted husbands to kill their wives, if they found them drinking wine.

Fabius Pictor relates, that the parents of a Roman lady, having detected her picking the lock of a chest which contained some wine, shut her up and starved her to death.

Women were liable to be divorced by their husbands almost at pleasure, provided the portion was returned which they had brought along with them. They were also liable to be divorced for barrenness, which, if it could be construed into a fault, was at least the fault of nature, and might sometimes be that of the husband.

A few sumptuary laws, a subordination to the men, and a total want of authority, do not so much affect the sex, as to be coldly and indelicately treated by their husbands.

Such a treatment is touching them in the tenderest part. Such, however we have reason to believe, they often met with from the Romans, who had not learned, as in modern times to blend the rigidity of the patriot, and roughness of the warrior, with that soft and indulging behavior, so conspicuous in our modern patriots and heroes.

Husbands among the Romans not only themselves behaved roughly to their wives, but even sometimes permitted their servants and slaves to do the same. The principal eunuch of Justinian the Second, threatened to chastise the Empress, his master's wife, in the manner that children are chastised at school, if she did not obey his orders.

With regard to the private diversions of the Roman ladies, history is silent. Their public ones, were such as were common to both sexes; as bathing, theatrical representations, horse-races, shows of wild beasts, which fought against one another, and sometimes

against men, whom the emperors, in the plenitude of their despotic power, ordered to engage them.

The Romans, of both sexes, spent a great deal of time at the baths; which at first, perhaps, were interwoven with their religion, but at last were only considered as refinements in luxury. They were places of public resort, where people met with their acquaintances and friends, where public libraries were kept for such as chose to read, and where poets recited their works to such as had patience to hear.

In the earlier periods of Rome, separate baths were appropriated to each sex. Luxury, by degrees getting the better of decency, the men and women at last bathed promiscuously together. Though this indecent manner of bathing was prohibited by the emperor Adrian; yet, in a short time, inclination overcame the prohibition; and, in spite of every effort, promiscuous bathing continued until the time of Constantine, who, by the coercive force of the legislative authority, and the rewards and terrors of the Christian religion, put a final stop to it.

WOMAN IN SAVAGE LIFE.

Man, in a state of barbarity, equally cruel and indolent, active by necessity, but naturally inclined to repose, is acquainted with little more than the physical effects of love; and having none of those moral ideas which only can soften the empire of force, he is led to consider it as his supreme law, subjecting to his despotism those whom reason had made his equals, but whose imbecility betrayed them to his strength.

Cast in the lap of naked nature, and exposed to every hardship, the forms of women, in savage life, are but little engaging. With nothing that deserves the name of culture, their latent qualities, if they have any, are like the diamond, while enclosed in the rough flint, incapable of shewing any lustre. Thus destitute of every thing by which they can excite love, or acquire esteem; destitute of beauty to charm, or art to soothe, the tyrant man; they are by him destined to perform every mean and servile office. In this the American and other savage women differ widely from those of Asia, who, if they are destitute of the qualifications necessary for gaining esteem, have beauty, ornaments, and the art of exciting love.

In civilized countries a woman acquires some power by being the mother of a numerous family, who obey her maternal authority, and defends her honor and her life. But, even as a mother, a female savage has not much advantage. Her children, daily accustomed to see their father treat her nearly as a slave, soon begin to imitate his example, and either pay little regard to her authority or shake it off altogether.

Of this the Hottentot boys afford a remarkable proof. They are brought up by the women, till they are about fourteen years of age. Then, with several ceremonies they are initiated into the society of men. After this initiation is over it is reckoned manly for a boy to take the earliest opportunity of returning to the hut of his mother, and beating her in the most barbarous manner, to show that he is now out of her jurisdiction. Should the mother complain to the men, they would only applaud the boy for showing so laudable a contempt for the society and authority of women.

In the Brazils, the females are obliged to follow their husbands to war, to supply the place of beasts of burden, and to carry on their backs their children, provisions, hammocks, and every thing wanted in the field.

In the Isthmus of Darien, they are sent along with warriors and travellers, as we do baggage horses. Even their Queen appeared before some English gentlemen, carrying her sucking child, wrapt in a red blanket.

The women among the Indians of America are what the Helots were among the Spartans, a vanquished people obliged to toil for their conquerors. Hence on the banks of the Oroonoko we have heard of mothers slaying their daughters out of compassion, and smothering them in the hour of their birth. They consider this barbarous pity as a virtue.

Father Joseph Gumilla, reproving one of them for this inhuman crime, received the following answer:--"I wish to God, Father, I wish to God, that my mother had, by my death, prevented the manifold distresses I have endured, and have yet to endure as long as I live. Had she kindly stilled me in my birth, I should not have felt the pain of death, nor the numberless other pains to which life has subjected me. Consider, Father, our deplorable condition. Our husbands go to hunt with their bows and arrows, and trouble themselves no farther: we are dragged along with one infant at our breast, and another in a basket. They return in the evening without any burden; we return with the burden of our children. Though tired with long walking, we are not allowed to sleep, but must labor the whole night, in grinding maize to make _chica_ for them. They get drunk, and in their drunkenness beat us, draw us by the hair of the head, and tread us under foot. A young wife is brought upon us and permitted to abuse us and our children. What

kindness can we show to our female children, equal to that of relieving them from such servitude, more bitter a thousand times than death? I repeat again, would to God my mother had put me under ground, the moment I was born."

"The men," says Commodore Byron, in his account of the inhabitants of South America, "exercise a most despotic authority over their wives whom they consider in the same view they do any other part of their property, and dispose of them accordingly. Even their common treatment of them is cruel. For, though the toil and hazard of procuring food lies entirely on the women, yet they are not suffered to touch any part of it, until the husband is satisfied; and then he assign them their portion, which is generally very scanty, and such as he has not a stomach for himself."

The Greenlanders, who live mostly upon seals, think it sufficient to catch and bring them on shore; and would rather submit to starve than assist their women in skinning, dressing, or dragging home the cumbrous animals to their huts.

In some parts of America, when the men kill any game in the woods, they lay it at the root of a tree, fix a mark there, and travelling until they arrive at their habitation, send their women to fetch it, a task which their own laziness and pride equally forbid.

Among many of the tribes of wandering Arabs, the women are not only obliged to do every domestic and every rural work, but also to feed, to dress, and saddle the horses, for the use of their husbands.

The Moorish women, besides doing all the same kinds of drudgery, are also obliged to cultivate the fields, while their husbands stand idle spectators of the toil, or sleep inglorious beneath a neighboring shade.

In Madura the husband generally speaks to his wife in the most imperious tone; while she with fear and trembling approaches him, waits upon him while at meals, and pronounces not his name, but with the addition of every dignifying title she can devise. In return for all this submission he frequently beats and abuses her in the most barbarous manner. Being asked the reason of such a behavior, one of them answered, "As our wives are so much our inferiors why should we allow them to eat and drink with us? Why should they not serve us with whatever we call for, and afterwards sit down and eat up what we leave? If they commit faults, why should they not suffer correction? It is their business only to bring up our children, pound our rice, make our oil, and do every other kind of drudgery, purposes to which only their low and inferior natures are adapted."

The Circassian custom of breeding young girls, on purpose to be sold in the public market to the highest bidder, is generally known. Perhaps, however, upon minute examination, we shall find that women are, in some degree, bought and sold in every country, whether savage or civilized.

EASTERN WOMEN.

The women of the East, have in general, always exhibited the same appearance. Their manners, customs, and fashions, unalterable like their rocks, have stood the test of many revolving ages. Though the kingdoms of their country have often changed masters, though they have submitted to the arms of almost every invader, yet the laws by which their sex are governed and enslaved, have never been revised nor amended.

Had the manners and customs of the Asiatic women been subject to the same changes as they are in Europe, we might have expected the same changes in the sentiments and writings of their men. But, as this is not the case, we have reason to presume that the sentiments entertained by Solomon, by the apocryphal writers, and by the ancient Bramins, are the sentiments of this day.

Though the confinement of women be an unlawful exertion of superior power, yet it affords a proof that the inhabitants of the East are advanced some degrees farther in civilization than mere savages, who have hardly any love and consequently as little jealousy.

This confinement is not very rigid in the empire of the Mogul. It is, perhaps, less so in China, and in Japan hardly exists.

Though women are confined in the Turkish empire, they experience every other indulgence. They are allowed, at stated times, to go to the public baths; their apartments are richly, if not elegantly furnished; they have a train of female slaves to serve and amuse them; and their persons are adorned with every costly ornament which their fathers or husbands can afford.

Notwithstanding the strictness of confinement in Persia, their women are treated with several indulgences. They are allowed a variety of precious liquors, costly perfumes, and beautiful slaves: their apartments are furnished with the most elegant hangings and carpets; their persons ornamented with the finest silks, and even loaded with the sparkling jewels of the East. But all these trappings, however elegant, or however gilded, are only like the golden chains sometimes made use of to bind a royal prisoner.

Solomon had a great number of queens and concubines; but a petty Hindoo chief has been known to have two thousand women confined within the walls of his harem, and appropriated entirely to his pleasure. Nothing less than unlimited power in the husband is able to restrain women so confined, from the utmost disorder and confusion. They may repine in secret, but they must clothe their features with cheerfulness when their lord appears. Contumacy draws down on them immediate punishment: they are degraded, chastised, divorced, shut up in dark dungeons, and sometimes put to death.

Their persons, however, are so sacred, that they must not in the least be violated, nor even be looked at, by any one but their husbands. This female privilege has given an opportunity of executing many conspiracies. Warriors, in such vehicles as are usually employed to carry women, have been often conveyed, without examination, into the apartments of the great; from whence, instead of issuing forth in the smiles of beauty, they have rushed out in the terror of arms, and laid the tyrants at their feet.

No stranger is ever allowed to see the women of Hindostan, nor can even brothers visit their sisters in private. To be conscious of the existence of a man's wives seems a crime; and he looks surly and offended if their health is inquired after. In every country, honor consists in something upon which the possessor sets the highest value. This, with the Hindoo, is the chastity of his wives; a point without which he must not live.

In the midst of slaughter and devastation, throughout all the East, the harem is a sanctuary. Ruffians, covered with the blood of a husband, shrink back with veneration from the secret apartment of his wives.

At Constantinople, when the sultan sends an order to strangle a state-criminal, and seize on his effects, the officers who execute it enter not into the harem, nor touch any thing belonging to the women.

Every Turkish seraglio and harem, has a garden adjoining to it, and in the middle of this garden a large room, more or less decorated according to the wealth of the proprietor. Here the ladies spend most of their time, with their attendant nymphs around them employed at their music, embroidery, or loom.

It has long been a custom among the grandees of Asia, to entertain story-tellers of both sexes, who like the _bards_ of ancient Europe, divert them with tales, and little histories, mostly on the subject of bravery and love. These often amuse the women, and beguile the cheerless hours of the harem, by calling up images to their minds which their eyes are forever debarred from seeing.

All their other amusements, as well as this, are indolently voluptuous. They spend a great part of their time in lolling on skien sofas; while a train of female slaves, scarcely less voluptuous, attend to sing to them, to fan them, and to rub their bodies; an exercise which the Easterns enjoy, with a sort of placid ecstasy, as it promotes the circulation of their languid blood.

They bathe themselves in rose water and other baths, prepared with the precious odors of the East. They perfume themselves with costly essences, and adorn their persons, that they may please the _tyrant_ with whom they are obliged to live.

CHINESE WOMAN.

Of all the other Asiatics, the Chinese have, perhaps the best title to modesty. Even the men wrap themselves closely up in their garments, and reckon it indecent to discover any more of their arms and legs than is necessary.--The women, still more closely wrapt up, never discover a naked hand even to their nearest relations, if they can possibly avoid it. Every part of their dress, every part of their behavior is calculated to preserve decency, and inspire respect. And, what adds lustre to of their charms, is that uncommon modesty which appears in every look and in every action.

Charmed, no doubt, with so engaging a deportment, the men behave to them in a reciprocal manner. And, that their virtue may not be contaminated by the neighborhood of vice, the legislature takes care that no prostitutes shall lodge within the walls of any of the great cities of China.

Some, however, suspect whether this appearance of modesty be any thing else than the custom of the country; and allege that, notwithstanding so much decency and decorum, they have their peculiar modes of intriguing, and embrace every possible opportunity of putting them in practice; and that, in these intrigues, they frequently scruple not to stab the paramour they had invited to their arms, as the surest method of preventing detection and loss of character.

A bridegroom knows nothing of the character or person of his intended wife, except what he gathers from the report of some female relative, or confidant, who undertakes to arrange the marriage, and determine the sum that shall be paid for the bride. Very severe laws are made to prevent deception and fraud in these transactions. On the day appointed for the wedding the damsel is placed in

a close palanquin the key of which is sent to the bridegroom, by the hands of some trusty domestic. Her relations and friends accompanied by squalling music, escort her to his house; at the gate of which he stands in full dress, ready to receive her. He eagerly opens the palanquin and examines his bargain. If he is pleased, she enters his dwelling, and the marriage is celebrated with feasting and rejoicing; the men and women being all the time in separate apartments. If the bridegroom is dissatisfied, he shuts the palanquin, and sends the woman back to her relations; but when this happens, he must pay another sum of money equal to the price he first gave for her. A woman who unites beauty with accomplishments brings from four to seven hundred louis d'ors; some sell for less than one hundred. The apartments of the women are separated from those of the men by a wall at which a guard is stationed. The wife is never allowed to eat with her husband; she cannot quit her apartments without permission; and he does not enter hers without first asking leave. Brothers are entirely separated from their sisters at the age of nine or ten years.

AFRICAN WOMEN.

The Africans were formerly renowned for their industry in cultivating the ground, for their trade, navigation, caravans and useful arts.--At present they are remarkable for their idleness, ignorance, superstition, treachery, and, above all, for their lawless methods of robbing and murdering all the other inhabitants of the globe.

Though they still retain some sense of their infamous character, yet they do not choose to reform. Their priests, therefore, endeavor to justify them, by the following story: "Noah," say they, "was no sooner dead, than his three sons, the first of whom was _white_, the second _tawny_, and the third _black_, having agreed upon dividing among them his goods and possessions, spent the greatest part of the day in sorting them; so that they were obliged to adjourn the division till the next morning. Having supped and smoked a friendly pipe together, they all went to rest, each in his own tent. After a few hours sleep, the white brother got up, seized on the gold, silver, precious stones, and other things of the greatest value, loaded the best horses with them, and rode away to that country where his white posterity have been settled ever since. The tawny, awaking soon after, and with the same criminal intention, was surprised when he came to the store house to find that his brother had been beforehand with him. Upon which he hastily secured the rest of the horses and camels, and loading them with the best carpets, clothes, and other remaining goods, directed his route to another part of the world, leaving behind him, only a few of the coarsest goods, and some provisions of little value.

When the third, or black brother, came next morning in the simplicity of his heart to make the proposed division, and could neither find his brethren, nor any of the valuable commodities, he easily judged they had tricked him, and were by that time fled beyond any possibility of discovery.

In this most afflicted situation, he took his _pipe_, and begun to consider the most effectual means of retrieving his loss, and being revenged on his perfidious brothers.

After revolving a variety of schemes in his mind, he at last fixed upon watching every opportunity of making reprisals on them, and laying hold of and carrying away their property, as often as it should fall in his way, in revenge for that patrimony of which they had so unjustly deprived him.

Having come to this resolution, he not only continued in the practice of it all his life, but on his death laid the strongest injunctions on his descendants to do so, to the end of the world."

Some tribes of the Africans, however, when they have engaged themselves in the protection of a stranger, are remarkable for fidelity. Many of them are conspicuous for their temperance, hospitality, and several other virtues.

Their women, upon the whole, are far from being indelicate or unchaste. On the banks of the Niger, they are tolerably industrious, have a considerable share of vivacity, and at the same time a female reserve, which would do no discredit to a politer country. They are modest, affable, and faithful; an air of innocence appears in their looks and in their language, which gives a beauty to their whole deportment.

When, from the Niger, we approach toward the East, the African women degenerate in stature, complexion, sensibility, and chastity. Even their language, like their features, and the soil they inhabit, is harsh and disagreeable. Their pleasures resemble more the transports of fury, than the gentle emotions communicated by agreeable sensations.

GREAT ENTERPRISES OF WOMEN IN THE TIMES OF CHIVALRY.

The times and the manners of chivalry, by bringing great enterprises, bold adventures, and extravagant heroism into fashion, inspired the women with the same taste.

The two sexes always imitate each other. Their manners and their minds are refined or corrupted, invigorated or dissolved together.

The women, in consequence of the prevailing passion, were now seen in the middle of camps and of armies. They quitted the soft and tender inclinations, and the delicate offices of their own sex, for the courage, and the toilsome occupations of ours.

During the crusades, animated by the double enthusiasm of religion and of valor, they often performed the most romantic exploits. They obtained indulgences on the field of battle, and died with arms in their hands, by the side of their lovers, or of their husbands.

In Europe, the women attacked and defended fortifications. Princesses commanded their armies, and obtained victories.

Such was the celebrated Joan de Mountfort, disputing for her duchy of Bretagne, and engaging the enemy herself.

Such was the still more celebrated Margaret of Anjou, queen of England and wife of Henry VI. She was active and intrepid, a general and a soldier. Her genius for a long time supported her feeble husband, taught him to conquer, replaced him upon the throne, twice relieved him from prison, and though oppressed by fortune and by rebels, she did not yield, till she had decided in person twelve battles.

The warlike spirit among the women, consistent with ages of barbarism, when every thing is impetuous because nothing is fixed, and when all excess is the excess of force, continued in Europe upwards of four hundred years, showing itself from time to time, and always in the middle of convulsions, or on the eve of great revolutions.

But there were eras and countries, in which that spirit appeared with particular lustre. Such were the displays it made in the fifteenth and sixteenth centuries in Hungary, and in the Islands of the Archipelago and the Mediterranean, when they were invaded by the Turks.

Every thing conspired to animate the women of those countries with an exalted courage; the prevailing spirit of the foregoing ages; the terror which the name of the Turks inspired; the still more dreadful apprehensions of an unknown enemy; the difference of _dress_, which has a stronger _effect_ than is commonly supposed on the imagination of a people; the difference of religion, which produced a kind of sacred horror; the striking difference of manners; and above all, the confinement of the female sex, which presented to the women of Europe nothing but the frightful ideas of servitude and a master; the groans of honor, the tears of beauty in the embrace of barbarism, and the double tyranny of love and pride!

The contemplation of these objects, accordingly, roused in the hearts of the women a resolute courage to defend themselves; nay, sometimes even a courage of enthusiasm, which hurled itself against the enemy.--That courage, too, was augmented, by the promises of a religion, which offered eternal happiness in exchange for the sufferings of a moment.

It is not therefore surprising, that when three beautiful women of the isle of Cyprus were led prisoners to Selim, to be secluded in the seraglio, one of them, preferring death to such a condition, conceived the project of setting fire to the magazine; and after having communicated her design to the rest, put it in execution.

The year following, a city of Cyprus being besieged by the Turks, the women ran in crowds, mingling themselves with the soldiers, and, fighting gallantly in the breach, were the means of saving their country.

Under Mahomet II. a girl of the isle of Lemnos, armed with the sword and shield of her father, who had fallen in battle, opposed the Turks, when they had forced a gate, and chased them to the shore.

In the two celebrated sieges of Rhodes and Malta, the women, seconding the zeal of the knights, discovered upon all occasions the greatest intrepidity; not only that impetuous and temporary impulse which despises death, but that cool and deliberate fortitude which can support the continued hardships, the toils, and the miseries of war.

OTHER PARTICULARS RESPECTING FEMALES DURING THE AGE OF CHIVALRY.

When a man had said any thing that reflected dishonor on a woman, or accused her of a crime, she was not obliged to fight him to prove her innocence: the combat would have been unequal. But she might choose a champion to fight in her cause, or expose himself to the horrid trial, in order to clear her reputation. Such champions were generally selected from her lovers or friends. But if

she fixed upon any other, so high was the spirit of martial glory, and so eager the thirst of defending the weak and helpless sex, that we meet with no instance of a champion ever having refused to fight for, or undergo whatever custom required, in defence of the lady who had honored him with the appointment.

To the motives already mentioned, we may add another. He who had refused, must inevitably have been branded with the name of coward: and, so despicable was the condition of a coward, in those times of general heroism, that death itself appeared the more preferable choice. Nay, such was the rage of fighting for women, that it became customary for those who could not be honored with the decision of their real quarrels, to create fictitious ones concerning them, in order to create also a necessity of fighting.

Nor was fighting for the ladies confined to single combatants. Crowds of gallants entered the lists against each other. Even kings called out their subjects, to shew their love for their mistresses, by cutting the throats of their neighbors, who had not in the least offended.

In the fourteenth century, when the Countess of Blois and the widow of Mountford were at war against each other, a conference was agreed to, on pretence of settling a peace, but in reality to appoint a combat. Instead of negotiating, they soon challenged each other; and Beaumanoir, who was at the head of the Britons, publicly declared that they fought for no other motive, than to see, by the victory, who had the fairest mistress.

In the fifteenth century, we find an anecdote of this kind still more extraordinary. John, duke de Bourbonnois, published a declaration, that he would go over to England, with sixteen knights, and there fight it out, in order to avoid idleness, and merit the good graces of his mistress.

James IV. of Scotland, having, in all tournaments, professed himself knight to queen Anne of France, she summoned him to prove himself her true and valorous champion, by taking the field in her defence, against his brother-in-law, Henry VIII. of England. He obeyed the romantic mandate; and the two nations bled to feed the vanity of a woman.

Warriors, when ready to engage, invoked the aid of their mistresses, as poets do that of the Muses. If they fought valiantly, it reflected honor on the Dulcineas they adored; but if they turned their backs on their enemies, the poor ladies were dishonored forever.

Love, was at that time, the most prevailing motive to fighting. The famous Gaston de Foix, who commanded the French troops at the battle of Ravenna, took advantage of this foible of his army. He rode from rank to rank, calling his officers by name, and even some of his private men, recommending to them their country, their honor, and, above all, to shew what they could do for their mistresses.

The women of those ages, the reader may imagine, were certainly more completely happy than in any other period of the world. This, however, was not in reality the case.

Custom, which governs all things with the most absolute sway, had, through a long succession of years, given her sanction to such combats as were undertaken, either to defend the innocence, or display the beauty of women. Custom, therefore, either obliged a man to fight for a woman who desired him, or marked the refusal with infamy and disgrace. But custom did not oblige him, in every other part of his conduct, to behave to this woman, or to the sex in general, with that respect and politeness which have happily distinguished the character of more modern times.

The same man who would have encountered giants, or gigantic difficulties, "when a lady was in the case," had but little idea of adding to her happiness, by supplying her with the comforts and elegancies of life. And, had she asked him to stoop, and ease her of a part of that domestic slavery which, almost in every country, falls to the lot of women, he would have thought himself quite affronted.

But besides, men had nothing else, in those ages, than that kind of romantic gallantry to recommend them. Ignorant of letters, arts, and sciences, and every thing that refines human nature, they were, in every thing where gallantry was not concerned, rough and unpolished in their manners and behavior. Their time was spent in drinking, war, gallantry, and idleness. In their hours of relaxation, they were but little in company with their women; and when they were, the indelicacies of the carousal, or the cruelties of the field, were almost the only subjects they had to talk of.

From the subversion of the Roman empire, to the fourteenth or fifteenth century, women spent most of their time alone. They were almost entire strangers to the joys of social life. They seldom went abroad, but to be spectators of such public diversions and

amusements as the fashion of the times countenanced. Francis I. was the first monarch who introduced them on public days to court.

Before his time, nothing was to be seen at any of the courts of Europe, but long bearded politicians, plotting the destruction of the rights and liberties of mankind; and warriors clad in complete armor, ready to put their plots in execution.

In the eighth century, so slavish was the condition of women on the one hand, and so much was beauty coveted on the other, that, for about two hundred years, the kings of Austria were obliged to pay a tribute to the Moors, of one hundred beautiful virgins per annum.

In the thirteenth and fourteenth centuries, elegance had scarcely any existence, and even cleanliness was hardly considered as laudable. The use of linen was not known; and the most delicate of the fair sex wore woollen shifts.

In the time of Henry VIII. the peers of the realm carried their wives behind them on horseback when they went to London; and, in the same manner, took them back to their country seats, with hoods of waxed linen over their heads, and wrapped in mantles of cloth, to secure them from the cold.

There was one misfortune of a singular nature, to which women were liable in those days: they were in perpetual danger of being accused of witchcraft, and suffering all the cruelties and indignities of a mob, instigated by superstition and directed by enthusiasm; or of being condemned by laws, which were at once a disgrace to humanity and to sense. Even the bloom of youth and beauty could not secure them from torture and from death. But when age and wrinkles attacked a woman, if any thing uncommon happened in her neighborhood, she was almost sure of atoning with her life for a crime it was impossible for her to commit.

FRENCH WOMEN.

Though the ladies of France are not very handsome, they are sensible and witty. To many of them, without the least flattery, may be applied the distich which Sappho ascribes to herself:

"_If partial nature has denied me beauty, the charms of my mind amply make up for the deficiency._"

No women upon earth can excel, and few rival them, in their almost native arts of pleasing all who approach them. Add to this, an education beyond that of most European ladies, a consummate skill in those accomplishments that suit the fair sex, and the most graceful manner of displaying that knowledge to the utmost advantage.

Such is the description that may safely be given of the French ladies in general. But the spirit, or rather the _evil genius_ of gallantry, too often perverts all these lovely qualities, and renders them subservient to very iniquitous ends.

In every country, women have always a little to do, and a great deal to say. In France, they dictate almost every thing that is said, and direct every thing that is done. They are the most restless beings in the world. To fold her hands in idleness, and impose silence on her tongue, would be to a French woman worse than death. The sole joy of her life is to be engaged in the prosecution of some scheme, relating either to fashion, ambition, or love.

Among the rich and opulent, they are entirely the votaries of pleasure, which they pursue through all its labyrinths, at the expense of fortune, reputation, and health. Giddy and extravagant to the last degree, they leave to their husbands economy and care, which would only spoil their complexions, and furrow their brows.

When we descend to tradesmen and mechanics, the case is reversed: the wife manages every thing in the house and shop, while the husband lounges in the back-shop an idle spectator, or struts about with his sword and bag-wig.

Matrimony among the French, seems to be a bargain entered into by a male and female, to bear the same name, live in the same house, and pursue their separate pleasures without restraint or control. And, so religiously is this part of the bargain kept, that both parties shape their course exactly as convenience and inclination dictate.

The French girls are kept under very strict superintendence. They are not allowed to go to parties, or places of public amusement, without being accompanied by some married female relation; and they see their lovers only in the presence of a third person. Marriages are entirely negotiated by parents; and sometimes the wedding day is the second time that a bride and bridegroom see each other. Nothing is more common than to visit a lady, and attend her parties, without knowing her husband by sight; or to visit a gentleman without ever being introduced to his wife. If a married couple were to be seen frequently in each other's company, they

would be deemed extremely ungenteel. After ladies are married, they have unbounded freedom. It is a common practice to receive morning calls from gentlemen, before they have risen from bed; and they talk with as little reserve to such visiters, as they would in the presence of any woman of refinement.

In no country does real politeness shew itself more than in France, where the company of the women is accessible to every man who can recommend himself by his dress, and by his address. To affectation and prudery the French women are equally strangers. Easy and unaffected in their manners, their politeness has so much the appearance of nature, that one would almost believe no part of it to be the effect of art. An air of sprightliness and gaiety sits perpetually on their countenances, and their whole deportment seems to indicate that their only business is to "strew the path of life with flowers." Persuasion hangs on their lips; and, though their volubility of tongue is indefatigable, so soft is their accent, so lively their expression, so various their attitudes, that they fix the attention for hours together on a tale of nothing.

The Jewish doctors have a fable concerning the etymology of the word Eve, which one would almost be tempted to say is realized in the French women. "Eve," say they, "comes from a word, which signifies to talk; and she was so called, because, soon after the creation, there fell from heaven twelve baskets full of chit chat, and she picked up _nine_ of them, while her husband was gathering the other _three_."

French ladies, especially those not young, use a great deal of rouge. A traveller who saw many of them in their opera boxes, says, "I could compare them to nothing but a large bed of pionies."

After the French revolution, it became the fashion to have everything in ancient classic style. Loose flowing drapery, naked arms, sandaled feet, and tresses twisted, were the order of the day.

The state of gross immorality that prevailed at this time ought not to be described, if language had the power. The profligacy of Rome in its worst days was comparatively thrown into the shade. Religion and marriage became a mockery, and every form of impure and vindictive passion walked abroad, with the consciousness that public opinion did not require them to assume even a slight disguise. The fish-women of Paris will long retain an unenviable celebrity for the brutal excess of their rage. The goddess of Reason was worshipped by men, under the form of a living woman entirely devoid of clothing; and in the public streets ladies might be seen who scarcely paid more attention to decorum.

ITALIAN WOMEN.

Dr Goldsmith thus characterises the Italians in general:

"Could nature's bounty satisfy the breast, The sons of Italy were surely blest. Whatever fruits in different climes are found, That proudly rise, or humbly court the ground; Whatever blooms in torrid tracts appear, Whose bright succession decks the varied year: Whatever sweets salute the northern sky, With vernal leaves that blossom but to die: These here disporting, own the kindred soil, Nor ask luxuriance from their planter's toil; While sea-born gales their gelid wings expand, To winnow fragrance round the smiling land.

"But small the bliss that sense alone bestows, And sensual bliss is all the nation knows. In florid beauty groves and fields appear, Man seems the only growth that dwindles here. Contrasted faults thro' all his manners rein; Though poor, luxurious; though submissive, vain; Though grave, yet trifling; zealous, yet untrue; And e'en in penance planning sins anew. All evils here contaminate the mind, That opulence departed leaves behind: For wealth was theirs, not far remov'd the date, When commerce proudly flourish'd thro' the state; At her command the palace learn'd to rise, Again the long fall'n column sought the skies; The canvass glow'd, beyond e'en nature warm; The pregnant quarry teem'd with human form. Till, more unsteady then the southern gale, Commerce on other shores display'd her sail; While naught remain'd of all that riches gave, But towns unmann'd, and lords without a slave; And late the nation found, with fruitless skill, Its former strength was but plethoric ill.

"Yet still the loss of wealth is here supplied By arts, the splendid wrecks of former pride; From them the feeble heart and long fall'n mind An easy compensation seem to find. Here may be seen in bloodless pomp array'd, The pasteboard triumph, and the cavalcade; Processions form'd from piety and love, A mistress or a saint in every grove."

Almost every traveller who has visited Italy, agrees in describing it as the most abandoned of all the countries of Europe. At Venice, at Naples, and indeed in almost every port of Italy, women are taught from their infancy the various arts of alluring to their arms the young and unwary, and of obtaining from them, while heated by love or wine, every thing that flattery and false smiles can obtain, in

these unguarded moments.

The Italians, like their neighbors of Spain and Portugal, live under the paralyzing influence of a religion that retains its superstitious forms, while little of life-giving faith remains. Like them they have lively passions, are extremely susceptible, and in the general conduct of life more governed by the impetuosity of impulse than rectitude of principle. The ladies have less gravity than the Spanish, and less frivolity than the French, and in their style of dress incline towards the freedom of the latter. Some of the richest and most commodious convents of Europe are in Italy. The daughters of wealthy families are generally bestowed in marriage as soon as they leave these places of education. These matters are entirely arranged by parents and guardians, and youth and age are not unfrequently joined together, for the sake of uniting certain acres of land. But the affections, thus repressed, seek their natural level by indirect courses. It is a rare thing for an Italian lady to be without her _cavaliere servente_, or lover, who spends much of his time at her house, attends her to all public places, and appears to live upon her smiles. The old maxim of the Provencal troubadours, that matrimony ought to be no hindrance to such _liaisons_, seems to be generally and practically believed in Italy.

In Genoa, there are marriage-brokers, who have pocketbooks filled with the names of marriageable girls of different classes, with an account of their fortunes, personal attractions, &c. When they succeed in arranging connections, they have two or three per cent. commission on the portion. The marriage-contract is often drawn up before the parties have seen each other. If a man dislikes the appearances or manners of his future partner, he may break off the match, on condition of paying the brokerage and other expenses.

SPANISH WOMEN.

As the Spanish ladies are under a greater seclusion from general society, than the sex is in other European countries, their desires of an adequate degree of liberty are consequently more strong and urgent. A free and open communication being denied them, they make it their business to secure themselves a secret and hidden one. Hence it is that Spain is the country of intrigue.

The Spanish women are little or nothing indebted to education. But nature has liberally supplied them with a fund of wit and sprightliness, which is certainly no small inducement to those, who have only transient glimpses of their charms, to wish very earnestly for a removal of those impediments, that obstruct their more frequent presence. This not being attainable in a lawful way of customary intercourse, the natural propensity of men to overcome difficulties of this kind, incites them to leave no expedient untried to gain admittance to what perhaps was at first only the object of their admiration, but which, by their being refused an innocent gratification of that passion, becomes at last the subject of a more serious one. Thus in Spain, as in all countries where the sex is kept much out of sight, the thoughts of men are continually employed in devising methods to break into their concealments.

There is in the Spaniards a native dignity; which, though the source of many inconveniences, has nevertheless this salutary effect, that it sets them above almost every species of meanness and infidelity. This quality is not peculiar to the men; it diffuses itself, in a great measure, among the women also. Its effects are visible both in their constancy in love and friendship, in which respects they are the very reverse of the French women. Their affections are not to be gained by a bit of sparkling lace, or a tawdry set of liveries. Their deportment is rather grave and reserved; and, on the whole, they have much more of the prude than the coquette in their composition. Being more confined at home, and less engaged in business and pleasure, they take more care of their children than the French, and have a becoming tenderness in their disposition to all animals, except a _heretic_ and a _rival_.

Something more than a century ago, the Marquis D'Astrogas having prevailed on a young woman of great beauty to become his mistress, the Marchioness hearing of it, went to her lodging with some assassins, killed her, tore out her heart, carried it home, made a _ragout_ of it, and presented the dish to the Marquis. "It it exceedingly good," said he. "No wonder," answered she, "since it was made of the _heart_ of that creature you so much doated on." And, to confirm what she had said, she immediately drew out her head all bloody from beneath her hoop, and rolled it on the floor, her eyes sparkling all the time with a mixture of pleasure and infernal fury.

A lady to whom a gentleman pays his addresses, is sole mistress of his time and money; and, should he refuse her any request, whether reasonable or capricious, it would reflect eternal dishonor upon him among the men, and make him the detestation of all the women.

But, in no situation does their character appear so whimsical, or their power so conspicuous, as when they are pregnant. In this case, whatever they long for, whatever they ask, or whatever they have an inclination to do, they must be indulged in.

ENGLISH WOMEN.

The women of England are eminent for many good qualities both of the head and of the heart. There we meet with that inexpressible softness and delicacy of manners, which, cultivated by education, appears as much superior to what it does without it, as the polished diamond appears superior to that which is rough from the mine. In some parts of the world, women have attained to so little knowledge and so little consequence, that we consider their virtues as merely of the negative kind. In England they consist not only in abstinence from evil, but in doing good.

There we see the sex every day exerting themselves in acts of benevolence and charity, in relieving the distresses of the body, and binding up the wounds of the mind; in reconciling the differences of friends, and preventing the strife of enemies; and, to sum up all, in that care and attention to their offspring, which is so necessary and essential a part of their duty.

A woman may succeed to the throne of England with the same power and privileges as a king; and the business of the state is transacted in her name, while her husband is only a subject. The king's wife is considered as a subject; but is exempted from the law which forbids any married woman to possess property in her own right during the lifetime of her husband; she may sue any person at law without joining her husband in the suit; may buy and sell lands without his interference; and she may dispose of her property by will, as if she were a single woman. She cannot be fined by any court of law; but is liable to be tried and punished for crimes by peers of the realm. The queen dowager enjoys nearly the same privileges that she did before she became a widow; and if she marries a subject still continues to retain her rank and title; but such marriages cannot take place without permission from the reigning sovereign. A woman who is noble in her own right, retains her title when she marries a man of inferior rank; but if ennobled by her husband, she loses the title by marrying a commoner. A peeress can only be tried by a jury of peers.

In old times, a woman who was convicted of being a common mischief-maker and scold, was sentenced to the punishment of the ducking-stool; which consisted of a sort of chair fastened to a pole, in which she was seated and repeatedly let down into the water, amid the shouts of the rabble. At Newcastle-upon-Tyne, a woman convicted of the same offence was led about the streets by the hangman, with an instrument of iron bars fitted on her head, like a helmet. A piece of sharp iron entered the mouth, and severely pricked the tongue whenever the culprit attempted to move it.

A great deal of vice prevails in England, among the very fashionable, and the very low classes. Misconduct and divorces are not unfrequent among the former, because their mode of life corrupts their principles, and they deem themselves above the jurisdiction of popular opinion; the latter feel as if they were beneath the influence of public censure, and find it very difficult to be virtuous, on account of extreme poverty, and the consequent obstructions in the way of marriage. But the general character of English women is modest, reserved, sincere, and dignified. They have strong passions and affections, which often develope themselves in the most beautiful forms of domestic life. They are in general remarkable for a healthy appearance, and an exquisite bloom of complexion. Perhaps the world does not present a lovelier or more graceful picture than the English home of a virtuous family.

RUSSIAN WOMEN.

It is only a few years since the Russians emerged from a state of barbarity.

A late empress of Russia, as a punishment for some female frailties, ordered a most beautiful young lady of family to be publicly chastised, in a manner which was hardly less indelicate than severe.

It is said that the Russian ladies were formerly as submissive to their husbands in their families, as the latter are to their superiors in the field; and that they thought themselves ill treated, if they were not often reminded of their duty by the discipline of a _whip_, manufactured by themselves, which they presented to their husbands on the day of their marriage. The latest travellers, however, assert, that they find no remaining traces of this custom at present.

Russian fathers, of all classes, generally arrange marriages for their children, without consulting their inclinations. Among the peasantry, if the girl has the name of being a good housewife, her parents will not fail to have applications for her, whatever may be her age or personal endowments. As soon as a young man is old enough to be married, his parents seek a wife for him, and all is settled before the young couple know any thing of the matter.

Their nuptial ceremonies are peculiar to themselves; and formerly consisted of many whimsical rites, some of which are now disused. On her wedding day, the bride is crowned with a garland of wormwood; and, after the priest has tied the nuptial knot, his clerk or sexton throws a handful of hops upon the head of the bride, wishing that she might prove as fruitful as that plant. She is

then led home, with abundance of coarse ceremonies, which are now wearing off even among the lowest ranks; and the barbarous treatment of wives by their husbands is either guarded against by the laws of the country, or by particular stipulations in the marriage contract.

In the conversation and actions of the Russian ladies, there is hardly any thing of that softness and delicacy which distinguishes the sex in other parts of Europe. Even their exercises and diversions have more of the masculine than the feminine. The present empress, with the ladies of her court, sometimes divert themselves by shooting at a mark. Drunkenness, the vice of almost every cold climate, they are so little ashamed of, that not many years ago, when a lady got drunk at the house of a friend, it was customary for her to return next day, and thank him for the pleasure he had done her.

Females, however, in Russia, possess several advantages. They share the rank and splendor of the families from which they are sprung, and are even allowed the supreme authority. This a few years ago, was enjoyed by an empress, whose head did honor to her nation and to her sex; although, on some occasions, the virtues of her heart have been much suspected. The sex, in general, are protected from insult, by many salutary laws; and, except among the peasants, are exempted from every kind of toil and slavery. Upon the whole, they seem to be approaching fast to the enjoyment of that consequence, to which they have already arrived in several parts of Europe.

THE IDEA OF FEMALE INFERIORITY.

It is an opinion pretty well established, that in strength of mind, as well as of body, men are greatly superior to women.

Men are endowed with boldness and courage, women are not. The reason is plain, these are beauties in our character; in theirs they would be blemishes. Our genius often leads to the great and the arduous; theirs to the soft and the pleasing; we bend our thoughts to make life convenient; they turn theirs to make it easy and agreeable. If the endowments allotted to us by nature could not be easily acquired by women, it would be as difficult for us to acquire those peculiarly allotted to them. Are we superior to them in what belongs to the male character? They are no less so to us, in what belongs to the female character.

Would it not appear rather ludicrous to say, that a man was endowed only with inferior abilities, because he was not expert in the nursing of children, and practising the various effeminacies which we reckon lovely in a woman? Would it be reasonable to condemn him on these accounts? Just as reasonable, as it is to reckon women inferior to men, because their talents are in general not adapted to tread the horrid path of war, nor trace the mazes and intricacies of science.

The idea of the inferiority of female nature has drawn after it several others the most absurd, unreasonable, and humiliating to the sex. Such is the pride of man, that in some countries he has considered immortality as a distinction too glorious for women. Thus degrading the fair partners of his nature, he places them on a level with the beasts that perish.

As the Asiatics have, time immemorial, considered women as little better than slaves, this opinion probably originated among them. The Mahometans, both in Asia and Europe, are said, by a great variety of writers, to entertain this opinion.

Lady Montague, in her letters, has opposed this general assertion of the writers concerning the Mahometans; and says that they do not absolutely deny the existence of female souls, but only hold them to be of a nature inferior to those of men; and that they enter not into the same, but into an inferior paradise, prepared for them on purpose. Lady Montague, and the writers whom she has contradicted, may perhaps be both right. The former might be the opinion which the Turks brought with them from Asia; and the latter, as a refinement upon it they may have adopted by their intercourse with the Europeans.

This opinion, however, has had but few votaries in Europe: though some have even here maintained it, and assigned various reasons for so doing. Among these, the following laughable reason is not the least particular--"In the Revelations of St. John the divine," said one, whose wife was a descendant of the famous Xantippe,[1] "you will find this passage: _And there was silence in heaven for about the space of half an hour_. Now, I appeal to any one, whether that could possibly have happened, had there been any women there? And, since there are none there, charity forbids us to imagine that they are all in a worse place; therefore it follows that they have no immortal part: and happy is it for them, as they are thereby exempted from being accountable for all the noise and disturbance they have raised in this world."

In a very ancient treatise, called the Wisdom of all Times, ascribed to Hushang, one of the earliest kings of Persia, are the following remarkable words: "The passions of men may, by long acquaintance, be thoroughly known; but the passions of women are inscrutable; therefore they ought to be separated from men, lest the mutability of their tempers should infect others."

Ideas of a similar nature seem to have been at this time, generally diffused over the East. For we find Solomon, almost every where in his writings, exclaiming against women; and, in the Apocrypha, the author of Ecclesiasticus is still more illiberal in his reflections.

Both these authors, it is true, join in the most enraptured manner to praise a virtuous woman; but take care at the same time to let us know, that she is so great a rarity as to be very seldom met with.

Nor have the Asiatics alone been addicted to this illiberality of thinking concerning the sex. Satirists of all ages and countries, while they flattered them to their faces, have from their closets scattered their spleen and ill-nature against them. Of this the Greek and Roman poets afford a variety of instances; but they must nevertheless yield the palm to some of our moderns. In the following lines, Pope has outdone every one of them:

"Men some to pleasure, some to business take; But every woman is at heart--a rake."

Swift and Dr Young have hardly been behind this celebrated splenetic in illiberality. They perhaps were not favorites of the fair, and in revenge vented all their envy and spleen against them. But a more modern and accomplished writer who by his rank in life, by his natural and acquired _graces_, was undoubtedly a favorite, has repaid their kindness by taking every opportunity of exhibiting them in the most contemptible light. "Almost every man," says he, "may be gained some way, almost every woman any way, can any thing exhibit a stronger caution to the sex?" It is fraught with information; and it is to be hoped they will use it accordingly.

[1] Xantippe, was the wife of Socrates, and the most famous scold of antiquity.

FEMALE SIMPLICITY.

Would we conceive properly of that simplicity which is the sweetest expression of a well-informed and well-meaning mind, which every where diffuses tenderness and delicacy, sweetens the relations of life, and gives a zest to the minutest duties of humanity, let us contemplate every perceptible operation of nature, the twilight of the evening, the pearly dew-drops of the early morning, and all that various growth which indicates the genial return of spring. The same principle from which all that is soft and pleasing, amiable or exquisite, to the eye or to the ear, in the exterior frame of nature, produces that taste for true simplicity, which is one of the most useful, as well as the most elegant lessons, that _ladies_ can learn.

Infancy, is perhaps, the finest and most perfect illustration of simplicity. It is a state of genuine nature throughout. The feelings of children are under no kind of restraint, but pure as the fire, free as the winds, honest and open as the face of heaven. Their joys incessantly flow in the thickest succession, and their griefs only seem fleeting and evanescent. To the calls of nature they are only attentive. They know no voice but hers. Their obedience to all her commands is prompt and implicit. They never anticipate her bounties, nor relinquish her pleasures. This situation renders them independent of artifice. Influenced only by nature, their manners, like the principle that produces them, are always the same.

Genuine simplicity is that peculiar quality of the mind, by which some happy characters are enabled to avoid the most distant approaches to any thing like affectation, inconstancy, or design, in their intercourse with the world. It is much more easily understood, however than defined; and consists not in a specific tone of the voice, movement of the body, or mode imposed by custom, but is the natural and permanent effect of real modesty and good sense on the whole behavior.

This has been considered in all ages, as one of the first and most captivating ornaments of the sex. The savage, the plebeian, the man of the world, and the courtier, are agreed in stamping it with a preference to every other female excellence.

Nature only is lovely, and nothing unnatural can ever be amiable. The genuine expressions of truth and nature are happily calculated to impress the heart with pleasure. No woman, whatever her other qualities may be, was ever eminently agreeable, but in proportion as distinguished by these. The world is good-natured enough to give a lady credit for all the merit she can possess or acquire, without affectation. But the least shade or coloring of this odious foible brings certain and indelible obloquy on the most elegant accomplishments. The blackest suspicion inevitably rests on every thing assumed. She who is only an ape of others, or prefers formality in all its gigantic and preposterous shapes, to that plain, unembarassed conduct which nature unavoidably produces, will assuredly provoke an abundance of ridicule, but never can be an object either of love or esteem.

The various artifices of the sex discover themselves at a very early period. A passion for expense and show is one of the first they exhibit. This gives them a taste for refinement, which divests their young hearts of almost every other feeling, renders their tempers desultory and capricious, regulates their dress only by the most fantastic models of finery and fashion, and makes their company rather tiresome and awkward, than pleasing or elegant.

No one perhaps can form a more ludicrous contrast to every thing just and graceful in nature, than the woman whose sole object in life is to pass for a _fine lady_. The attentions she every where and uniformly pays, expects, and even exacts, are tedious and fatiguing. Her various movements and attitudes are all adjusted and exhibited by rule. By a happy fluency of the most eloquent language, she has the art of imparting a momentary dignity and grace to the merest trifles. Studious only to mimic such peculiarities as are most admired in others, she affects a loquacity peculiarly flippant and teazing because scandal, routs, finery, fans, china, lovers, lap-dogs, or squirrels, are her constant themes. Her amusements, like those of a magpie, are only hopping over the same spots, prying into the same corners, and devouring the same species of prey. The simple and beautiful delineations of nature, in her countenance, gestures and whole deportment, are habitually arranged, distorted, or concealed, by the affected adoption of whatever grimace or deformity is latest or most in vogue.

She accustoms her face to a simper, which every separate feature in it belies. She spoils, perhaps, a blooming complexion with a profusion of artificial coloring, she distorts the most exquisite shape by loads or volumes of useless drapery. She has her head, her arms, her feet, and her gait, equally touched by art and affectation, into what is called the _taste_, the _ton_, or the _fashion_.

She little considers to what a torrent of ridicule and sarcasm this mode of conduct exposes her; or how exceedingly cold and hollow that ceremony must be, which is not the language of a warm heart. She does not reflect how insipid those smiles are, which indicate no internal pleasantry; nor how awkward those graces, which spring not from habits of good-nature and benevolence. Thus, pertness succeeds to delicacy, assurance to modesty, and all the vagaries of a listless to the sensibilities of an ingenuous mind.

With her, punctilio is politeness; dissipation, life; and levity, spirit. The miserable and contemptible drudge of every tawdry innovation in dress or ceremony, she incessantly mistakes extravagance for taste, and finery for elegance.

Her favorite examples are not those persons of acknowledged sincerity, who speak as they feel, and act as they think; but such only as are formed to dazzle her fancy, amuse her senses, or humor her whims. Her only study is how to glitter or shine, how to captivate and gratify the gaze of the multitude, or how to swell her own pomp and importance. To this interesting object all her assiduities and time are religiously devoted.

How often is debility of mind, and even badness of heart concealed under a splendid exterior! The fairest of the species, and of the sex, often want sincerity; and without sincerity every other qualification is rather a blemish, than a virtue, or excellence. Sincerity operates on the moral, somewhat like the sun on the natural world; and produces nearly the same effects on the dispositions of the human heart, which he does on inanimate objects. Wherever sincerity prevails and is felt, all the smiling and benevolent virtues flourish most, disclose their sweetest lustre, and diffuse their richest fragrance.

Heaven has not a finer or more perfect emblem on earth than a woman of genuine simplicity. She affects no graces which are not inspired by sincerity. Her opinions result not from passion and fancy, but from reason and experience. Candor and humility give expansion to her heart. She struggles for no kind of chimerical credit, disclaims the appearance of every affectation, and is in all things just what she seems, and others would be thought. Nature, not art, is the great standard of her manners; and her exterior wears no varnish, or embellishment, which is not the genuine signature of an open, undesigning, and benevolent mind. It is not in her power, because not in her nature, to hide, with a fawning air, and a mellow voice, her aversion or contempt, where her delicacy is hurt, here temper ruffled, or her feelings insulted.

In short, whatever appears most amiable, lovely, or interesting in nature, art, manners, or life, originates in simplicity. What is correctness in taste, purity in morals, truth in science, grace in beauty, but simplicity? It is the garb of innocence. It adorned the first ages, and still adorns the infant state of humanity. Without simplicity, woman is a vixen, a coquette, a hypocrite; society a masquerade, and pleasure a phantom.

The following story, I believe, is pretty generally known. A lady, whose husband had long been afflicted with an acute but lingering disease, suddenly feigned such an uncommon _tenderness_ for him, as to resolve on dying in his stead. She had even the address to persuade him not to outlive this extraordinary instance of her conjugal fidelity and attachment. It was instantaneously agreed they should mutually swallow such a quantity of arsenic, as would speedily effect their dreadful purpose. She composed the fatal draught before his face and even set him the desperate example of drinking first. By this device, which had all the appearance of the greatest affection and candor, the dregs only were reserved for him, and soon put a period to his life.

It then appeared that the dose was so tempered, as, from the weight of the principal ingredient, to be deadly only at the bottom, which she had artfully appropriated for his share. Even after all this finesse, she seized, we are told, his inheritance, and insulted his memory by a second marriage.

THE MILD MAGNANIMITY OF WOMEN.

A late eminent anatomist, in a professional discourse on the female frame, is said to have declared, that it almost appeared an act of cruelty in nature to produce such a being as woman. This remark may, indeed, be the natural exclamation of refined sensibility, in contemplating the various maladies to which a creature of such delicate organs is inevitably exposed; but, if we take a more enlarged survey of human existence, we shall be far from discovering any just reason to arraign the benevolence of its provident and gracious Author. If the delicacy of woman must render her familiar with pain and sickness, let us remember that her charms, her pleasures, and her happiness, arise also from the same attractive quality. She is a being, to use the forcible and elegant expression of a poet,

"Fine by defect, and admirably weak."

There is, perhaps, no charm by which she more effectually secures the tender admiration and the lasting love, of the more hardy sex, than her superior endurance, her mild and _graceful_ submission to the common evils of life.

Nor is this the sole advantage she derives from her gentle fortitude. It is the prerogative of this lovely virtue, to lighten the pressure of all those incorrigible evils which it cheerfully endures. The frame of man may be compared to the sturdy _oak_, which is often shattered by resisting the tempest. Woman is the pliant _osier_, which, in bending to the storm, eludes its violence.

The accurate observers of human nature will readily allow, that patience is most eminently the characteristic of woman. To what a sublime and astonishing height this virtue has been carried by beings of the most delicate texture, we have striking examples in the many female martyrs who were exposed, in the first ages of christianity, to the most barbarous and lingering torture.

Nor was it only from christian zeal that woman derived the power of defying the utmost rigors of persecution with invincible fortitude. Saint Ambrose, in his elaborate and pious treatise on this subject, records the resolution of a fair disciple of Pythagoras, who, being severely urged by a tyrant to reveal the secrets of her sex, to convince him that no torments should reduce her to so unworthy a breach of her vow, bit her own _tongue_ asunder, and darted it in the face of her oppressor.

In consequence of those happy changes which have taken place in the world, from the progress of purified religion, the inexpressible spirit of the tender sex is no longer exposed to such inhuman trials. But if the earth is happily delivered from the demons of torture and superstition; if beauty and innocence are no more in danger of being dragged to perish at the stake--perhaps there are situations, in female life, that require as much patience and magnanimity, as were formerly exerted in the fiery torments of the virgin martyr. It is more difficult to support an accumulation of _minute_ infelicities, than any single calamity of the most terrific magnitude.

FEMALE DELICACY.

Where the human race has little other culture than what it receives from nature, the two sexes live together, unconscious of almost any restraint on their words or on their actions. The Greeks, in the heroic ages, as appears from the whole history of their conduct, were totally unacquainted with delicacy. The Romans in the infancy of their empire, were the same. Tacitus informs us that the ancient Germans had not separate beds for the two sexes, but that they lay promiscuously on reeds or on heath, spread along the walls of their houses. This custom still prevails in Lapland, among the peasants of Norway, Poland, and Russia; and it is not altogether obliterated in some parts of the highlands of Scotland and Wales.

In Otaheite, to appear naked or in clothes, are circumstances equally indifferent to both sexes; nor does any word in their language, nor any action to which they are prompted by nature, seem more indelicate or reprehensible than another. Such are the effects of a total want of culture.

Effects not very dissimilar, are, in France and Italy, produced from a redundance of it. Though those are the polite countries in Europe, women there set themselves above shame, and despise delicacy. It is laughed out of existence, as a silly and unfashionable weakness.

But in China, one of the politest countries in Asia, and perhaps not even, in this respect, behind France, or Italy, the case is quite otherwise. No human being can be more delicate than a Chinese woman in her dress, in her behavior, and in her conversation; and should she ever happen to be exposed in any unbecoming manner, she feels with the greatest poignancy the awkwardness of her situation, and if possible, covers her face, that she may not be known.

In the midst of so many discordant appearances, the mind is perplexed, and can hardly fix upon any cause to which female delicacy is to be ascribed. If we attend, however, to the whole animal creation, if we consider it attentively wherever it falls under our observation, it will discover to us, that in the female there is a greater degree of delicacy or coy reserve than in the male. Is not this a proof, that, through the wide extent of creation, the seeds of delicacy are more liberally bestowed upon females than upon males?

In the remotest periods of which we have any historical account, we find that the women had a delicacy to which the other sex were strangers. Rebecca veiled herself when she first approached Isaac, her future husband. Many of the fables of antiquity mark, with the most distinguishing characters, the force of female delicacy. Of this kind is the fable of Actaeon and Diana. Actaeon, a famous hunter, being in the woods with his hounds, beating for game, accidentally spied Diana and her nymphs bathing in a river. Prompted by curiosity, he stole silently into a neighboring thicket, that he might have a nearer view of them. The goddess discovering him, was so affronted at his audacity, and so much ashamed to have been seen naked, that in revenge she immediately transformed him into a stag, set his own hounds upon him, and encouraged them to overtake and devour him. Besides this, and other fables, and historical anecdotes of antiquity, their poets seldom exhibit a female character without adorning it with the graces of modesty and delicacy. Hence we may infer, that these qualities have not been only essential to virtuous women in civilized countries, but were also constantly praised and esteemed by men of sensibility; and that delicacy is an innate principle in the female mind.

There are so many evils attending the loss of virtue in women, and so greatly are the minds of that sex depraved when they have deviated from the path of rectitude, that a general contamination of their morals may be considered as one of the greatest misfortunes that can befal a state, as in time it destroys almost every public virtue of the men. Hence all wise legislators have strictly enforced upon the sex a particular purity of manners; and not satisfied that they should abstain from vice only, have required them even to shun every appearance of it.

Such, in some periods, were the laws of the Romans; and such were the effects of these laws, that if ever female delicacy shone forth in a conspicuous manner, it was perhaps among those people, after they had worn off much of the barbarity of their first ages, and before they became contaminated, by the wealth and manners of the nations which they plundered and subjected. Then it was that we find many of their women surpassing in modesty almost every thing related by fable; and then it was that their ideas of delicacy were so highly refined, that they could not even bear the secret consciousness of an involuntary crime, and far less of having tacitly consented to it.

INFLUENCE OF FEMALE SOCIETY.

The company of ladies has a very powerful influence on the sentiments and conduct of men. Women, the fruitful source of half our joys, and perhaps of _more_ than half our sorrows, give an elegance to our manner, and a relish to our pleasures. They soothe our afflictions, and soften our cares. Too much of their company will render us effeminate, and infallibly stamp upon us many signatures of the female nature. A rough and unpolished behavior, as well as slovenliness of person, will certainly be the consequence of an almost constant exclusion from it. By spending a reasonable portion of our time in the company of women, and another in the company of our own sex, we shall imbibe a proper share of the softness of the female, and at the same time retain the firmness and constancy of the male.

As little social intercourse subsisted between the two sexes, in the more early ages of antiquity, we find the men less courteous, and the women less engaging. Vivacity and cheerfulness seem hardly to have existed. Even the Babylonians, who appear to have allowed their women more liberty than any of the ancients, seem not to have lived with them in a friendly and familiar manner. But, as their intercourse with them was considerably greater than that of the neighboring nations, they acquired thereby a polish and refinement unknown to any of the people who surrounded them. The manners of both sexes were softer, and better calculated to please.

They likewise paid more attention to cleanliness and dress.

After the Greeks became famous for their knowledge of the arts and sciences, their rudeness and barbarity were only softened a _few degrees_. It is not therefore arts, sciences, and _learning_, but the company of the other sex, that forms the manner and renders the man _agreeable_.

The Romans were, for some time, a community without any thing to soften the ferocity of male nature. The Sabine virgins, whom they had stolen, appear to have infused into them the first ideas of politeness. But it was many ages before this politeness banished the roughness of the warrior, and assumed the refinement of the gentleman.

During the times of chivalry, female influence was at the zenith of its glory and perfection. It was the source of valor, it gave birth to politeness, it awakened pity, it called forth benevolence, it restricted the hand of oppression, and meliorated the human heart. "I cannot approach my mistress," said one, "till I have done some glorious deed to deserve her notice. Actions should be the messengers of the heart; they are the homage due to beauty, and they only should discover love."

Marsan, instructing a young knight how to behave so as to gain the favor of the fair, has these remarkable words:--"When your arm is raised, if your lance fail, draw your sword directly; and let heaven and hell resound with the clash. Lifeless is the soul which beauty cannot animate, and weak is the arm which cannot fight valiantly to defend it."

The Russians, Poles, and even the Dutch, pay less attention to their females than any of their neighbors, and are, by consequence, less distinguished for the graces of their persons, and the feelings of their hearts.

The lightness of their food, and the salubrity of their air, have been assigned as reasons for the vivacity and cheerfulness of the French, and their fortitude, in supporting their spirits through all the adverse circumstances of this world. But the constant mixture of the young and old, of the two sexes, is no doubt one of the _principal_ reasons why the cares and ills of life sit lighter on the shoulders of that fantastic people, than on those of any other country in the world.

The French reckon an excursion dull, and a party of pleasure without relish, unless a mixture of both sexes join to compose in. The French women do not even withdraw from the table after meals; nor do the men discover that impatience to have them dismissed, which they so often do in England.

It is alleged by those who have no relish for the conversation of the fair sex, that their presence curbs the freedom of speech, and restrains the jollity of mirth. But, if the conversation and the mirth are decent, if the company are capable of relishing any thing but wine, the very reverse is the case. Ladies, in general, are not only more cheerful than gentlemen, but more eager to promote mirth and good humor.

So powerful, indeed, are the company and conversation of the fair, in diffusing happiness and hilarity, that even the cloud which hangs on the _thoughtful brow_ of an Englishman, begins in the present age to brighten, by his devoting to the ladies a larger share of time than was formerly done by his ancestors.

Though the influence of the sexes be reciprocal, yet that of the ladies is certainly the greatest. How often may one see a company of men, who were disposed to be riotous, checked at once into decency by the accidental entrance of an amiable woman; while her good sense and obliging deportment charms them into at least a temporary conviction, that there is nothing so delightful as female conversation, in its best form! Were such conviction frequently repeated, what might we not expect from it at last?

"Were virtue," said an ancient philosopher, "to appear amongst men in a visible shape, what vehement desires would she enkindle!" Virtue, exhibited without affectation, by a lovely young person, of improved understanding and gentle manners, may be said to appear with the most alluring aspect, surrounded by the _Graces_.

It would be an easy matter to point out instances of the most evident reformation, wrought on particular men, by their having happily conceived a passion for virtuous women.

To form the manners of men, various causes contribute; but nothing, perhaps, so much as the turn of the women with whom they converse. Those who are most conversant with women of virtue and understanding, will be always found the most amiable characters, other circumstances being supposed alike. Such society, beyond every thing else, rubs off the _corners_ that gives many of our sex an ungracious roughness. It produces a polish more perfect, and more pleasing than that which is received from a general commerce with the world. This last is often specious, but commonly superficial. The other is the result of gentler feelings, and more humanity. The heart itself is moulded. Habits of undissembled courtesy are formed. A certain flowing urbanity is acquired. Violent passions, rash oaths, coarse jests, indelicate language of every kind, are precluded and disrelished.

Female society gives men a taste for cleanliness and elegance of person. Our ancestors, who kept but little company with their women, were not only slovenly in their dress, but had their countenances disfigured with long beards. By female influence, however, beards were, in process of time, mutilated down to mustaches. As the gentlemen found that the ladies had no great relish for mustaches, which were the relics of a beard, they cut and curled them into various fashions, to render them more agreeable. At last, however, finding such labor vain, they gave them up altogether. But as those of the three learned professions were supposed to be endowed with, or at least to stand in need of, more wisdom than other people, and as the longest beard had always been deemed to sprout from the wisest chin, to supply this mark of distinction, which they had lost, they contrived to smother their heads in enormous quantities of frizzled hair, that they might bear greater resemblance to an owl, the bird sacred to wisdom and Minerva.

To female society it has been objected by the learned and studious, that it enervates the mind, and gives it such a turn for trifling, levity, and dissipation, as renders it altogether unfit for that application which is necessary in order to become eminent in any of the sciences. In proof of this they allege, that the greatest philosophers seldom or never were men who enjoyed, or were fit for, the company or conversation of women. Sir Isaac Newton hardly ever conversed with any of the sex. Bacon, Boyle, Des Cartes, and many others, conspicuous for their learning and application, were but indifferent companions to the fair.

It is certain, indeed, that the youth who devotes his whole time and attention to female conversation, and the little offices of gallantry, never distinguishes himself in the literary world. But notwithstanding this, without the fatigue and application of severe study, he often obtains, by female interest, that which is denied to the merited improvements acquired by the labor of many years.

MONASTIC LIFE.

The venerable _Bede_ has given us a very striking picture of Monastic enormities, in his epistle to Egbert. From this we learn that many young men who had no title to the monastic profession, got possession of monasteries; where, instead of engaging in the defence of their country, as their age and rank required, they indulged themselves in the most dissolute indolence.

We learn from Dugdale, that in the reign of Henry the Second, the nuns of Amsbury abbey in Wiltshire were expelled from that religious house on account of their incontinence. And to exhibit in the most lively colors the total corruption of monastic chastity, bishop Burnet informs us in his "History of the Reformation," that when the nunneries were visited by the command of Henry the VIII. "whole houses almost, were found whose vows had been made in vain."

When we consider to what oppressive indolence, to what a variety of wretchedness and guilt, the young and fair inhabitants of the cloister were frequently betrayed, we ought to admire those benevolent authors who, when the tide of religious prejudice ran very strong in favor of monastic virginity, had spirit enough to oppose the torrent, and to caution the devout and tender sex against so dangerous a profession. It is in this point of view that the character of Erasmus appears with the most amiable lustre; and his name ought to be eternally dear to the female world in particular. Though his studies and constitution led him almost to idolize those eloquent fathers of the church who have magnified this kind of life, his good sense and his accurate survey of the human race, enabled him to judge of the misery in which female youth was continually involved by a precipitate choice of the veil. He knew the successful arts by which the subtle and rapacious monks inveigled young women of opulent families into the cloister; and he exerted his lively and delicate wit in opposition to so pernicious an evil.

In those nations of Europe where nunneries still exist, how many lovely victims are continually sacrificed to the avarice or absurd ambition of inhuman parents! The misery of these victims has been painted with great force by some benevolent writers of France.

In most of those pathetic histories that are founded on the abuse of convents, the misery originates from the parent, and falls upon the child. The reverse has sometime happened; and there are examples of unhappy parents, who have been rendered miserable by the religious perversity of a daughter. In the fourteenth volume of that very amusing work, _Les Causes Celebres_, a work which is said to have been the favorite reading of Voltaire, there is a striking history of a girl under age, who was tempted by pious artifice to settle herself in a convent, in express opposition to parental authority. Her parents, who had in vain tried the most tender persuasion, endeavored at last to redeem their lost child, by a legal process against the nunnery in which she was imprisoned. The pleadings on this remarkable trial may, perhaps, be justly reckoned amongst the finest pieces of eloquence that the lawyers of France have produced. Monsieur Gillet, the advocate for the parents, represented, in the boldest and most affecting language, the extreme baseness of this religious seduction. His eloquence appeared to have fixed the sentiments of the judges; but the cause of superstition was pleaded by an advocate of equal power, and it finally prevailed. The unfortunate parents of Maria Vernal (for this was the name of the unfortunate girl) were condemned to resign her forever, and to make a considerable payment to those artful

devotees who had piously robbed them of their child.

When we reflect on the various evils that have arisen in convents, we have the strongest reason to rejoice and glory in that reformation by which the nunneries of England were abolished. Yet it would not be candid or just to consider all these as the mere harbors of licentiousness; since we are told that, at the time of their suppression, some of our religious houses were very honorably distinguished by the purity of their inhabitants. "The visitors," says Bishop Burnet, "interceded earnestly for one nunnery in Oxfordshire, where there was great strictness of life, and to which most of the young gentlewomen of the country were sent to be bred; so that the gentry of the country desired the king would spare the house: yet all was ineffectual."

DEGREES OF SENTIMENTAL ATTACHMENT AT DIFFERENT PERIODS.

In the earlier ages, sentiment in love does not appear to have been much attended to. When Abraham sent his servant to court a bride for his son Isaac, we do not so much as hear that Isaac was consulted on the matter: nor is there even a suspicion, that he might refuse or dislike the wife which his father had selected for him.

From the manner in which Rebecca was solicited, we learn, that women were not then courted in person by the lover, but by a proxy, whom he, or his parents, deputed in his stead. We likewise see, that this proxy did not, as in modern times, endeavor to gain the affection of the lady he was sent to, by enlarging on the personal properties, and mental qualifications of the lover; but by the richness and magnificence of the presents he made to her and her relations.

Presents have been, from the earliest ages, and are to this day, the mode of transacting all kinds of business in the east. When a favor is to be asked of a superior, one cannot hope to obtain it without a present. Courtship, therefore, having been anciently transacted in this manner, it is plain, that it was only considered in the same light as any other negotiable business, and not as a matter of sentiment, and of the heart.

In the courtship, however, or rather purchase of a wife by Jacob, we meet with something like sentiment; for when he found that he was not possessed of money or goods, equal to the price which was set upon her, he not only condescended to purchase her by servitude, but even seemed much disappointed when the tender-eyed Leah was faithlessly imposed upon him instead of the beautiful Rachel.

The ancient Gauls, Germans, and neighboring nations of the North, had so much veneration for the sex in general, that in courtship they behaved with a spirit of gallantry, and showed a degree of sentiment, to which _those_ who called them barbarians, never arrived. Not contented with getting possession of the person of his mistress, a northern lover could not be satisfied without the sincere affection of her heart; nor was his mistress ever to be gained but by such methods as plainly indicated to her the tenderest attachment from the most deserving man.

The women of Scandinavia were not to be courted but by the most assiduous attendance, seconded by such warlike achievements as the custom of the country had rendered necessary to make a man deserving of his mistress. On these accounts, we frequently find a lover accosting the object of his passion by a minute and circumstantial detail of his exploits, and all his accomplishments. "We fought with swords," says King Regner, in a beautiful ode composed by himself, in memory of the deeds of his former days, "that day wherein I saw ten thousand of my foes rolling in the dust, near a promontory of England. A dew of blood distilled from our swords. The arrows which flew in search of the helmets, bellowed through the air. The pleasure of that day was truly exquisite.

"We fought with swords. A young man should march early to the conflict of arms. Man should attack man, or bravely resist him. In this hath always consisted the nobility of the warrior. He who aspires to the love of his mistress, ought to be dauntless in the clash of swords."

The descendants of the northern nations, long after they had plundered and repeopled the greatest part of Europe, retained nearly the same ideas of love, and practised the same methods in declaring it, that they had imbibed from their ancestors. "Love," says William of Montagnogout, "engages to the most amiable conduct. Love inspires the greatest actions. Love has no will but that of the object beloved, nor seeks any thing but what will augment her glory. You cannot love, nor ought to be beloved, if you ask any thing that virtue condemns. Never did I form a wish that could wound the heart of my beloved, nor delight in a pleasure that was inconsistent with her delicacy."

The method of addressing females, among some of the tribes of American Indians, is the most simple that can possibly be devised. When the lover goes to visit his mistress, he only begs leave, by signs, to enter her hut. After obtaining this, he goes in, and sits

down by her in the most respectful silence. If she suffers him to remain there without interruption, her doing so is consenting to his suit. If, however, the lover has any thing given him to eat and drink, it is a refusal; though the woman is obliged to sit by him until he has finished his repast. He then retires in silence.

In Canada, courtship is not carried on with that coy reserve, and seeming secrecy, which politeness has introduced among the inhabitants of civilized nations. When a man and a woman meet, though they never saw each other before, if he is captivated by her charms, he declares his passion in the plainest manner; and she, with the same simplicity, answers, Yes, or No, without further deliberation. "That female reserve," says an ingenious writer, [Dr Alexander,] "that seeming reluctance to enter into the married state, observable in polite countries, is the work of art, and not of nature. The history of every uncultivated people amply proves it. It tells us, that their women not only speak with freedom the sentiments of their hearts, but even blush not to have these sentiments made as public as possible."

In Formosa, however, they differ so much from the simplicity of the Canadians, that it would be reckoned the greatest indecency in the man to declare, or in the woman to hear, a declaration of the passion of love. The lover is, therefore, obliged to depute his mother, sister, or some female relation; and from any of these the soft tale may be heard without the least offence to delicacy.

In Spain, the women had formerly no voice in disposing of themselves in matrimony. But as the empire of common sense began to extend itself, they began to claim a privilege, at least of being consulted in the choice of the partners of their lives. Many fathers and guardians, hurt by this female innovation, and puffed up with Spanish pride, still insisted on forcing their daughters to marry according to their pleasure, by means of duennas, locks, hunger, and even sometimes of poison and daggers. But as nature will revolt against every species of oppression and injustice, the ladies have for some time begun to assert their own rights. The authority of fathers and guardians begins to decline, and lovers find themselves obliged to apply to the affections of the fair, as well as to the pride and avarice of their relations.

The nightly musical serenades of mistresses by their lovers are still in use. The gallant composes some love sonnets, as expressive as he can, not only of the situation of his heart, but of every particular circumstance between him and the lady, not forgetting to lard them with the most extravagant encomiums on her beauty and merit. These he sings in the night below her window accompanied with his lute, or sometimes with a whole band of music. The more piercingly cold the air, the more the lady's heart is supposed to be thawed with the patient sufferance of her lover, who, from night to night, frequently continues his exercises for many hours, heaving the deepest sighs, and casting the most piteous looks towards the window; at which if his goddess at last deigns to appear, and drops him a curtsey, he is superlatively paid for all his watching; but if she blesses him with a smile, he is ready to run distracted.

In Italy the manner of addressing the ladies, so far as it relates to serenading, nearly resembles that of Spain. The Italian, however, goes a step farther than the Spaniard. He endeavors to blockade the house where his fair one lives, so as to prevent the entrance of any rival. If he marries the lady who cost him all this trouble and attendance, he shuts her up for life: If not, she becomes the object of his eternal hatred, and he too frequently endeavors to revenge by poison the success of his happier rival.

In one circumstance relating to courtship, the Italians are said to be particular. They protract the time as long as possible, well knowing that even with all the little ills attending it, a period thus employed is one of the sweetest of human life.

A French lover, with the word sentiment perpetually in his mouth, seems by every action to have excluded it from his heart. He places his whole confidence in his exterior air and appearance. He dresses for his mistress, dances for her, flutters constantly about her, helps her to lay on her rouge, and to place her patches. He attends her round the whole circle of amusements, chatters to her constantly, whistles and sings, and plays the fool with her. Whatever be his station, every thing gaudy and glittering within the sphere of it is called in to his assistance, particularly splendid carriages and tawdry liveries; but if, by the help of all these, he cannot make an impression on the fair one's heart, it costs him nothing but a few shrugs of his shoulders, two or three silly exclamations, and as many stanzas of some satirical song against her; and, as it is impossible for a Frenchman to live without an amour, he immediately betakes himself to another.

There is hardly any such thing among people of fashion as courtship. Matters are generally so ordered by parents and guardians, that to a bride and bridegroom, the day of marriage is often the second time of their meeting. In many countries, to be married in this manner would be reckoned the greatest of misfortunes. In France it is little regarded. In the fashionable world, few people are greater strangers to, or more indifferent about each other, than husband and wife; and any appearance of fondness between them, or their being seen frequently together, would infallibly make them forfeit the reputation of the _ton_, and be laughed at by all polite

company. On this account, nothing is more common than to be acquainted with a lady without knowing her husband, or visiting the husband without ever seeing his wife.

GERMAN WOMEN.

Of all the German females, the ladies of Saxony are the most amiable. Their persons are so superiorly charming and preferable in whatever can recommend them to be notice of mankind, that the German youth often visit Saxony in quest of _companions_ for life. Exclusive of their beauty and comeliness of appearance, they are brought up in a knowledge of all those arts, both useful and ornamental, which are so brilliant an addition to their native attractions. But what chiefly enhances their value, and gives it reality and duration, is a _sweetness_ of temper and festivity of disposition, that never fail to endear them on a very slight acquaintance. To crown all, they are generally patterns of conjugal tenderness and fidelity.

As they are commonly careful to improve their minds by reading and instructive conversation, they have no small share of facetiousness and ingenuity. From their innate liveliness, they are extremely addicted to all the gay kind of amusements. They excel in the allurements of dress and decoration, and are in general skilful in music.

The character, however, of the women in most other parts of Germany, particularly of the Austrian, is very different from this. Notwithstanding the advantages of size and make, their looks and features, though not unsightly, betray a vacancy of that life and spirit, without which beauty is uninteresting, and, like a mere picture, becomes utterly void of that indication of sensibility, which alone can awaken a delicacy of feeling.

As their education is conducted by the rules of the grossest superstition, and they are taught little else than set forms of devotion, they arrive to the years of maturity uninstructed in the use of reason, and usually continue profoundly ignorant the remainder of their days, which are spent, or rather loitered away, in apathy and indolence.

The principal happiness of the Austrian ladies of fashion consists in ruminating on the dignity of their birth and families, the antiquity of their race, the rank they hold, the respect attached to it, and the prerogatives they enjoy over the inferior classes, whom they treat with the utmost superciliousness, and hold in the most unreasonable contempt. In the mean time, their domestic affairs are condemned to the most unaccountable neglect. They dwell at home, careless of what passes there; and suffer disorder and confusion to prevail, without feeling the least uneasiness. Great frequenters of churches, their piety consists in the strictest conformity to all the externals of religion. They profess the most boundless belief in all the silly legends with which their treatises of devotion are filled; and these are the only books they ever read. The coldness of their constitution occasions a species of regulated gallantry, which is rather the effect of an opinion that it is an appendage of high life, than the result of their natural inclination.

It must, at the same time be allowed, that the Austrian women are endowed with a great fund of sincerity and candor; and, though too much on the reserve, and prone to keep at an unnecessary distance, are yet capable of the truest attachment, and always warm and zealous in the cause of those whom they have admitted to their friendship.

Though the Germans are rather a dull and phlegmatic people, and not greatly enslaved by the warmer passions, yet at the court of Vienna they are much given to intrigue: and an amour is so far from being scandalous, that a woman gains credit by the rank of her gallant, and is reckoned silly and unfashionable if she scrupulously adheres to the virtue of chastity. But such customs are more the customs of courts, than of places less exposed to temptation, and consequently less dissolute; and we are well assured that in Germany there are many women who do honor to humanity, not by chastity only, but also by a variety of other virtues.

The ladies at the principal courts, differ not much in their dress from the French and English. They are not, however, so excessively fond of paint as the former. At some courts, they appear in rich furs: and all of them are loaded with jewels, if they can obtain them. The female part of the burgher's families, in many of the German towns, dress in a very different manner, and some of them inconceivably fantastic, as may be seen in many prints published in books of travels. But, in this respect, they are gradually reforming, and many of them make quite a different appearance in their dress from what they did thirty or forty years ago.

The inhabitants of Vienna lived luxuriously, a great part of their time being spent in feasting and carousing. In winter, when the different branches of the Danube are frozen over, and the ground covered with snow, the ladies take their recreation in sledges of different shapes, such as griffins, tigers, swans, scallop-shells, etc. Here the lady sits, dressed in velvet lined with rich furs, and adorned with laces and jewels, having on her head a velvet cap. The sledge is drawn by one horse, stag or other creature, set off with plumes of feathers, ribbons and bells. As this diversion is taken chiefly in the night time, servants ride before the sledge with torches; and a gentleman, standing on the sledge behind, guides the horse.

A VIEW OF MATRIMONY IN THREE DIFFERENT LIGHTS.

The marriage life is always an insipid, a vexatious, or a happy condition, the first is, when two people of no taste meet together, upon such a settlement as has been thought reasonable by parents and conveyancers, from an exact valuation of the land and cash of both parties. In this case the young lady's person is no more regarded than the house and improvements in purchase of an estate; but she goes with her fortune, rather than her fortune with her. These make up the crowd or vulgar of the rich, and fill up the lumber of the human race, without beneficence towards those below them, or respect towards those above them; and lead a despicable, independent, and useless life, without sense of the laws of kindness, good-nature, mutual offices, and the elegant satisfactions which flow from reason and virtue.

The vexatious life arises from a conjunction of two people of quick taste and resentment, put together for reasons well known to their friends, in which especial care is taken to avoid (what they think the chief of evils) poverty; and ensure them riches with every evil besides. These good people live in a constant restraint before company, and when alone, revile each other's person and conduct. In company they are in purgatory; when by themselves, in hell.

The happy marriage is, where two persons meet, and voluntarily make choice of each other without principally regarding or neglecting the circumstances of fortune or beauty. These may still love in spite of adversity or sickness. The former we may in some measure defend ourselves from; the other is the common lot of humanity. Love has nothing to do with riches or state. Solitude, with the person beloved, has a pleasure, even in a woman's mind, beyond show or pomp.

BETROTHING AND MARRIAGE.

At a very early period, families who lived in a friendly manner, fell upon a method of securing their children to each other by what is called in the sacred writings Betrothing. This was agreeing on a price to be paid for the bride, the time when it should be paid, and when she should be delivered into the hands of her husband.

There were, according to the Talmudists, three ways of betrothing. The first by a written contract. The second, by a verbal agreement, accompanied with a piece of money. And the third, by the parties coming together, and living as husband and wife; which might as properly be called marriage as betrothing.

The written contract was in the following manner--"On such a day, month, year, A the son of B, has said to D the daughter of E, be thou my spouse according to the law of Moses and of the Israelites; and I give thee as a dowry the sum of two hundred suzims, as it is ordered by our law. And the said D hath promised to be his spouse upon the conditions aforesaid, which the said A doth promise to perform on the day of marriage. And to this the said A doth hereby bind himself and all that he hath, to the very cloak upon his back; engages himself to love, honor, feed, clothe, and protect her, and to perform all that is generally implied in contracts of marriage in favor of the Israelitish wives."

The verbal agreement was made in the presence of a sufficient number of witnesses, by the man saying to the women, "Take this money as a pledge that at such a time I will take thee to be my wife." A woman who was thus betrothed or bargained for, was almost in every respect by the law considered as already married.

Before the legislation of Moses, "marriages among the Jews," say the Rabbies, "were agreed on by the parents and relations of both sides. When this was done, the bridegroom was introduced to his bride. Presents were mutually exchanged, the contract signed before witnesses, and the bride, having remained sometime with her relations, was sent away to the habitation of her husband, in the night, with singing, dancing, and the sound of musical instruments."

By the institution of Moses, the Rabbies tell us the contract of marriage was read in the presence of, and signed by, at least ten witnesses, who were free, and of age. The bride, who had taken care to bathe herself the night before, appeared in all her splendor, but veiled, in imitation of Rebecca, who veiled herself when she came in sight of Isaac. She was then given to the bridegroom by her parents, in words to this purpose: "Take her according to the law of Moses." And he received her, by saying, "I take her according to that law." Some blessings were then pronounced on the young couple, both by the parents and the rest of the company.

The blessings or prayers generally run in this style: "Blessed art thou, O Lord of heaven, and earth, who has created man in thine own likeness, and hast appointed woman to be his partner and companion! Blessed art thou, who fillest Zion with joy for the multitude of her children! Blessed art thou who sendest gladness to the bridegroom and his bride; who hast ordained for them, love,

joy, tenderness, peace and mutual affection. Be pleased to bless not only this couple, but Judah and Jerusalem, with songs of joy, and praise for the joy that thou givest them, by the multitudes of their sons and of their daughters."

After the virgins had sung a marriage song, the company partook of a repast, the most magnificent the parties could afford; after which they began a dance, the men round the bridegroom, the women round the bride. They pretended that this dance was of divine institution and an essential part of the ceremony. The bride was then carried to the nuptial bed, and the bridegroom left with her. The company again returned to their feasting and rejoicing; and the Rabbies inform us, that this feasting, when the bride, was a widow, lasted only three days, but seven if she was a virgin.

At the birth of a son, the father planted a cedar; and at that of a daughter, he planted a pine. Of these trees the nuptial bed was constructed, when the parties, at whose birth they were planted, entered into the married state.

The Assyrians had a court, or tribunal whose only business was to dispose of young women in marriage, and see the laws of that union properly executed. What these laws were, or how the execution of them was enforced, are circumstances that have not been handed down to us. But the erecting a court solely for the purpose of taking cognizance of them, suggests an idea that they were many and various.

Among the Greeks, the multiplicity of male and female deities who were concerned in the affairs of love, made the invocations and sacrifices on a matrimonial occasion a very tedious affair. Fortunate omens gave great joy, and the most fortunate of all others was a pair of turtles seen in the air, as those birds were reckoned the truest emblems of conjugal love and fidelity. If, however, one of them was seen alone it infallibly denoted separation, and all the ills attending an unhappy marriage.

On the wedding day, the bride and bridegroom were richly dressed, and adorned with garlands of herbs and flowers. The bride was conducted in the evening to the house of her husband in a chariot, seated between her husband and one of his relations. When she alighted from the chariot the axle-tree of it was burnt to show that there was no method for her to return back. As soon as the young couple entered the house, figs and other fruits were thrown upon their heads to denote plenty; and a sumptuous entertainment was ready for them to partake of, to which all the relations on both sides were invited.

The bride was lighted to bed by a number of torches, according to her quality; and the company returned in the morning to salute the new married couple, and to sing _epithalamia_ at the door of their bed-chamber.

Epithalamia were marriage songs, anciently sung in praise of the bride or bridegroom, wishing them happiness, prosperity and a numerous issue.

Among the Romans there were three different kinds of marriage. The ceremony of the first consisted in the young couple eating a cake together made only of wheat, salt and water. The second kind was celebrated by the parties solemnly pledging their faith to each other, by giving and receiving a piece of money. This was the most common way of marrying among the Romans. It continued in use, even after they became Christians. When writings were introduced to testify that a man and a woman had become husband and wife, and also, that the husband had settled a dower upon his bride, these writings were called _Tabulae Dotales_ (dowry tables;) and hence, perhaps the words in our marriage ceremony, "I thee endow."

The third kind of marriage was, when a man and woman, having cohabited for some time and had children, found it expedient to continue together. In this case, if they made up the matter between themselves, it became a valid marriage, and the children were considered as legitimate.

Something similar to this is the present custom in Scotland. There, if a man live with, and have children by a woman, though he do not marry her till he be upon his death-bed, all the children are thereby legitimated and become entitled to the honors and estates of their father. The case is the same in Holland and some parts of Germany; with this difference only, that all the children to be legitimated must appear with the father and mother in church at the ceremony of their marriage.

FEMALE FRIENDSHIP.

It has long been a question, Which of the two sexes is most capable of friendship? Montague, who is so much celebrated for his knowledge of human nature, has given it positively against the women; and his opinion has been generally embraced.

Friendship perhaps, in women, is more rare than among men; but, at the same time, it must be allowed that where it is found, it is more tender.

Men, in general, have more of the parade than the graces of friendship. They often wound while they serve; and their warmest sentiments are not very enlightened, with respect to those minute sentiments which are of so much value. But women have a refined sensibility, which makes them see every thing; nothing escapes them. They divine the silent friendship; they encourage the bashful or timid friendship; they offer the sweetest consolations to friendship in distress. Furnished with finer instruments, they treat more delicately a wounded heart. They compose it, and prevent it from feeling its agonies. They know, above all, how to give value to a thousand things, which have no value in themselves.

We ought therefore, perhaps, to desire the friendship of a man upon great occasions; but, for general happiness, we must prefer the friendship of a woman.

With regard to female intimacies, it may be taken for granted that there is no young woman who has not, or wishes not to have, a companion of her own sex, to whom she may unbosom herself on every occasion. That there are women capable of friendship with women, few impartial observers will deny. There have been many evident proofs of it, and those carried as far as seemed compatible with the imperfections of our common nature. It is, however, questioned by some; while others believe that it happens exceedingly seldom. Between married and unmarried women, it no doubt happens very often; whether it does so between those that are single, is not so certain. Young men appear more frequently susceptible of a generous and steady friendship for each other, than females as yet unconnected; especially, if the latter have, or are supposed to have, pretensions to beauty, not adjusted by the public.

In the frame and condition of females, however, compared with those of the other sex, there are some circumstances which may help towards an apology for this unfavorable feature in their character.

The state of matrimony is necessary to the support, order, and comfort of society. But it is a state that subjects the women to a great variety of solicitude and pain. Nothing could carry them through it with any tolerable satisfaction or spirit, but very strong and almost unconquerable attachments. To produce these, is it not fit they should be peculiarly sensible to the attention and regards of the men? Upon the same ground, does it not seem agreeable to the purposes of Providence, that the securing of this attention, and these regards, should be a principal aim? But can such an aim be pursued without frequent competition? And will not that too readily occasion jealousy, envy, and all the unamiable effects of mutual _rivalship_? Without the restraints of superior worth and sentiment, it certainly will. But can these be ordinarily expected from the prevailing turn of female education; or from the little pains that women, as well as other human beings, commonly take to _control_ themselves, and to act nobly? In this _last_ respect, the sexes appear pretty much on the same footing.

This reasoning is not meant to justify the indulgence of those little and sometimes base passions towards one another, with which females have been so generally charged. It is only intended to represent such passions in the first approach; and, while not entertained, as less criminal than the men are apt to state them; and to prove that, in their attachments to each other, the latter have not always that merit above the women, which they are apt to claim. In the mean time, let it be the business of the ladies, by emulating the gentlemen, where they appear good-natured and disinterested, to disprove their imputation, and to show a temper open to _friendship_ as well as to _love_.

To talk much of the latter is natural for both; to talk much of the former, is considered by the men as one way of doing themselves honor. Friendship, they well know, is that dignified form, which, in speculation at least every heart must respect.

But in friendship, as in religion, which on many accounts it resembles, speculation is often substituted in the place of practice. People fancy themselves possessed of the thing, and hope that others will fancy so too, because they are fond of the name, and have learned to talk about it with plausibility. Such talk indeed imposes, till experience give it the lie.

To say the truth, there seems in either sex but little of what a fond imagination, unacquainted with the falsehood of the world, and warmed by affections which its selfishness has not yet chilled, would reckon friendship. In theory, the standard is raised too high; we ought not, however, to wish it much lower. The honest sensibilities of ingenuous nature should not be checked by the over-cautious maxims of political prudence. No advantage, obtained by such frigidity, can compensate for the want of those warm effusions of the heart into the bosom of a friend, which are doubtless among the most exquisite pleasures. At the same time, however, it must be owned, that they often by the inevitable lot of humanity, make way for the bitterest pains which the breast can experience. Happy beyond the common condition of her sex, is she who has found a friend indeed; open hearted, yet discreet; generously fervent, yet steady; thoroughly virtuous, but not severe; wise, as well as cheerful! Can such a friend be loved too much, or cherished too tenderly? If to excellence and happiness there be any one way more compendious than another, next to friendship

with the Supreme Being, it is this.

But when a mixture of minds so beautiful and so sweet takes place, it is generally, or rather always the result of early prepossession, casual intercourse, or in short, a combination of such causes as are not to be brought together by management or design. This noble plant may be cultivated; but it must grow spontaneously.

ON THE CHOICE OF A HUSBAND.

Assist me, ye Nine, While the youth I define, With whom I in wedlock would class; And ye blooming fair, Lend a listening ear, To approve of the man as you pass.

Not the changeable fry Who love, nor know why, But follow bedup'd by their passions: Such votaries as these Are like waves of the seas, And steer'd by their own inclinations.

The hectoring blade How unfit for the maid, Where meekness and modesty reigns! Such a blundering bully I'll speak against truly, Whatever I get for my pains.

Not the dogmatic elf, Whose great all is himself, Whose alone _ipse dixit_ is law: What a figure he'll make, How like Momus he'll speak With sneering burlesque, a pshaw! pshaw!

Not the covetous wretch Whose heart's at full stretch To gain an inordinate treasure; Him leave with the rest, And such mortals detest, Who sacrifice life without measure.

The fluttering fop, How empty his top! Nay, but some call him coxcomb, I trow; But 'tis losing your time, He's not worth half a rhyme, Let the fag ends of prose bind his brow.

The guttling sot, What a conduit his throat! How beastly and vicious his life! Where drunkards prevail, Whole families feel, Much more an affectionate wife.

One character yet; I with sorrow repeat, And O! that the number were less; 'Tis the blasphemous crew: What a pattern they'll shew To their hapless and innocent race!

Let wisdom then shine In the youth that is mine, Whilst virtue his footsteps impress; Such I'd choose for my mate, Whether sooner or late: Tell me, Ladies, what think you of this?

"The chief point to be regarded," says Lady Pennington in her Advice to her Daughters, "in the choice of a companion for life, is a really virtuous principle--an unaffected goodness of heart. Without this, you will be continually shocked by indecency, and pained by impiety. So numerous have been the unhappy victims to the ridiculous opinion, _a reformed libertine makes the best husband_--that, did not experience daily evince the contrary, one would believe it impossible for a girl who has a tolerable degree of common understanding, to be made the dupe of so erroneous a position, which has not the least shadow of reason for its foundation, and which a small share of observation will prove to be false in fact. A man who has been conversant with the worst sort of women, is very apt to contract a bad opinion of, and a contempt for, the sex in general. Incapable of esteeming any, he is suspicious of all; jealous without cause, angry without provocation, his own disturbed imagination is a continued source of ill-humor. To this is frequently joined a bad habit of body, the natural consequence of an irregular life, which gives an additional sourness to the temper. What rational prospect of happiness can there be with such a companion? And, that this is the general character of those who are called _reformed rakes_, observation will certify. But, admit there may be some exceptions, it is a hazard upon which no considerate woman would venture the peace of her whole life. The vanity of those girls who believe themselves capable of working miracles of this kind, and who give up their persons to men of libertine principles, upon the wild expectation of reclaiming them, justly deserves the disappointment which it will generally meet with; for, believe me, a wife is, of all persons, the least likely to succeed in such an attempt. Be it your care to find that virtue in a lover which you must never hope to form in a husband. Good sense, and good nature, are almost equally requisite. If the former is wanting, it will be next to an impossibility for you to esteem the person, of whose behavior you may have cause to be ashamed. Mutual esteem is as essential to happiness in the married state, as mutual affection. Without the latter, every day will bring with it some fresh cause of vexation, until repeated quarrels produce a coldness, which will settle into an irreconcilable aversion, and you will become, not only each other's torment, but the object of contempt to your family, and to your acquaintance.

"This quality of good nature is, of all others, the most difficult to be ascertained, on account of the general mistake of blending it with good-humor, as if they were in themselves the same; whereas, in fact, no two principles of action are more essentially different. But this may require some explanation. By good nature, I mean that true benevolence, which partakes in the felicity of every individual within the reach of its ability, which relieves the distressed, comforts the afflicted, diffuses blessings, and communicates happiness, far as its sphere of action can extend; and which, in the private scenes of life, will shine conspicuous in the dutiful son, in the affectionate husband, the indulgent father, the faithful friend, and in the compassionate master both to man and beast. Good humor, on the other hand, is nothing more than a cheerful, pleasing deportment, arising either from a natural gaiety of mind, or from an affection of popularity, joined to an affability of behavior, the result of good breeding, and from a ready compliance with the taste of every company. This kind of mere good humor is, by far, the most striking quality. It is frequently mistaken for and complimented with the superior name of _real good nature_. A man, by this specious appearance, has often acquired that appellation who, in all the actions of private life, has been a morose, cruel, revengeful, sullen, haughty tyrant. Let them put on the cap, whose temples fit the galling wreath!

"A man of a truly benevolent disposition, and formed to promote the happiness of all around him, may sometimes, perhaps, from an ill habit of body, an accidental vexation, or from a commendable openness of heart, above the meanness of disguise, be guilty of little sallies of peevishness, or of ill humor, which, carrying the appearance of ill nature, may be unjustly thought to proceed from it, by persons who are unacquainted with his true character, and who, take ill humor and ill nature to be synonymous terms, though in reality they bear not the least analogy to each other. In order to the forming a right judgment, it is absolutely necessary to observe this distinction, which will effectually secure you from the dangerous error of taking the shadow for the substance, an irretrievable mistake, pregnant with innumerable consequent evils!

"From what has been said, it plainly appears, that the criterion of this amiable virtue is not to be taken for the general opinion; mere good humor being, to all intents and purposes, sufficient in this particular, to establish the public voice in favor of a man utterly devoid of every humane and benevolent affection of heart. It is only from the less conspicuous scenes of life, the more retired sphere of action, from the artless tenor of domestic conduct, that the real character can, with any certainty be drawn. These, undisguised, proclaim the man. But, as they shun the glare of light, nor court the noise of popular applause, they pass unnoticed, and are seldom known till after an intimate acquaintance. The best method, therefore, to avoid the deception in this case, is to lay no stress on outward appearances, which are too often fallacious, but to take the rule of judging from the simple unpolished sentiments of those whose dependent connections give them undeniable certainty; who not only see, but who hourly feel, the good or bad effect of that disposition, to which they are subjected. By this, I mean, that if a man is equally respected, esteemed, and beloved by his dependants and domestics, you may justly conclude, he has that true good nature, that real benevolence, which delights in communicating felicity, and enjoys the satisfaction it diffuses. But if by these he is despised and hated, served merely from a principle of fear, devoid of affection, which is ever easily discoverable, whatever may be his public character, however favorable the general opinion, be assured, that his disposition is such as can never be productive of domestic happiness. I have been the more particular on this head, as it is one of the most essential qualifications to be regarded, and of all others the most liable to be mistaken.

"Never be prevailed with, my dear, to give your hand to a person defective in these material points. Secure of virtue, of good nature, and understanding, in a husband, you may be secure of happiness. Without the two former it is unattainable. Without the latter in a tolerable degree, it must be very imperfect.

"Remember, however, that infallibility is not the property of man, or you may entail disappointment on yourself, by expecting what is never to be found. The best men are sometimes inconsistent with themselves. They are liable to be hurried, by sudden starts of passion, into expressions and actions, which their _cooler_ reason will condemn. They may have some oddities of behavior, and some peculiarities of temper. They may be subject to accidental ill humor, or to whimsical complaints. Blemishes of this kind often shade the brightest character; but they are never destructive of mutual felicity, unless when they are made so by an improper resentment, or by an ill-judged opposition. When cooled, and in his usual temper, the man of understanding, if he has been wrong, will suggest to himself all that could be urged against him. The man of good nature will, unupbraided, own his error. Immediate contradiction is, therefore, wholly unserviceable, and highly imprudent; an after repetition is equally unnecessary and injudicious. Any peculiarities in the temper or behavior ought to be properly represented in the tenderest and in the most friendly manner. If the representation of them is made discreetly, it will generally be well taken. But if they are so habitual as not easily to be altered, strike not too often upon the unharmonious string. Rather let them pass unobserved. Such a cheerful compliance will better cement your union; and they may be made easy to yourself, by reflecting on the superior good qualities by which these trifling faults are so

greatly overbalanced.

"You must remember, my dear, these rules are laid down on the supposition of your being united to a person who possesses the three qualifications for happiness before mentioned. In this case no farther direction is necessary, but that you strictly perform the duty of a wife, namely, to love, to honor, and obey. The two first articles are a tribute so indispensably due to _merit_, that they must be paid by _inclination_--and they naturally lead to the performance of the last, which will not only be easy, but a pleasing task, since nothing can ever be enjoined by such a person that is in itself improper, and a few things will, that can, with any reason, be disagreeable to you.

"The being united to a man of irreligious principles, makes it impossible to discharge a great part of the proper duty of a wife. To name but one instance, obedience will be rendered impracticable, by frequent injunctions inconsistent with, and contrary to, the higher obligations of morality. This is not a supposition, but is a certainty founded upon facts, which I have too often seen and can attest. Where this happens, the reasons for non-compliance ought to be offered in a plain, strong, good natured manner. There is at least the chance of success from being heard. But should those reasons be rejected, or the hearing them refused, and silence on the subject enjoined, which is most probable, few people caring to hear what they know to be right, when they are determined not to be convinced by it--obey the injunction, and urge not the argument farther. Keep, however, steady to your principles, and suffer neither persuasion nor threats to prevail on you to act contrary to them. All commands repugnant to the laws of christianity, it is your indispensable duty to disobey. All requests that are inconsistent with prudence, or incompatible with the rank and character which you ought to maintain in life, it is your interest to refuse. A compliance with the former would be criminal, a consent to the latter highly indiscreet; and it might thereby subject you to general censure. For a man, capable of requiring, from his wife, what he knows to be in itself wrong, is equally capable of throwing the whole blame of such misconduct on her, and of afterwards upbraiding her for a behavior, to which he will, upon the same principle, disown that he has been accessary. Many similar instances have come within the compass of my own observation. In things of less material nature, that are neither criminal in themselves, nor pernicious in their consequences, always acquiesce, if insisted on, however disagreeable they may be to your own temper and inclination. Such a compliance will evidently prove that your refusal, in the other cases, proceeds not from a spirit of contradiction, but merely from a just regard to that superior duty which can never be infringed with impunity.

"As the want of understanding is by no art to be concealed, by no address to be disguised, it might be supposed impossible for a woman of sense to unite herself to a person whose defect, in this instance, must render that sort of rational society, which constitutes the chief happiness of such an union, impossible. Yet here, how often has the weakness of female judgment been conspicuous! The advantages of great superiority in rank or fortune have frequently proved so irresistible a temptation, as, in opinion, to outweigh, not only the folly, but even the vices of its possessor--a grand mistake, ever tacitly acknowledged by a subsequent repentance, when the expected pleasures of affluence, equipage, and all the glittering pageantry, have been experimentally found insufficient to make amends for the want of that constant satisfaction which results from the social joy of conversing with a reasonable friend!

"But however weak this motive must be acknowledged, it is more excusable than another, which, I fear, has sometimes had an equal influence on the mind--I mean so great a love of sway, as to induce her to give the preference to a person of weak intellectuals, in hopes of holding, uncontrolled, the reins of government. The expectation is, in fact, ill grounded. Obstinacy and pride are generally the companions of folly. The silliest people are often the most tenacious of their opinions, and, consequently, the hardest of all others to be managed. But admit the contrary, the principle is in itself bad. It tends to invert the order of nature, and to counteract the design of Providence.

"A woman can never be seen in a more ridiculous light than when she appears to govern her husband. If, unfortunately, the superiority of understanding is on her side, the apparent consciousness of that superiority betrays a weakness, that renders her contemptible in the sight of every considerate person, and it may, very probably, fix in his mind a dislike never to be eradicated. In such a case, if it should ever be your own, remember that some degree of dissimulation is commendable, so far as to let your husband's defects appear unobserved. When he judges wrong, never flatly contradict, but lead him insensibly into another opinion, in so discreet a manner, that it may seem entirely his own, and let the whole credit of every prudent determination rest on him, without indulging the foolish vanity of claiming any merit to yourself. Thus a person of but an indifferent capacity, may be so assisted, as, in many instances, to shine with borrowed lustre, scarce distinguishable from the native, and by degrees he may be brought into a kind of mechanical method of acting properly, in all the common occurrences of life. Odd as this position may seem, it is founded in fact. I have seen the method successfully practised by more than one person, where a weak mind, on the governed side, has been so prudently set off as to appear the sole director; like the statue of the Delphic god, which was thought to give forth

its own oracles, whilst the humble priest, who lent his voice, was by the shrine concealed, nor sought a higher glory than a supposed obedience to the power he would be thought to serve."

A LETTER TO A NEW MARRIED MAN.

I received the news of your marriage with infinite delight, and hope that the sincerity with which I wish you happiness, may excuse the liberty I take in giving you a few rules, whereby more certainly to obtain it. I see you smile at my wrong-headed kindness, and, reflecting on the charms of your bride, cry out in a rapture, that you are happy enough without any rules. I know you are. But after one of the forty years, which I hope you will pass pleasingly together, is over, this letter may come in turn, and rules for felicity may not be found unnecessary, however some of them may appear impracticable.

Could that kind of love be kept alive through the marriage state, which makes the charm of a single one, the sovereign good would no longer be sought for; in the union of two faithful lovers it would be found: but reason shows that this is impossible, and experience informs us that it never was so; we must preserve it as long, and supply it as happily as we can.

When your present violence of passion subsides, however, and a more cool and tranquil affection takes its place, be not hasty to censure yourself as indifferent, or to lament yourself as unhappy; you have lost that only which it was impossible to retain, and it were graceless amid the pleasures of a prosperous summer to regret the blossoms of a transient spring. Neither unwarily condemn your bride's insipidity till you have recollected that no object however sublime, no sounds however charming, can continue to transport us with delight when they no longer strike us with novelty. The skill to renovate the powers of pleasing is said indeed to be possessed by some women in an eminent degree; but the artifices of maturity are seldom seen to adorn the innocence of youth: you have made your choice, and ought to approve it.

Satiety follows quickly upon the heels of possession; and to be happy, we must always have something in view. The person of your lady is already all your own, and will not grow more pleasing in your eyes I doubt, though the rest of your sex will think her handsome for these dozen of years. Turn therefore all your attention to her mind, which will daily grow brighter by polishing. Study some easy science together, and acquire a similarity of tastes while you enjoy a community of pleasures. You will by this means have many images in common, and be freed from the necessity of separating to find amusement. Nothing is so dangerous to wedded love as the possibility of either being happy out of the company of the other: endeavor therefore, to cement the present intimacy on every side; let your wife never be kept ignorant of your income, your expenses, your friendships, or aversions; let her know your very faults, but make them amiable by your virtues; consider all concealment as a breach of fidelity; let her never have any thing to find out in your character; and remember, that from the moment one of the partners turns spy upon the other, they have commenced a state of hostility.

Seek not for happiness in singularity; and dread a refinement of wisdom as a deviation into folly. Listen not to those sages who advise you always to scorn the counsel of a woman, and if you comply with her requests pronounce you to be wife-ridden.

I said that the person of your lady would not grow more pleasing to you; but pray let her never suspect that it grows less so: that a woman will pardon an affront to her understanding much sooner than one to her person, is well known; nor will any of us contradict the assertion. All our attainments, all our arts, are employed to gain and keep the heart of man: and what mortification can exceed the disappointment, if the end be not obtained? There is no reproof however pointed, no punishment however severe, that a woman of spirit will not prefer to neglect; and if she can endure it without complaint, it only proves that she means to make herself amends by the attention of others for the slights of her husband. For this, and for every reason, it behoves a married man not to let his politeness fail, though his ardor may abate, but to retain at least that general civility towards his own lady which he is so willing to pay to every other, and not show a wife of eighteen or twenty years old, that every man in company can treat her with more complaisance than he, who so often vowed to her eternal fondness.

It is not my opinion that a young woman should be indulged in every wild wish of her gay heart or giddy head; but contradiction may be softened by domestic kindness, and quiet pleasures substituted in the place of noisy ones. Public amusements are not indeed so expensive as is sometimes imagined, but they tend to alienate the minds of married people from each other. A well chosen society of friends and acquaintance, more eminent for virtue and good sense than for gaiety and splendor, where the conversation of the day may afford comment for the evening, seems the most rational pleasure this great town can afford.

That your own superiority should always be seen, but never felt, seems an excellent general rule. A wife should outshine her husband in nothing, not even in her dress. The bane of married happiness among the city men in general has been, that finding

themselves unfit for polite life, they transferred their vanity to their ladies, dressed them up gaily, and sent them out a gallanting, while the good man was to regale with port wine or rum punch, perhaps among mean companions, after the compting house was shut. This practice produced the ridicule thrown on them in all our comedies and novels since commerce began to prosper. But now that I am so near the subject, a word or two on jealousy may not be amiss; for though not a failing of the present age's growth, yet the seeds of it are too certainly sown in every warm bosom, for us to neglect it as a fault of no consequence. If you are ever tempted to be jealous, watch your wife narrowly--but never tease her; tell her your jealousy but conceal your suspicion; let her, in short, be satisfied that it is only your odd temper, and even troublesome attachment, that makes you follow her; but let her not dream that you ever doubted seriously of her virtue even for a moment. If she is disposed towards jealousy of you, let me beseech you to be always explicit with her and never mysterious: be above delighting in her pain, of all things--nor do your business nor pay your visits with an air of concealment, when all you are doing might as well be proclaimed perhaps in the parish vestry. But I hope better than this of your tenderness and of your virtue, and will release you from a lecture you have so little need of, unless your extreme youth and my uncommon regard will excuse it. And now farewell; make my kindest compliments to your wife, and be happy in proportion as happiness is wished you by, Dear Sir, &c.

GARRICK'S ADVICE TO MARRIED LADIES.

Ye fair married dames who so often deplore That a lover once blest is a lover no more; Attend to my counsel, nor blush to be taught That prudence must cherish what beauty has caught.

The bloom on your cheek, and the glance of your eye, Your roses and lilies may make the men sigh; But roses, and lilies, and sighs pass away, And passion will die as your beauties decay.

Use the man that you wed like your fav'rite guitar, Though music in both, they are both apt to jar; How tuneful and soft from a delicate touch, Not handled too roughly, nor play'd on too much!

The sparrow and linnet will feed from your hand, Grow tame by your kindness, and come at command: Exert with your husband the same happy skill, For hearts, like your birds, may be tamed to your will.

Be gay and good-humour'd, complying and kind, Turn the chief of your care from your face to your mind; 'Tis thus that a wife may her conquests improve, And Hymen shall rivet the fetters of love.

ORIGIN OF NUNNERIES.

Soon after the introduction of Christianity, St. Mark is said to have founded a society called Therapeutes, who dwelt by the lake Moeris in Egypt, and devoted themselves to solitude and religious offices. About the year 305 of the christian computation, St. Anthony being persecuted by Dioclesian, retired into the desert near the lake Moeris; numbers of people soon followed his example, joined themselves to the Therapeutes; St. Anthony being placed at their head, and improving upon their rules, first formed them into regular monasteries, and enjoined them to live in mortification and chastity. About the same time, or soon after, St. Synclitica, resolving not to be behind St. Anthony in her zeal for chastity, is generally believed to have collected together a number of enthusiastic females, and to have founded the first nunnery for their reception. Some imagine the scheme of celibacy was concerted between St. Anthony and St. Synclitica, as St. Anthony, on his first retiring into solitude, is said to have put his sister into a nunnery, which must have been that of St. Synclitica; but however this be, from their institution, monks and nuns increased so fast, that in the city of Orixa, about seventeen years after the death of St. Anthony, there were twenty thousand virgins devoted to celibacy.

Such at this time was the rage of celibacy; a rage which, however unnatural, will cease to excite our wonder, when we consider, that it was accounted by both sexes the sure and only infallible road to heaven and eternal happiness; and as such, it behoved the church vigorously to maintain and countenance it, which she did by beginning about this time to deny the liberty of marriage to her sons. In the first council of Nice, held soon after the introduction of christianity, the celibacy of the clergy was strenuously argued for, and some think that even in an earlier period it had been the subject of debate; however this be, it was not agreed to in the council of Nice, though at the end of the fourth century it is said that Syricus, bishop of Rome, enacted the first decree against the marriage of monks; a decree which was not universally received: for several centuries after, we find that it was not uncommon for clergymen to have wives; even the popes were allowed this liberty, as it is said in some of the old statutes of the church, that it was lawful for the pope to marry a virgin for the sake of having children. So exceedingly difficult is it to combat against nature, that little regard seems to have been paid to this decree of Syricus; for we are informed, that several centuries after, it was no uncommon

thing for the clergy to have wives, and perhaps even a plurality of them; as we find it among the ordonnances of pope Sylvester, that every priest should be the husband of one wife only; and Pius the Second affirmed, that though many strong reasons might be adduced in support of the celibacy of the clergy, there were still stronger reasons against it.

DESCRIPTION OF THE GREAT CONVENT AT AJUDA IN RIO JANERIO.

At the end of the chapel is a large quadrangle, entered by a massive gateway, surrounded by three stories of grated windows. Here female negro pedlars come with their goods, and expose them in the court-yard below. The nuns, from their grated windows above, see what they like, and, letting down a cord, the article is fastened to it; it is then drawn up and examined, and, if approved of, the price is let down. Some that I saw in the act of buying and selling in this way, were very merry, joking and laughing with the blacks below, and did not seem at all indisposed to do the same with my companion. In three of the lower windows, on a level with the court-yard, are revolving cupboards, like half-barrels, and at the back of each is a plate of tin, perforated like the top of a nutmeg-grater. The nuns of this convent are celebrated for making sweet confectionary, which people purchase. There is a bell which the purchaser applies to, and a nun peeps through the perforated tin; she then lays the dish on a shelf of the revolving cupboard, and turns it inside out; the dish is taken, the price laid in its place, and it is turned in. While we stood there, the invisible lady-warder asked for a pinch of snuff; the box was laid down in the same way, and turned in and out.

CEREMONY OF THE INITIATION OF A NUN.

The disposition to take the veil, even among young girls, is not uncommon in Brazil. The opposition of friends can prevent it, until they are twenty five years old; but after that time they are considered competent to decide for themselves. A writer describes the initiation of a young lady, whose wealthy parents were extremely reluctant to have her take the vow. She held a lighted torch in her hand, in imitation of the prudent virgins; and when the priest chanted, "Your spouse approaches; come forth and meet him," she approached the altar singing, "I follow with my whole heart;" and, accompanied by two nuns already professed, she knelt before the bishop. She seemed very lovely, with an unusually sweet, gentle, and pensive countenance. She did not look particularly or deeply affected; but when she sung her responses, there was something exceedingly mournful in the soft, tremulous, and timid tones of her voice. The bishop now exhorted her to make a public profession of her vows before the congregation, and said, "Will you persevere in your purpose of holy chastity?" She blushed deeply, and, with a downcast look, lowly, but firmly answered, "I will." He again said, more distinctly, "Do you promise to preserve it?" and she replied more emphatically, "I do promise." The bishop then said, "Thanks be to God;" and she bent forward and reverently kissed his hand, while he asked her, "Will you be blest and consecrated?" She replied, "Oh! I wish it."

The habiliments, in which she was hereafter to be clothed, were sanctified by the aspersion of holy water: then followed several prayers to God, that "As he had blessed the garments of Aaron, with ointment which flowed from his head to his beard, so he would now bless the garments of his servant, with the copious dew of his benediction." When the garment was thus blessed, the girl retired with it; and having laid aside the dress in which she had appeared, she returned, arrayed in her new attire, except her veil. A gold ring was next provided, and consecrated with a prayer, that she who wore it "might be fortified with celestial virtue, to preserve a pure faith, and incorrupt fidelity to her spouse, Jesus Christ." He last took the veil, and her female attendants having uncovered her head, he threw it over her, so that it fell on her shoulders and bosom, and said, "Receive this sacred veil, under the shadow of which you may learn to despise the world, and submit yourself truly, and with all humility of heart, to your Spouse;" to which she sung a response, in a very sweet, soft, and touching voice: "He has placed this veil before my face that I should see no lover but himself."

The bishop now kindly took her hand, and held it while the following hymn was chanted by the choir with great harmony: "Beloved Spouse, come--the winter is passed--the turtle sings, and the blooming vines are redolent of summer."

A crown, a necklace, and other female ornaments, were now taken by the bishop and separately blessed; and the girl bending forward, he placed them on her head and neck, praying that she might be thought worthy "to be enrolled into the society of the hundred and forty-four thousand virgins, who preserved their chastity and did not mix with the society of impure women."

Last of all, he placed the ring on the middle finger of her right hand, and solemnly said, "So I marry you to Jesus Christ, who will henceforth be your protector. Receive this ring, the pledge of your faith, that you may be called the spouse of God." She fell on her knees, and sung, "I am married to him whom angels serve, whose beauty the sun and moon admire;" then rising, and showing with exultation her right hand, she said, emphatically, as if to impress it on the attention of the congregation, "My Lord has wedded me

with this ring, and decorated me with a crown as his spouse. I here renounce and despise all earthly ornaments for his sake, whom alone I see, whom alone I love, in whom alone I trust, and to whom alone I give all my affections. My heart hath uttered a good word: I speak of the deed I have done for my King." The bishop then pronounced a general benediction, and retired up to the altar; while the nun professed was borne off between her friends, with lighted tapers, and garlands waving.

WEDDED LOVE IS INFINITELY PREFERABLE TO VARIETY.

Hail, wedded love, mysterious law, true source Of human offspring, sole propriety, In Paradise of all things common else!

By thee adult'rous lust was driven from men, Among the bestial herds to range; by thee, Founded in reason, loyal, just and pure, Relations dear, and all the charities Of father, son, and brother, first were known.

Thou art the fountain of domestic sweets, Whose bed is undefiled and chaste pronounced. Here Love his golden shafts employs, here lights His constant lamp, and waves his purple wings, Reigns here and revels; not in the bought smile Of harlots, loveless, joyless, unendear'd, Casual fruition; nor in court amours, Mix'd dance, or wanton mask, or midnight ball, Or serenade, which the starved lover sings To his proud fair, best quitted with disdain.

ITALIAN DEBAUCHERY.

If chastity is none of the most shining virtues of the French, it is still less so of the Italians. Almost all the travellers who have visited Italy, agree in describing it as the most abandoned of all the countries of Europe. At Venice, at Naples, and indeed in almost every part of Italy, women are taught from their infancy, the various arts of alluring to their arms, the young and unwary, and of obtaining from them, while heated by love or wine, every thing that flattery and false smiles can obtain in those unguarded moments: and so little infamous is the trade of prostitution, and so venal the women, that hardly any rank or condition set them above being bribed to it, nay, they are frequently assisted by their male friends and acquaintances to drive a good bargain; nor does their career of debauchery finish with their unmarried state; the vows of fidelity which they make at the altar, are like the vows and oaths made upon too many other occasions, only considered as nugatory forms, which law has obliged them to take, but custom absolved them from performing. They even claim and enjoy greater liberties after marriage than before; every married woman has a cicisbey, or gallant, who attends her to all public places, hands her in and out of her carriage, picks up her gloves or fan, and a thousand other little offices of the same natures; but this is only his public employment, as a reward for which, he is entitled to have the lady as often as he pleases at a place of retirement sacred to themselves, where no person not even the most intrusive husband must enter, to be witness of what passes between them. This has been considered by people of other nations, as a custom not altogether consistent with chastity and purity of manners; the Italians themselves however, endeavor to justify it in their conversations with strangers, and Baretti has of late years published a formal vindication of it to the world. In this vindication he has not only deduced the original of it from pure Platonic love, but would willingly persuade us that it is still continued upon the same mental principles; a doctrine which the world will hardly be credulous enough to swallow, even though he should offer more convincing arguments to support it than he has already done.

NAKED FAKIERS

So different over all the world are the sects of saints as well as of sinners, that besides the Bramins, a set of innocent and religious priests, who have rendered their women virtuous by treating them with kindness and humanity, there are another sect of religio-philosophical drones, called Fakiers, who contribute as much as they can to debauch the sex, under a pretence of superior sanctity. These hypocritical saints, like some of the ridiculous sects which formerly existed in Europe, wear no clothes; considering them only as proper appendages to sinners, who are ashamed, because they are sensible of guilt; while they, being free from every stain of pollution, have no shame to cover. In this original state of nature, these idle and pretended devotees, assemble together sometimes in armies of ten or twelve thousand, and under a pretence of going in pilgrimage to certain temples, like locusts devour every thing on their way; the men flying before them, and carrying all that they can out of the reach of their depredations; while the women, not in the least afraid of a naked army of lusty saints, throw themselves in their way, or remain quietly at home to receive them.

It has long been an opinion, well established all over India, that there is not in nature so powerful a remedy for removing the sterility of women, as the prayers of these sturdy naked saints. On this account, barren women constantly apply to them for assistance; which when the good natured Fakier has an indication to grant, he leaves his slipper, or his staff at the door of the lady's apartment

with whom he is praying; a symbol so sacred, that it effectually prevents any one from violating the secrecy of their devotion; but should he forget this signal, and at the same time be distant from the protection of his brethren, a sound drubbing is frequently the reward of his pious endeavors. But though they venture sometimes in Hindostan, to treat a Fakier in this unholy manner, in other parts of Asia and Africa, such is the veneration in which these lusty saints are held, that they not only have access when they please, to perform private devotions with barren women, but are accounted so holy, that they may at any time, in public or private, confer a personal favor upon a woman, without bringing upon her either shame or guilt; and no woman dare refuse to gratify their passion. Nor indeed, has any one an inclination of this kind; because she, upon whom this personal favor has been conferred, is considered by herself, and by all the people, as having been sanctified and made more holy by the action.

So much concerning the conduct of the Fakiers in debauching women, seems certain. But it is by travellers further related, that wherever they find a woman who is exceedingly handsome, they carry her off privately to one of their temples; but in such a manner, as to make her and the people believe, that she is carried away by the god who is there worshipped; who being violently in love with her, took that method to procure her for his wife. This done, they perform a nuptial ceremony, and make her further believe that she is married to the god; when, in reality, she is only married to one of the Fakiers who personates him. Women who are treated in this manner are revered by the people as the wives of the gods, and by that stratagem secured solely to the Fakiers, who have cunning enough to impose themselves as gods upon some of these women, through the whole of their lives. In countries where reason is stronger than superstition, we almost think this impossible: where the contrary is the case, there is nothing too hard to be credited. Something like this was done by the priests of ancient Greece and Rome; and a few centuries ago, tricks of the same nature were practiced by the monks, and other libertines, upon some of the visionary and enthusiastic women of Europe. Hence we need not think it strange, if the Fakiers generally succeed in attempts of this nature; when we consider that they only have to deceive a people brought up in the most consummate ignorance; and that nothing can be more flattering to female vanity, than for a woman to suppose herself such a peculiar favorite of the divinity she worships, as to be chosen, from all her companions, to the honor of being admitted to his embraces; a favor, which her self-admiration will dispose her more readily to believe than examine.

MAHOMETAN PLURALITY OF WIVES.

But it is not the religion of the Hindoos only, that is unfavorable to chastity; that of Mahomet which now prevails over a great part of India, is unfavorable to it likewise. Mahometanism every where indulges men with a plurality of wives while it ties down the women to the strictest conjugal fidelity; hence, while the men riot in unlimited variety, the women are in great numbers confined to share among them the scanty favors of one man only. This unnatural and impolitic conduct induces them to seek by art and intrigue, what they are denied by the laws of their prophet. As polygamy prevails over all Asia, this art and intrigue follow as the consequence of it; some have imagined, that it is the result of climate, but it rather appears to be the result of the injustice which women suffer by polygamy; for it seems to reign, as much in Constantinople, and in every other place where polygamy is in fashion, as it does on the banks of the Ganges, or the Indus. The famous Montesquieu, whose system was, that the passions are entirely regulated by the climate, brings as a proof of this system, a story from the collection of voyages for the establishment of an East India Company, in which it is said, that at Patan, "the wanton desires of the women are so outrageous, that the men are obliged to make use of a certain apparel to shelter them from their designs." Were this story really true, it would be but a partial proof of the effect of climate, for why should the burning suns of Patan only influence the passions of the fair? Why should they there transport that sex beyond decency, which in all other climates is the most decent? And leave in so cool and defensive a state, that sex, which in all other climates is apt to be the most offensive and indecent? To whatever length the spirit of intrigue may be carried in Asia and Africa, however the passions of the women may prompt them to excite desire, and to throw themselves in the way of gratification, we have the strongest reasons to reprobate all these stories, which would make us believe, that they are so lost to decency as to attack the other sex: such a system would be overturning nature, and inverting the established laws by which she governs the world.

WOMEN OF OTAHEITE.

In Otaheite, an island in the Southern Ocean, we are presented with women of a singular character. As far as we can recollect, we think it is a pretty general rule, that whatever the sex are accustomed to be constantly clothed, they are ashamed to appear naked: those of Otaheite seem however to be an exception to this rule; to show themselves in public, with or without clothing, appears to be to them a matter of equal indifference, and the exposition of any part of their bodies, is not attended with the least backwardness or reluctance; circumstances from which we may reasonably infer, that among them, clothes were not originally invented to cover shame, but either as ornaments, or as a defence against the cold. But a still more striking singularity in the character of these

women, and which distinguishes them not only from the females of all other nations, but likewise from those of almost all other animals, is, their performing in public those rites, which in every other part of the globe, and among almost all animals, are performed in privacy and retirement: whether this is the effect of innocence, or of a dissoluteness of manners to which no other people have yet arrived, remains still to be discovered; that they are dissolute, even beyond any thing we have hitherto recorded, is but too certain. As polygamy is not allowed among them, to satisfy the lust of variety, they have a society called Arreoy, in which every woman is common to every man; and when any of these women happens to have a child, it is smothered in the moment of its birth, that it may not interrupt the pleasures of its infamous mother; but in this juncture, should nature relent at so horrid a deed, even then the mother is not allowed to save her child, unless she can find a man who will patronise it as a father; in which case, the man is considered as having appropriated the woman to himself, and she is accordingly extruded from this hopeful society. These few anecdotes sufficiently characterise the women of this island.

CRIM. CON. OF CLAUDIUS AND POMPEIA.

Our own times furnish us with an instance of a ceremony from which all women are carefully excluded;[2] but the Roman ladies, in performing the rites sacred to the good goddess, were even more afraid of the men than our masons are of women; for we are told by some authors, that so cautious were they of concealment, that even the statutes and pictures of men and other male animals were hood-winked with a thick veil. The house of the consul, though commonly so large that they might have been perfectly secured against all intrusion in some remote apartment of it, was obliged to be evacuated by all male animals, and even the consul himself was not suffered to remain in it. Before they began their ceremonies, every corner and lurking place in the house was carefully searched, and no caution omitted to prevent all possibility of being discovered by impertinent curiosity, or disturbed by presumptive intrusion. But these cautions were not all the guard that was placed around them; The laws of the Romans made it death for any man to be present at the solemnity.

Such being the precautions, and such the penalties for insuring the secrecy of this ceremony, it was only once attempted to be violated, though it existed from the foundation of the Roman empire till the introduction of Christianity; and this attempt was made, not so much perhaps with a view to be present at the ceremony, as to fulfil an assignation with a mistress. Pompeia, the wife of Caesar, having been suspected of a criminal correspondence with Claudius, and so closely watched that she could find no opportunity of gratifying her passion, at last, by the means of a female slave, settled an assignation with him at the celebration of the rites of the good goddess. Claudius was directed to come in the habit of a singing girl, a character he could easily personate, being young and of a fair complexion. As soon as the slave saw him enter, she ran to inform her mistress. The mistress eager to meet her lover, immediately left the company and threw herself into his arms, but could not be prevailed upon by him to return so soon as he thought necessary for their mutual safety; upon which he left her, and began to take a walk through the rooms, always avoiding the light as much as possible. While he was thus walking by himself, a maid servant accosted him, and desired him to sing; he took no notice of her, but she followed and urging him so closely, that he was at last obliged to speak. His voice betrayed his sex; the maid servant shrieked, and running into the room where the rites were performing, told that a man was in the house. The women in the utmost consternation, threw a veil ever the mysteries, ordered the doors to be secured, and with lights in their hands, ran about the house searching for the sacrilegious intruder. They found him in the apartment of the slave who had admitted him, drove him out with ignominy, and, though it was in the middle of the night immediately dispersed, to give an account to their husbands of what had happened. Claudius was soon after accused of having profaned the holy rites; but the populace declaring in his favor, the judges, fearing an insurrection, were obliged to acquit him.

[2] Masonry

A WORD TO A VERY NICE CLASS OF LADIES.

There is amongst us a female character, not uncommon, which we denominate the outrageously virtuous. Women of this stamp never fail to seize all opportunities of exclaiming, in the bitterest manner, against every one upon whom even the slightest suspicion of indiscretion or unchastity has fallen; taking care, as they go along, to magnify every mole-hill into a mountain, and every thoughtless freedom into the blackest of crimes. But besides the illiberality of thus treating such as may frequently be innocent, you may credit us, dear countrywomen, when we aver, that such a behavior, instead of making you appear more virtuous, only draws down upon you, by those who know the world, suspicions not much to your advantage. Your sex are in general suspected by ours, of being too much addicted to scandal and defamation; a suspicion, which has not arisen of late years, as we find in the ancient laws of England a punishment, known by the name of ducking-stool, annexed to scolding and defamation in the women, though no such punishment nor crime is taken notice of in the men. This crime, however, we persuade ourselves, you are less guilty of, than

is commonly believed: but there is another of a nature not more excusable, from which we cannot so much exculpate you; which is, that harsh and forbidding appearance you put on, and that ill treatment, which you no doubt think necessary, for the illustration of your own virtue, you should bestow on every one of your sex who has deviated from the path of rectitude. A behaviour of this nature, besides being so opposite to that meek and gentle spirit which should distinguish female nature, is in every respect contrary to the charitable and forgiving temper of the Christian religion, and infallibly shuts the door of repentance against an unfortunate sister, willing, perhaps, to abandon the vices into which heedless inadvertency had plunged her, and from which none of you can promise yourselves an absolute security.

We wish not, fair countrywomen, like the declaimer and satirist, to paint you all vice and imperfection, nor, like the venal panegyrist, to exhibit you all virtue. As impartial historians, we confess that you have, in the present age, many virtues and good qualities, which were either nearly or altogether unknown to your ancestors; but do you not exceed them in some follies and vices also? Is not the levity, dissipation, and extravagance of the women of this century arrived to a pitch unknown and unheard of in former times? Is not the course which you steer in life, almost entirely directed by vanity and fashion? And are there not too many of you who, throwing aside reason and good conduct, and despising the counsel of your friends and relations, seem determined to follow the mode of the world, however it may be mixed with vice? Do not the generality of you dress, and appear above your station, and are not many of you ashamed to be seen performing the duties of it? To sum up all, do not too, too many of you act as if you thought the care of a family, and the other domestic virtues, beneath your attention, and that the sole end for which you were sent into the world, was to please and divert yourselves, at the expense of those poor wretches the men, whom you consider as obliged to support you in every kind of idleness and extravagance? While such is your conduct, and while the contagion is every day increasing, you are not to be surprised if the men, still fond of you as playthings in the hours of mirth and revelry, ever shun serious connection with you; and while they wish to be possessed of your charms, are so much afraid of your manners and conduct, that they prefer the cheerless state of a bachelor, to the numberless evils arising from being tied to a modern wife.

CUSTOM IN THE MOGUL EMPIRE.

In a variety of parts of the Mogul empire, when the women are carried abroad, they are put into a kind of machine like a chariot, and placed on the backs of camels, or in covered sedan chairs, and surrounded by a guard of eunuchs and armed men, in such a manner, that a stranger would rather suppose the cavalcade to be carrying some desperate villain to execution, than employed to prevent the intrigues or escape of a defenceless woman. At home, the sex are covered with gauze veils, which they dare not take off in the presence of any man, except their husband, or some near relation. Over the greatest part of Asia, and some parts of Africa, women are guarded by eunuchs, made incapable of violating their chastity. In Spain, where the natives are the descendants of the Africans, and whose jealousy is not less strong than that of their ancestors, they, for many centuries, made use of padlocks to secure the chastity of their women; but finding these ineffectual, they frequently had recourse to old women, called Gouvernantes. It had been discovered, that men deprived of their virility, did not guard female virtue so strictly, as to be incapable of being bribed to allow another a taste of those pleasures they themselves were incapable of enjoying. The Spaniards, sensible of this, imagined, that vindictive old women were more likely to be incorruptible; as envy would stimulate them to prevent the young from enjoying those pleasures, which they themselves had no longer any chance for; but all powerful gold soon overcame even this obstacle; and the Spaniards, at present, seem to give up all restrictive methods, and to trust the virtue of their women to good principles, instead of rigor and hard usage.

CUSTOM OF THE MUSCOVITES.

If the laws forbidding the marriage of near relations with each other, originated from the political view of preserving the human race from degeneracy, they are the only laws we meet with on that subject, and exert almost the only care we find taken of so important a matter. The Asiatic is careful to improve the breed of his elephants, the Arabian of his horses, and the Laplander of his reindeer. The Englishman, eager to have swift horses, staunch dogs, and victorious cocks, grudges no care and spares no expense, to have the males and females matched properly; but since the days of Solon, where is the legislator, or since the days of the ancient Greeks, where are the private persons who take any care to improve, or even to keep from degeneracy the breed of their own species? The Englishman who solicitously attends the training of his colts and puppies, would be ashamed to be caught in the nursery; and while no motive could prevail upon him to breed horses or hounds from an improper or contaminated kind, he will calmly, or rather inconsiderately, match himself with the most decrepid or diseased of the human species; thoughtless of the weaknesses and evils he is going to entail on posterity, and considering nothing but the acquisition of fortune he is by her alliance to convey to an offspring, by diseases rendered unable to use it. The Muscovites were formerly the only people, besides the

Greeks, who paid a proper attention to this subject. After the preliminaries of a marriage were settled between the parents of a young couple, the bride was stripped naked, and carefully examined by a jury of matrons, when if they found any bodily defect they endeavored to cure it; but if it would admit of no remedy, the match was broke off, and she was considered not only as a very improper subject to breed from, but improper also for maintaining the affections of a husband, after he had discovered the imposition she had put upon him.

SALE OF CHILDREN TO PURCHASE WIVES.

In Timor, an island in the Indian Ocean, it is said, that parents sell their children in order to purchase more wives. In Circassia, women are reared and improved in beauty and every alluring art, only for the purpose of being sold. The prince of the Circassians demanded of the prince of Mingrelia an hundred slaves loaded with tapestry, an hundred cows, as many oxen, and the same number of horses, as the price of his sister. In New-Zealand, we meet with a custom which may be called purchasing a wife for a night, and which is proof that those must also be purchased who are intended for a longer duration; and what to us is a little supprising, this temporary wife, insisted upon being treated with as much deference and respect, as if she had been married for life; but in general, this is not the case in other countries, for the wife who is purchased, is always trained up in the principles of slavery; and, being inured to every indignity and mortification from her parents, she expects no better treatment from her husband.

There is little difference in the condition of her who is put to sale by her sordid parents, and her who is disposed of in the same manner by the magistrates, as a part of the state's property. Besides those we have already mentioned in this work, the Thracians put the fairest of their virgins up to public sale, and the magistrates of Crete had the sole power of choosing partners in marriage for their young men; and, in the execution of this power, the affection and interest of the parties was totally overlooked, and the good of the state the only object of attention; in pursuing which, they always allotted the strongest and best made of the sex to one another, that they might raise up a generation of warriors, or of women fit to be the mothers of warriors.

POLYGAMY AND CONCUBINAGE.

Polygamy and concubinage having in process of time become fashionable vices, the number of women kept by the great became at last more an article of grandeur and state, than a mode of satisfying the animal appetite: Solomon had threescore queens, and fourscore concubines, and virgins without number. Maimon tells us, that among the Jews a man might have as many wives as he pleased, even to the number of a hundred, and that it was not in their power to prevent him, provided he could maintain, and pay them all the conjugal debt once a week; but in this duty he was not to run in arrear to any of them above a month, though with regard to concubines he might do as he pleased.

It would be an endless task to enumerate all the nations which practised polygamy; we shall, therefore, only mention a few, where the practice seemed to vary something from the common method. The ancient Sabaeans are not only said to have had a plurality, but even a community of wives; a thing strongly inconsistent with that spirit of jealousy which prevails among men in most countries where polygamy is allowed. The ancient Germans were so strict monogamists,[3] that they reckoned it a species of polygamy for a woman to marry a second husband even after the death of the first. "A woman (say they) has but one life, and but one body, therefore should have but one husband;" and besides, they added, "that she who knows she is never to have a second husband, will the more value and endeavor to promote the happiness and preserve the life of the first." Among the Heruli this idea was carried farther, a woman was obliged to strangle herself at the death of her husband, lest she should, afterwards marry another; so detestable was polygamy in the North, while in the East it is one of these rights which they most of all others esteem, and maintain with such inflexible firmness, that it will probably be one of the last of those that it will wrest out of their hands.

The Egyptians, it is probable, did not allow of polygamy, and as the Greeks borrowed their institutions from them, it was also forbid by the laws of Cecrops, though concubinage seems either to have been allowed or overlooked; for in the Odyssey of Homer we find Ulysses declaring himself to be the son of a concubine, which he would probably not have done, had any degree of infamy been annexed to it. In some cases, however, polygamy was allowed in Greece, from a mistaken notion that it would increase population. The Athenians, once thinking the number of their citizens diminished, decreed that it should be lawful for a man to have children by another woman as well as by his wife; besides this, particular instances occur of some who have transgressed the law of monogamy. Euripides is said to have had two wives, who, by their constant disagreement, gave him a dislike to the whole sex; a supposition which receives some weight from these lines of his in Andromache:

ne'er will I commend More beds, more wives than one, nor children curs'd With double mothers, banes and plagues of life.

Socrates too had two wives, but the poor culprit had as much reason to repent of his temerity as Euripides.

[3] Monogamy is having only one wife.

EUNUCHS.

As the appetite towards the other sex is one of the strongest and most ungovernable in our nature; as it intrudes itself more than any other into our thoughts, and frequently diverts them from every other purpose or employment; it may, at first, on this account, have been reckoned criminal when it interfered with worship and devotion; and emasculation was made use of in order to get rid of it, which may, perhaps, have been the origin of Eunuchs. But however this be, it is certain, that there were men of various religions who made themselves incapable of procreation on a religious account, as we are told that the priests of Cybele constantly castrated themselves; and by our Saviour, that there are eunuchs who make themselves such for the kingdom of heaven's sake.

GIRLS SOLD AT AUCTION.

The ancient Assyrians seem more thoroughly to have settled and digested the affairs of marriage, than any of their cotemporaries. Once in every year they assembled together all the girls that were marriageable, when the public crier put them up to sale, one after another. For her whose figure was agreeable, and whose beauty was attracting, the rich strove against each other, who should give the highest price; which price was put into a public stock, and distributed in portions to those whom nobody would accept without a reward. After the most beautiful were disposed of, these were also put up by the crier, and a certain sum of money offered with each, proportioned to what it was thought she stood in need of to bribe a husband to accept her. When a man offered to accept of any of them, on the terms upon which she was exposed to sale, the crier proclaimed that such a man had proposed to take such a woman, with such a sum of money along with her, provided none could be found who would take her with less; and in this manner the sale went on, till she was at last allotted to him who offered to take her with the smallest portion.--When this public sale was over, the purchasers of those that were beautiful were not allowed to take them away, till they had paid down the price agreed on, and given sufficient security that they would marry them; nor, on the other hand, would those who were to have a premium for accepting of such as were less beautiful, take a delivery of them, till their portions were previously paid.

SALE OF A WIFE.

In England, the sale of a wife sometimes occurs, even at the present day, of which the following is an example, from the Lancaster Herald.

"_Sale of a wife at Carlisle_--The inhabitants of this city lately witnessed the sale of a wife by her husband, Joseph Thompson, who resides in a small village about three miles distant, and rents a farm of about forty-two or forty-four acres. She was a spruce, lively, buxom damsel, apparently not exceeding twenty-two years of age, and appeared to feel a pleasure at the exchange she was about to make. They had no children during their union, and that, with some family disputes, caused them by mutual agreement to come to the resolution of finally parting. Accordingly, the bellman was sent round to give public notice of the sale, which was to take place at twelve o'clock; and this announcement attracted the notice of thousands. She appeared above the crowd, standing on a large oak chair, surrounded by many of her friends, with a rope or halter, made of straw, round her neck, being dressed in rather a fashionable country style, and appearing to some advantage. The husband, who was also standing in an elevated position near her, proceeded to put her up for sale, and spoke nearly as follows:--'Gentlemen, I have to offer to your notice my wife, Mary Anne Thompson, otherwise Williamson, whom I mean to sell to the highest and fairest bidder. It is her wish as well as mine to part for ever. I took her for my comfort, and the good of my house, but she has become my tormentor and a domestic curse, &c. &c. Now I have shown you her faults and failings, I will explain her qualifications and goodness. She can read fashionable novels and milk cows; she can laugh and weep with the same ease that you can take a glass of ale; she can make butter, and scold the maid; she can sing Moore's melodies, and plait her frills and caps; she cannot make rum, gin, or whiskey, but she is a good judge of their quality from long experience in tasting them, I therefore offer her, with all her perfections and imperfections, for the sum of fifty shillings.'--After an hour or two, she was purchased by Henry Mears, a pensioner, for the sum of twenty shillings and a Newfoundland dog. The happy pair immediately left town together, amidst the shouts and huzzas of the multitude, in which they were joined by Thompson, who, with the greatest good-humor imaginable, proceeded to put the halter, which his wife had taken off, round the neck of his Newfoundland dog, and then proceeded to the first public house, where he spent the remainder of the day."

PUNISHMENT OF ADULTERY.

As fidelity to the marriage-bed, especially on the part of woman, has always been considered as one of the most essential duties of matrimony, wise legislators, in order to secure that benefit have annexed punishment to the act of adultery; these punishments, however, have generally some reference to the manner in which wives were acquired, and to the value stamped upon woman by civilization and politeness of manners. It is ordained by the Mosaic code, that both the men and the women taken in adultery shall be stoned to death; whence it would seem, that no more latitude was given to the male than to the female. But this is not the case; such an unlimited power of concubinage was given to the men, that we may suppose him highly licentious indeed, who could not be satisfied therewith, without committing adultery. The Egyptians, among whom women were greatly esteemed, had a singular method of punishing adulterers of both sexes; they cut off the privy parts of the man, that he might never be able to debauch another woman; and the nose of the woman, that she might never be the object of temptation to another man.

Punishments nearly of the same nature, and perhaps nearly about the same time, were instituted in the East Indies against adulterers; but while those of the Egyptians originated from a love of virtue and of their woman, those of the Hindoos probably arose from jealousy and revenge. It is ordained by the Shaster, that if a man commit adultery with a woman of a superior cast, he shall be put to death; if by force he commit adultery with a woman of an equal or inferior cast, the magistrate shall confiscate all his possessions, cut off his genitals, and cause him to be carried round the city, mounted on a ass. If by fraud he commit adultery with a woman of an equal or inferior cast, the magistrate shall take his possessions, brand him in the forehead, and banish him the kingdom. Such are the laws of the Shaster, so far as they regard all the superior casts, except the Bramins; but if any of the most inferior casts commit adultery with a woman of the casts greatly superior, he is not only to be dismembered, but tied to a hot iron plate, and burnt to death; whereas the highest casts may commit adultery with the very lowest, for the most trifling fine; and a Bramin, or priest, can only suffer by having the hair of his head cut off; and, like the clergy of Europe, while under the dominion of the Pope, he cannot be put to death for any crime whatever. But the laws, of which he is always the interpreter, are not so favorable to his wife; they inflict a severe disgrace upon her, if she commit adultery with any of the higher casts; but if with the lowest, the magistrate shall cut off her hair, anoint her body with Ghee, and cause her to be carried through the whole city, naked, and riding upon an ass; and shall cast her out on the north side of the city, or cause her to be eaten by dogs. If a woman of any of the other casts goes to a man, and entices him to have criminal correspondence with her, the magistrate shall cut off her ears, lips and nose, mount her upon an ass, and drown her, or throw her to the dogs. To the commission of adultery with a dancing girl, or prostitute, no punishment nor fine is annexed.

ANECDOTE OF CAESAR.

When Caesar had subdued all his competitors, and most of the foreign nations which made war against him, he found that so many Romans had been destroyed in the quarrels in which he had often engaged them, that, to repair the loss, he promised rewards to fathers of families, and forbade all Romans who were above twenty, and under forty years of age, to go out of their native country. Augustus, his successor, to check the debauchery of the Roman youth, laid heavy taxes upon such as continued unmarried after a certain age, and encouraged with great rewards, the procreation of lawful children. Some years afterwards, the Roman knights having pressingly petitioned him that he would relax the severity of that law, he ordered their whole body to assemble before him, and the married and unmarried to arrange themselves in two separate parties, when, observing the unmarried to be much the greater company, he first addressed those who had complied with his law, telling them, that they alone had served the purposes of nature and society; that the human race was created male and female to prevent the extinction of the species; and that marriage was contrived as the most proper method of renewing the children of that species. He added, that they alone deserved the name of men and fathers, and that he would prefer them to such offices, as they might transmit to their posterity. Then turning to the bachelors, he told them, that he knew not by what name to call them; not by that of men, for they had done nothing that was manly; nor by that of citizens, since the city might perish for them; nor by that of Romans, for they seemed determined to let the race and name become extinct; but by whatever name he called them, their crime, he said, equalled all other crimes put together, for they were guilty of murder, in not suffering those to be born who should proceed from them; of impiety, in abolishing the names and honors of their fathers and ancestors; of sacrilege, in destroying their species, and human nature, which owed its original to the gods, and was consecrated to them; that by leading a single life they overturned, as far as in them lay, the temples and altars of the gods; dissolved the government, by disobeying its laws; betrayed their country, by making it barren. Having ended his speech, he doubled the rewards and privileges of such as had children, and laid a heavy fine on all unmarried persons, by reviving the Poppaean law.

Though by this law all the males above a certain age were obliged to marry under a severe penalty, Augustus allowed them the space of a full year to comply with its demands; but such was the backwardness to matrimony, and perversity of the Roman

knights, and others, that every possible method was taken to evade the penalty inflicted upon them, and some of them even married children in the cradle for that purpose; thus fulfilling the letter, they avoided the spirit of the law, and though actually married, had no restraint upon their licentiousness, nor any incumbrance by the expense of a family.

POWER OF MARRYING.

Among nations which had shaken off the authority of the church of Rome, the priests still retained almost an exclusive power of joining men and women together in marriage. This appears rather, however, to have been by the tacit consent of the civil power, than from any defect in its right and authority; for in the time of Oliver Cromwell, marriages were solemnized frequently by the justices of the peace; and the clergy neither attempted to invalidate them, nor make the children proceeding from them illegitimate; and when the province of New England was first settled, one of the earliest laws of the colony was, that the power of marrying should belong to the magistrates. How different was the case with the first French settlers in Canada! For many years a priest had not been seen in the country, and a magistrate could not marry: the consequence was natural; men and woman joined themselves together as husband and wife, trusting to the vows and promises of each other. Father Charlevoix, a Jesuit, at last travelled into those wild regions, found many of the simple, innocent inhabitants living in that manner; with all of whom he found much fault, enjoined them to do penance, and afterwards married them. After the Restoration, the power of marrying again reverted to the clergy. The magistrate, however, had not entirely resigned his right to that power; but it was by a late act of parliament entirely surrendered to them, and a penalty annexed to the solemnization of it by any other person whatever.

CELIBACY OF THE CLERGY.

At a synod held at Winchester under St. Dunstan, the monks averred, that so highly criminal was it for a priest to marry, that even a wooden cross had audibly declared against the horrid practice. Others place the first attempt of this kind, to the account of Aelfrick, archbishop of Canterbury, about the beginning of the eleventh century; however this may be, we have among the canons a decree of the archbishops of Canterbury, and York, ordaining, That all ministers of God, especially priests, should observe chastity, and not take wives: and in the year 1076, there was a council assembled at Winchester, under Lanfranc, which decreed, that no canon should have a wife; that such priests as lived in castles and villages should not be obliged to put their wives away, but that such as had none should not be allowed to marry; and that bishops should not ordain priests or deacons, unless they previously declared that they were not married. In the year 1102, archbishop Anselm held a council at Westminster, where it was decreed, that no archdeacon, priest, deacon, or canon, should either marry a wife, or retain her if he had one. Anselm, to give this decree greater weight, desired of the king, that the principal men of the kingdom might be present at the council, and that the decree might be enforced by the joint consent both of the clergy and laity; the king consented, and to these canons the whole realm gave a general sanction. The clergy of the province of York, however, remonstrated against them, and refused to put away their wives; the unmarried refused also to oblige themselves to continue in that state; nor were the clergy of Canterbury much more tractable.

In the celibacy of the clergy, we may discover also the origin of nunneries; the intrigues they could procure, while at confession, were only short, occasional, and with women whom they could not entirely appropriate to themselves; to remedy which, they probably fabricated the scheme of having religious houses, where young women should be shut up from the world, and where no man but a priest, on pain of death, should enter. That in these dark retreats, secluded from censure, and from the knowledge of the world, they might riot in licentiousness. They were sensible, that women, surrounded with the gay and the amiable, might frequently spurn at the offers of a cloistered priest, but that while confined entirely to their own sex, they would take pleasure in a visit from one of the other, however slovenly and unpolished. In the world at large, should the crimes of the women be detected, the priests have no interest in mitigating their punishment; but here the whole community of them are interested in the secret of every intrigue, and should Lucinda unluckily proclaim it, she can seldom do it without the walls of the convent, and if she does, the priests lay the crime on some luckless laic, that the holy culprit may come off with impunity.

DESPERATE ACT OF EUTHIRA.

In ancient and modern history, we are frequently presented with accounts of women, who, preferring death to slavery or prostitution, sacrificed their lives with the most undaunted courage to avoid them. Apollodorus tells us, that Hercules having taken the city of Troy, prior to the famous siege of it celebrated by Homer, carried away captive the daughters of Laomedon then king. One of these, named Euthira, being left with several other Trojan captives on board the Grecian fleet, while the sailors went on shore to take in fresh provisions, had the resolution to propose, and the power to persuade her companions, to set the ships on fire, and to perish themselves amid the devouring flames. The women of Phoenicia met together before an engagement which was to

decide the fate of their city, and having agreed to bury themselves in the flames, if their husbands and relations were defeated, in the enthusiasm of their courage and resolution, they crowned her with flowers who first made the proposal. Many instances occur in the history of the Romans of the Gauls and Germans, and of other nations in subsequent periods; where women being driven to despair by their enemies, have bravely defended their walls, or waded through fields of blood to assist their countrymen, and free themselves from slavery or from ravishment. Such heroic efforts are beauties, even in the character of the softer sex, when they proceed from necessity: when from choice, they are blemishes of the most unnatural kind, indicating a heart of cruelty, lodged in a form which has the appearance of gentleness and peace.

It has been alleged by some of the writers on human nature, that to the fair sex the loss of beauty is more alarming and insupportable than the loss of life; but even this loss, however opposite to the feelings of their nature, they have voluntarily consented to sustain, that they might not be the objects of temptation to the lawless ravisher. The nuns of a convent in France, fearing they should be violated by a ruffian army, which had taken by storm the town in which their convent was situated, at the recommendation of their abbess, mutually agreed to cut off all their noses, that they might save their chastity by becoming objects of disgust instead of desire. Were we to descend to particulars, we could give innumerable instances of women, who from Semiramis down to the present time, have distinguished themselves by their courage. Such was Penthesilea, who, if we may credit ancient story, led her army of viragoes to the assistance of Priam, king of Troy; Thomyris, who encountered Cyrus, king of Persia; and Thalestris, famous for her fighting, as well as for her amours with Alexander the Great. Such was the brave but ill-fated Boadicea, queen of the Britons, who led on that people to revenge the wrongs done to herself and her country by the Romans. And in later periods, such were the Maid of Orleans, and Margaret of Anjou; which last, according to several historians, commanded at no less than twelve pitched battles. But we do not choose to multiply instances of this nature, as we have already said enough to shew, that the sex are not destitute of courage when that virtue becomes necessary; and were they possessed of it, when unnecessary, it would divest them of one of the principal qualities for which we love, and for which we value them. No woman was ever held up as a pattern to her sex, because she was intrepid and brave; no woman ever conciliated the affections of the men, by rivalling them in what they reckon the peculiar excellencies of their own character.

LUXURIOUS DRESS OF THE GRECIAN LADIES.

As the Greeks emerged from the barbarity of the heroic ages, among other articles of culture, they began to bestow more attention on the convenience and elegance of dress. At Athens, the ladies commonly employ the whole morning in dressing themselves in a decent and becoming manner; their toilet consisted in paints and washes, of such a nature as to cleanse and beautify the skin, and they took great care to clean their teeth, an article too much neglected: some also blackened their eyebrows, and, if necessary, supplied the deficiency of the vermillion on their lips, by a paint said to have been exceedingly beautiful. At this time the women in the Greek islands make much use of a paint which they call Sulama, which imparts a beautiful redness to the cheeks, and gives the skin a remarkable gloss. Possibly this may be the same with that made use of in the times we are considering; but however this be, some of the Greek ladies at present gild their faces all over on the day of their marriage, and consider this coating as an irresistible charm; and in the island of Scios, their dress does not a little resemble that of ancient Sparta, for they go with their bosoms uncovered, and with gowns which only reach to the calf of their leg, in order to show their fine garters, which are commonly red ribbons curiously embroidered. But to return to ancient Greece; the ladies spent likewise a part of their time in composing head-dresses, and though we have reason to suppose that they were not then so preposterously fantastic as those presently composed by a Parisian milliner, yet they were probably objects of no small industry and attention, especially as we find that they then dyed their hair, perfumed it with the most costly essences, and by the means of hot irons disposed of it in curls, as fancy or fashion directed. Their clothes were made of stuffs so extremely light and fine as to show their shapes without offending against the rules of decency. At Sparta, the case was widely different; we shall not describe the dress of the women; it is sufficient to say that it has been loudly complained of by almost every ancient author who has treated on the subject.

GRECIAN COURTSHIP.

In the earlier periods of the history of the Greeks, their love, if we may call it so, was only the animal appetite, impetuous and unrestrained either by cultivation of manners, or precepts of morality; and almost every opportunity which fell in their way, prompted them to satisfy that appetite by force, and to revenge the obstruction of it by murder. When they became a more civilized people, they shone much more illustriously in arts and in arms, than in delicacy of sentiment and elegance of manners: hence we shall find, that their method of making love was more directed to compel the fair sex to a compliance with their wishes by charms and philtres, than to win them by the nameless assiduities and good offices of a lover.

As the two sexes in Greece had but little communication with each other, and a lover was seldom favored with an opportunity of telling his passion to his mistress, he used to discover it by inscribing her name on the walls of his house, on the bark of the trees of a public walk, or leaves of his books; it was customary for him also to deck the door of the house where his fair one lived, with garlands and flowers, to make libations of wine before it, and to sprinkle the entrance with the same liquor, in the manner that was practised at the temple of Cupid. Garlands were of great use among the Greeks in love affairs; when a man untied his garland, it was a declaration of his having been subdued by that passion; and when a woman composed a garland, it was a tacit confession of the same thing: and though we are not informed of it, we may presume that both sexes had methods of discovering by these garlands, not only that they were in love, but the object also upon whom it was directed.

Such were the common methods of discovering the passion of love; the methods of prosecuting it were still more extraordinary, and less reconcilable to civilization and to good principles; when a love affair did not prosper in the hands of a Grecian, he did not endeavor to become more engaging in his manners and person, he did not lavish his fortune in presents, or become more obliging and assiduous in his addresses, but immediately had recourse to incantations and philtres; in composing and dispensing of which, the women of Thessaly were reckoned the most famous, and drove a traffic in them of no considerable advantage. These potions were given by the women to the men, as well as by the men to the women, and were generally so violent in their operations as for some time to deprive the person who took them, of sense, and not uncommonly of life: their composition was a variety of herbs of the most strong and virulent nature, which we shall not mention; but herbs were not the only things they relied on for their purpose; they called in the productions of the animal and mineral kingdoms to their assistance; when these failed, they roasted an image of wax before the fire, representing the object of their love, and as this became warm, they flattered themselves that the person represented by it would be proportionally warmed with love. When a lover could obtain any thing belonging to his mistress, he imagined it of singular advantage, and deposited in the earth beneath the threshold of her door. Besides these, they had a variety of other methods equally ridiculous and unavailing, and of which it would be trifling to give a minute detail; we shall, therefore, just take notice as we go along, that such of either sex as believed themselves forced into love by the power of philtres and charms, commonly had recourse to the same methods to disengage themselves, and break the power of these enchantments, which they supposed operated involuntarily on their inclinations; and thus the old women of Greece, like the lawyers of modern times, were employed to defeat the schemes and operations of each other, and like them too, it is presumable, laughed in their sleeves, while they hugged the gains that arose from vulgar credulity.

POWER OF PHILTRES AND CHARMS.

The Romans, who borrowed most of their customs from the Greeks, also followed them in that of endeavoring to conciliate love by the power of philtres and charms; a fact of which we have not the least room to doubt, as they are in Virgil and some other of the Latin poets so many instances that prove it. But it depends not altogether on the testimony of the poets: Plutarch tells us, that Lucullus, a Roman General, lost his senses by a love potion; and Caius Caligula, according to Suetonius, was thrown into a fit of madness by one which was given him by his wife Caesonia; Lucretius too, according to some authors, fell a sacrifice to the same folly. The Romans, like the Greeks, made use of these methods mostly in their affairs of gallantry and unlawful love; but in what manner they addressed themselves to a lady they intended to marry, has not been handed down to us, and the reason we suppose is, that little or no courtship was practised among them; women had no disposing power of themselves, to what purpose was it then to apply to them for their consent? They were under perpetual guardianship, and the guardian having sole power of disposing of them, it was only necessary to apply to him. In the Roman authors, we frequently read of a father, a brother, or a guardian, giving his daughter, his sister, or his ward, in marriage; but we do not recollect one single instance of being told that the intended bridegroom applied to the lady for her consent; a circumstance the more extraordinary, as women in the decline of the Roman empire had arisen to a dignity, and even to a freedom hardly equalled in modern times.

EASTERN COURTSHIP.

It has long been a common observation among mankind, that love is the most fruitful source of invention; and that in this case the imagination of a woman is still more fruitful of invention and expedient than that of a man; agreeably to this, we are told, that the women of the island of Amboyna, being closely watched on all occasions, and destitute of the art of writing, by which, in other places, the sentiments are conveyed to any distance, have methods of making known their inclinations to their lovers, and of fixing assignations with them, by means of nosegays, and plates of fruit so disposed, as to convey their sentiments in the most explicit manner: by these means their courtship is generally carried on, and by altering the disposition of symbols made use of, they contrive to signify their refusal, with the same explicitness as their approbation. In some of the neighboring islands, when a young

man has fixed his affection, like the Italians, he goes from time to time to her door, and plays upon some musical instrument; if she gives consent, she comes out to him, and they settle the affair of matrimony between them; if, after a certain number of these kind of visits, she does not appear, it is a denial; and the disappointed lover is obliged to desist.

We shall see afterward when we come to treat of the matrimonial compact, that, in some places, the ceremony of marriage consists in tying the garments of the young couple together, as an emblem of that union which ought to bind their affections and interests. This ceremony has afforded a hint for lovers to explain their passion to their mistresses, in the most intelligible manner, without the help of speech, or the possibility of offending the nicest delicacy. A lover in these parts, who is too modest to declare himself, seizes the first opportunity he can find, of sitting down by his mistress, and tying his garment to hers, in the manner that is practised in the ceremony of marriage: if she permits him to finish the knot, without any interruption, and does not soon after cut or loose it, she thereby gives her consent; if she looses it, he may tie it again on some other occasion, when she may prove more propitious; but if she cuts it, his hopes are blasted forever.

LONG HAIR OF SAXONS AND DANES.

The human hair has ever been regarded as an ornament. The Anglo-Saxons and Danes considered their hair as one of their greatest personal beauties, and took great care to dress it to the utmost advantage. Young ladies wore it loose, and flowing in ringlets over their shoulders; but after marriage they cut it shorter, tied it up, and covered it with a head-dress, according to the fashion of the times; but to have the hair cut entirely off, was a disgrace of such a nature, that it was even thought a punishment not inadequate to the crime of adultery; so great, in the Middle ages, was the value set upon the hair by both sexes, that, as a piece of the most peculiar mortification, it was ordered by the canons of the church, that the clergy should keep their hair short, and shave the crown of their head; and that they should not, upon any pretence whatever, endeavor to keep the part so shaved from public view. Many of the clergy of these times, finding themselves so peculiarly mortified, and perhaps so easily distinguished from all other people by this particularity, as to be readily detected when they committed any of the follies or crimes to which human nature is in every situation sometimes liable, endeavored to persuade mankind that long hair was criminal, in order to reduce the whole to a similarity with themselves. Amongst these, St. Wulstan eminently distinguished himself. "He rebuked," says William of Malmsbury, "the wicked of all ranks with great boldness, but was _peculiarly_ severe upon those who were proud of their long hair. When any of these vain people bowed their heads before him, to receive his blessing, before he gave it he cut a lock from their hair, with a sharp penknife, which he carried about him for that purpose; and commanded them, by way of penance for their sins, to cut all the rest in the same manner: if any of them refused to comply with his command he reproached them for their effeminacy, and denounced the most dreadful judgments against them. Such, however, was the value of their hair in these days, that many rather submitted to his censures than part with it; and such was the folly of the church, and of this saint in particular, that the most solemn judgments were denounced against multitudes, for no other crime than not making use of pen-knives and scissors, to cut off an ornament bestowed by nature."

ST. VALENTINE'S DAY.

On St. Valentine's day, it is customary, in many parts of Italy, for an unmarried lady to choose, from among the young gentlemen of her acquaintance, one to be her guardian or gallant; who, in return for the honor of this appointment, presents to her some nosegays, or other trifles, and thereby obliges himself to attend her in the most obsequious manner in all her parties of pleasure, and to all her public amusements, for the space of one year, when he may retire, and the lady may choose another in his place. But in the course of this connection it frequently happens, that they contract such an inclination to each other, as prompts them to be coupled for life. In the times of the chivalry, we have seen that the men gloried in protecting the women, and the women thought themselves safe and happy when they obtained that protection. It is probable, therefore, that this custom, though now more an affair of gallantry than of protection, is a relic of chivalry still subsisting among that romantic and sentimental people.

But the observation of some peculiar customs on St. Valentine's day is not confined to Italy; almost all Europe has joined in distinguishing it by some particular ceremony. As it always happens about that time of the year, when the genial influences of the spring begin to operate, it has been believed by the vulgar, that upon it the birds invariably choose their mates for the ensuing season. In imitation, therefore, of their example, the vulgar of both sexes, in many parts of Britain, meet together; and having upon slips of paper wrote down the names of all their acquaintances, and put them into two different bags, the men drew the female names by lot, and the women the male; the man makes the woman who drew his name some trifling present, and in the rural gambol becomes her partner; and she considers him as her sweetheart, till he is otherwise disposed of, or till next Valentine's day provide her with another.

COURTS OF LOVE.

In Spain, during the Middle Ages, courts of Love were established. These courts were composed of ladies summoned to meet together, for the purpose of discussing, in the most formal and serious manner, "beautiful and subtle questions of love." They decided the precise amount of inconstancy which a lady might forgive, without lowering her own dignity, provided her lover made certain supplications, and performed certain penances; they took it into solemn consideration whether a lover was justified, under any circumstances, in expressing the slightest doubt of his lady's fidelity; they laid down definite rules, and ceremonials of behavior, to be observed by those who wished to be beloved; and gravely discussed the question whether sentiment, or sight, the heart, or the eyes, contributed most powerfully to inspire affection.

IMMODESTY AT BABYLON.

That modesty and chastity, which we now esteem as the chief ornament of the female character, does not appear in times of remote antiquity to have been much regarded by either sex. At Babylon, the capital of the Assyrian empire, it was so little valued, that a law of the country even obliged every woman once in her life to depart from it. This abominable law, which, it is said, was promulgated by an oracle, ordained, That every woman should once in her life repair to the temple of Venus; that on her arrival there, her head should be crowned with flowers, and in that attire, she should wait till some stranger performed with her the rites sacred to the goddess of debauchery.

This temple was constructed with a great many winding galleries appropriated to the reception of the women, and the strangers who, allured by debauchery, never failed to assemble there in great numbers, being allowed to choose any woman they thought proper from among those who came there in obedience to the law. When the stranger accosted the object of his choice, he was obliged to present her with some pieces of money, nor was she at liberty to refuse either these, or the request of the stranger who offered them, whatever was the value of the money, or however mean or disagreeable the donor. These preliminaries being settled, they retired together to fulfil the law, after which the woman returned and offered the goddess the sacrifice prescribed by custom, and then was at liberty to return home. Nor was this custom entirely confined to the Babylonians; in the island of Cyprus they sent young women at stated times to the sea-shore, where they prostituted themselves to Venus, that they might be chaste the rest of their lives. In some other countries, a certain number only were doomed to prostitution, as it is supposed, by way of a bribe, to induce the goddess of debauchery to save the rest.

When a woman had once entered the temple of Venus, she was not allowed to depart from it till she had fulfilled the law: and it frequently happened that those to whom nature had been less indulgent than to others, remained there a long time before any person offered to perform with them the condition of their release. A custom, we think, some times alluded to in scripture, and expressly delineated in the book of Baruch: "The women also, with cords about them, sitting in the ways, burn bran for perfume; but, if any of them, drawn by some that passeth by, lie with him, she reproacheth her fellow that she was not thought worthy as herself, nor her cord broken." Though this infamous law was at first strictly observed by all the women of Babylon, yet it would seem that, in length of time, they grew ashamed of, and in many cases dispensed with it; for we are informed that women of the superior ranks of life, who were not willing literally to fulfil the law, were allowed a kind of evasion; they were carried in litters to the gates of the temple, where, having dismissed all their attendants, they entered alone, presented themselves before the statue of the goddess, and returned home. Possibly this was done by the assistance of a bribe, to those who had the care of the temple.

INDECENCY AT ADRIANOPLE.

In Adrianople and the neighboring cities, the women have public baths, which are a part of their religion and of their amusement, and a bride, the first time she appears there, after her marriage, is received in a particular manner. The matrons and widows being seated round the room, the virgins immediately put themselves into the original state of Eve. The bride comes to the door richly dressed and adorned with jewels; two of the virgins meet her, and soon put her into the same condition with themselves; then filling some silver pots with perfume, they make a procession round the rooms, singing an epithalamium, in which all the virgins join in chorus; the procession ended, the bride is led up to every matron, who bestows on her some trifling presents, and to each she returns thanks, till she has been led round the whole. We could add many more ceremonies arising from marriage, but as they are for the most part such as make a part of the marriage ceremony itself, we shall have occasion to mention them with more propriety under another head.

ANCIENT SWEDISH COURTSHIP.

Grymer, a youth early distinguished in arms, who well knew how to dye his sword in the blood of his enemies, to run over the craggy mountains, to wrestle, to play at chess, trace the motions of the stars, and throw far from him heavy weights, frequently shewed his skill in the chamber of the damsels, before the king's lovely daughter; desirous of acquiring her regard, he displayed his dexterity in handling his weapons, and the knowledge he had attained in the sciences he had learned; at length ventured to make this demand: "Wilt thou, O fair princess, if I may obtain the king's consent, accept of me for a husband?" To which she prudently replied, "I must not make that choice myself, but go thou and offer the same proposal to my father."

The sequel of the story informs us, that Grymer accordingly made his proposal to the king, who answered him in a rage, that though he had learned indeed to handle his arms, yet as he had never gained a single victory, nor given a banquet to the beasts of the field, he had no pretensions to his daughter, and concluded by pointing out to him, in a neighboring kingdom, a hero renowned in arms, whom, if he could conquer, the princess should be given him: that on waiting on the princess to tell her what had passed, she was greatly agitated, and felt in the most sensible manner for the safety of her lover, whom she was afraid her father had devoted to death for his presumption, that she provided him with a suit of impenetrable armor and a trusty sword, with which he went, and having slain his adversary, and the most part of his warriors, returned victorious, and received her as the reward of his valor. Singular as this method of obtaining a fair lady by a price paid in blood may appear, it was not peculiar to the northerns: we have already taken notice of the price which David paid for the daughter of Saul, and shall add, that among the Sacae, a people of ancient Scythia, a custom something of this kind, but still more extraordinary, obtained: every young man who made his addresses to a lady, was obliged to engage her in single combat; if he vanquished, he led her off in triumph, and became her husband and sovereign; if he was conquered, she led him off in the same manner, and made him her husband and her slave.

LAPLAND AND GREENLAND LADY.

The delicacy of a Lapland lady, which is not in the least hurt by being drunk as often as she can procure liquor, would be wounded in the most sensible manner, should she deign at first to listen to the declaration of a lover; he is therefore obliged to employ a match-maker to speak for him; and this match-maker must never go empty handed; and of all other presents, that which must infallibly secures him a favorable reception is brandy. Having, by the eloquence of this, gained leave to bring the lover along with him, and being, together with the lover's father or other nearest-male relation, arrived at the house where the lady resides, the father and match-maker are invited to walk in, but the lover must wait patiently at the door till further solicited. The parties, in the mean time, open their suit to the other ladies of the family, not forgetting to employ in their favor their irresistible advocate brandy, a liberal distribution of which is reckoned the strongest proof of the lover's affection. When they have all been warmed by the lover's bounty, he is brought into the house, pays his compliments to the family, and is desired to partake of their cheer, though at this interview seldom indulged with a sight of his mistress; but if he is, he salutes her, and offers her presents of reindeer skins, tongues, &c.; all which, while surrounded with her friends, she pretends to refuse; but at the same time giving her lover a signal to go out, she soon steals after him, and is no more that modest creature she affected to appear in company. The lover now solicits for the completion of his wishes; if she is silent, it is construed into consent; but if she throws his presents on the ground with disdain the match is broken off forever.

It is generally observed, that women enter into matrimony with more willingness, and less anxious care and solicitude, than men, for which many reasons naturally suggest themselves to the intelligent reader. The women of Greenland are however, in many cases, an exception to this general rule. A Greenlander, having fixed his affection, acquaints his parents with it; they acquaint the parents of the girl; upon which two female negociators are sent to her, who, lest they should shock her delicacy, do not enter directly on the subject of their embassy, but launch out in praises of the lover they mean to recommend, of his house, of his furniture, and whatever else belongs to him, but dwell most particularly on his dexterity in catching seals. She, pretending to be affronted, runs away, tearing the ringlets of her hair as she retires; after which the two females, having obtained a tacit consent from her parents, search for her, and on discovering her lurking place, drag her by force to the house of her lover, and there leave her. For some days she sits with dishevelled hair, silent and dejected, refusing every kind of sustenance, and at last, if kind entreaties cannot prevail upon her, is compelled by force, and even by blows, to complete the marriage with her husband. It sometimes happens, that when the female match-makers arrive to propose a lover to a Greenland young woman, she either faints, or escapes to the uninhabited mountains, where she remains till she is discovered and carried back by her relations, or is forced to return by hunger and cold; in both which cases, she previously cuts off her hair; a most infallible indication, that she is determined never to marry.

EDUCATION OF WOMEN IN ASIA AND AFRICA.

In several of the warmer regions of Asia and Africa, the little education bestowed upon women, is entirely calculated to debauch their minds and give additional charms to their persons. They are taught vocal and instrumental music, which they accompany with dances, in which every movement and every gesture is expressively indecent: but receive no moral instruction; for it would teach them that they were doing wrong. This, however, is not the practice in all parts of Asia and Africa: the women of Hindostan are educated more decently; they are not allowed to learn music or dancing; which are only reckoned accomplishments fit for those of a lower order; they are notwithstanding, taught all the personal graces; and particular care is taken to instruct them in the art of conversing with elegance and vivacity; some of them are also taught to write, and the generality to read, so that they may be able to read the Koran; instead of which they more frequently dedicate themselves to tales and romances; which, painted in all the lively imagery of the East, seldom fail to corrupt the minds of creatures shut up from the world, and consequently forming to themselves extravagant and romantic notions of all that is transacted in it.

In well regulated families, women are taught by heart some prayers in Arabic, which at certain hours they assemble in a hall to repeat; never being allowed the liberty of going to the public mosque. They are enjoined always to wash themselves before praying; and, indeed, the virtues of cleanliness, of chastity, and obedience, are so strongly and constantly inculcated on their minds, that in spite of their general debauchery of manners, there are not a few among them, who, in their common deportment, do credit to the instructions bestowed upon them; nor is this much to be wondered at, when we consider the tempting recompense that is held out to them; they are, in paradise, to flourish forever, in the vigor of youth and beauty; and however old, or ugly, when they depart this life, are there to be immediately transformed into all that is fair, and all that is graceful.

RELIGIOUS FESTIVALS OF THE GREEKS.

A cause, which contributed to make the religious festivals of the Greeks appear as amusements and diversions, was that ridiculous buffoonery that constituted so great a part of them: it would be tedious to enumerate one half of these buffooneries; but let a few serve as a specimen. At a festival held in honor of Bacchus, the women ran about for a long time seeking the god, who, they pretended, had run away from them: this done, they passed their time in proposing riddles and questions to each other, and laughing at such as could not answer them; and at last often closed the scene with such enormous excesses, that at one of these festivals, the daughters of Minya, having, in their madness, killed Hippasus, had him dressed and served up to table as a rarity. At another, kept in honor of Venus and Adonis, they beat their breasts, tore their hair, and mimicked all the signs of the most extravagant grief, with which they supposed the goddess to have been affected on the death of her favorite paramour. At another, in honor of the nymph Cotys, they addressed her as the goddess of wantonness with many mysterious rites and ceremonies. At Corinth, these rites and ceremonies, being perhaps thought inconsistent with the character of modest women, this festival was only celebrated by harlots. Athenaeus mentions a festival, at which the women laid hold on all the old bachelors they could find, and dragged them round an altar; beating them all the time with their fists, as punishment for their neglect of the sex. We shall only mention two more; at one of which, after the assembly had met in the temple of Ceres, the women shut out all the men and dogs, themselves and the bitches remaining in the temple all night; in the morning, the men were let in, and the time was spent in laughing together at the frolic. At the other, in honor of Bacchus, they counterfeited phrenzy and madness; and to make this madness appear the more real, they used to eat the raw and bloody entrails of goats newly slaughtered. And, indeed, the whole of the festivals of Bacchus, a deity much worshipped in Greece, were celebrated with rites either ridiculous, obscene, or madly extravagant. There were others, however, in honor of the other gods and goddesses, which were more decent, and had more the appearance of religious solemnity, though even in these, the women dressed out in all their finery; and, adorned with flowers and garlands, either formed splendid processions, or assisted in performing ceremonies, the general tendency of which was to amuse rather than instruct.

THE DEATHS OF LUCRETIA AND VIRGINIA.

The force of prejudice appears in nothing more strongly than in the encomiums which have been lavished upon Lucretia for laying violent hands upon herself, and Virginius for killing his own daughter. These actions seem to derive all their glory from the revolutions to which they gave rise, as the former occasioned the abolition of monarchy amongst the Romans, and the latter put an end to the arbitrary power of the decemviri. But if we lay aside our prepossessions for antiquity, and examine these actions without prejudice, we cannot but acknowledge, that they are rather the effects of human weakness and obstinacy than of resolution and magnanimity. Lucretia, for fear of worldly censure, chose rather to submit to the lewd desires of Tarquin, than have it thought that she had been stabbed in the embraces of a slave; which sufficiently proves that all her boasted virtue was founded upon vanity, and too high a value for the opinion of mankind. The younger Pliny, with great reason, prefers to this famed action that of a woman

of low birth, whose husband being seized with an incurable disorder, chose rather to perish with him than survive him. The action of Arria is likewise much more noble, whose husband Paetus, being condemned to death, plunged a dagger in her breast, and told him, with a dying voice, "Paetus, it is not painful." But the death of Lucretia gave rise to a revolution, and it therefore became illustrious; though, as St. Augustine justly observes, it is only an instance of the weakness of a woman, too solicitous about the opinion of the world.

Virginius, in killing his daughter, to preserve her from falling a victim to the lust of the decemvir Claudius, was guilty of the highest rashness; since he might certainly have gained the people, already irritated against the tyrant, without imbruing his hands in his own blood. This action may indeed be extenuated, as Virginius slew his daughter from a false principle of honor, and did it to preserve her from what both he and she thought worse than death; namely, to preserve her from violation; but though it may in some measure be excused, it should not certainly be praised or admired.

ON LOOKING AT THE PICTURE OF A BEAUTIFUL FEMALE.

What dazzling beauties strike my ravish'd eyes, And fill my soul with pleasure and surprise! What blooming sweetness smiles upon that face! How mild, yet how majestic every grace! In those bright eyes what more than mimic fire Benignly shines, and kindles gay desire! Yet chasten'd modesty, fair white-robed dame, Triumphant sits to check the rising flame. Sure nature made thee her peculiar care: Was ever form so exquisitely fair? Yes, once there was a form thus heavenly bright, But now 'tis veil'd in everlasting night; Each glory which that lovely face could boast, And every charm, in traceless dust is lost; An unregarded heap of ruin lies That form which lately drew ten thousand eyes. What once was courted, lov'd, adored, and prais'd, Now mingles with the dust from whence 'twas raised. No more soft dimpling smiles those cheeks adorn, Whose rosy tincture sham'd the rising morn; No more with sparkling radiance shine those eyes, Nor over those the sable arches rise; Nor from those ruby lips soft accents flow, Nor lilies on the snowy forehead blow; All, all are cropp'd by death's impartial hand, Charms could not bribe, nor beauty's power withstand; Not all that crowd of wondrous charms could save Their fair possessor from the dreary grave.

How frail is beauty, transient, false and vain! It flies with morn, and ne'er returns again. Death, cruel ravager, delights to prey Upon the young, the lovely and the gay. If death appear not, oft corroding pain, With pining sickness in her languid train, Blights youth's gay spring with some untimely blast, And lays the blooming field of beauty waste; But should these spare, still time creeps on apace, And plucks with wither'd hand each winning grace; The eyes, lips, cheeks, and bosom he disarms, No art from him can shield exterior charms.

But would you, fair ones, be esteem'd, approved, And with an everlasting ardor loved; Would you in wrinkled age, admirers find, In every female virtue dress the mind; Adorn the heart, and teach the soul to charm, And when the eyes no more the breast can warm, These ever-blooming beauties shall inspire Each gen'rous heart with friendship's sacred fire; These charms shall neither wither, fade, nor fly; Pain, sickness, time, and death, they dare defy. When the pale tyrant's hand shall seal your doom, And lock your ashes in the silent tomb, These beauties shall in double lustre rise, Shine round the soul, and waft it to the skies.

ART OF DETERMINING THE PRECISE FIGURE, THE DEGREE OF BEAUTY, THE HABITS, AND THE AGE, OF WOMEN,

NOTWITHSTANDING THE AIDS AND DISGUISES OF DRESS.

OF FIGURE.

External indications as to figure are required chiefly as to the limbs which are concealed by drapery. Such indications are afforded by the walk, to every careful observer.

In considering _the proportion of the limbs to the body_--if, even in a young woman, the walk, though otherwise good, be heavy, or the fall on each foot alternately be sudden, and rather upon the heel, the limbs though well formed, will be found to be slender, compared with the body.

This conformation accompanies any great proportional developement of the vital system; and it is frequently observable in the woman of the Saxon population of England, as in the counties of Norfolk, Suffolk, &c.

In women of this conformation, moreover, the slightest indisposition or debility is indicated by a slight vibration of the shoulders, and upper part of the chest, at every step, in walking.

In considering _the line or direction of the limbs_--if, viewed behind, the feet, at every step, are thrown out backward, and somewhat laterally, the knees are certainly much inclined inward.

If, viewed in front, the dress, at every step, is as it were, gathered toward the front, and then tossed more or less to the opposite side, the knees are certainly too much inclined.

In considering _the relative size of each portion of the limbs_--if, in the walk, there be a greater or less approach to the marching pace, the hip is large; for we naturally employ the joint which is surrounded with the most powerful muscles, and in any approach to the march, it is the hip-joint which is used, and the knee and ancle-joints which remain proportionally unemployed.

If, in the walk, the tripping pace be used, as in an approach to walking on tiptoes, the calf is large; for it is only by the power of its muscles that, under the weight of the whole body, the foot can be extended for this purpose.

If, in the walk, the foot be raised in a slovenly manner, and the heel be seen, at each step, to lift the bottom of the dress upward and backward, neither the hip nor the calf is well developed.

Even with regard to the parts of the figure which are more exposed to observation by the closer adaptation of dress, much deception occurs. It is, therefore, necessary to understand the arts employed for this purpose, at least by skilful women.

A person having a narrow face, wears a bonnet with wide front, exposing the lower part of the cheeks.--One having a broad face, wears a closer front; and, if the jaw be wide, it is in appearance diminished, by bringing the corners of the bonnet sloping to the point of the chin.

A person having a long neck has the neck of the bonnet descending, the neck of the dress rising, and filling more or less of the intermediate space. One having a short neck has the whole bonnet short and close in the perpendicular direction, and the neck of the dress neither high nor wide.

Persons with narrow shoulders have the shoulders or epaulets of the dress formed on the outer edge of the natural shoulder, very full, and both the bosom and back of the dress running in oblique folds, from the point of the shoulder to the middle of the bust.

Persons with waists too large, render them less before by a stomacher, or something equivalent, and behind by a corresponding form of the dress, making the top of the dress smooth across the shoulders, and drawing it in plaits to a narrow point at the bottom of the waist.

Those who have the bosom too small, enlarge it by the oblique folds of the dress being gathered above, and by other means.

Those who have the lower posterior part of the body too flat, elevate it by the top of the skirt being gathered behind, and by other less skilful adjustments, which though hid, are easily detected.

Those who have the lower part of the body too prominent anteriorly, render it less apparent by shortening the waist, by a corresponding projection behind, and by increasing the bosom above.

Those who have the haunches too narrow, take care not to have the bottom of the dress too wide.

Tall women have a wide skirt, or several flounces, or both of these: shorter women, a moderate one, but as long as can be conveniently worn, with the flounces, &c., as low as possible.

OF BEAUTY.

Additional indications as to beauty are required chiefly where the woman observed precedes the observer, and may, by her figure, naturally and reasonably excite his interest, while at the same time it would be rude to turn and look in her face on passing.

There can, therefore, be no impropriety in observing, that the conduct of those who may happen to meet the women thus preceding, will differ according to the sex of the person who meets her.--If the person meeting her be a man, and the lady observed be beautiful, he will not only look with an expression of pleasure at her countenance, but will afterward turn more or less completely to survey her from behind.--If the person meeting her be a woman, the case becomes more complex. If both be either ugly or beautiful, or if the person meeting her be beautiful and the lady observed be ugly, then it is probable, that the approaching person may pass by inattentively, casting merely an indifferent glance; if, on the contrary, the woman meeting her be ugly, and the lady observed be beautiful, then the former will examine the latter with the severest scrutiny, and if she sees features and shape without

defect, she will instantly fix her eyes on the head-dress or gown, in order to find some object for censure of the beautiful woman, and for consolation in her own ugliness.

Thus he who happens to follow a female may be aided in determining whether it is worth his while to glance at her face in passing, or to devise other means of seeing it.

Even when the face is seen, as in meeting in the streets or elsewhere, infinite deception occurs as to the degree of beauty. This operates so powerfully, that a correct estimate of beauty is perhaps never formed at first. This depends on the forms and still more on the colors of dress in relation to the face. For this reason, it is necessary to understand the principles according to which colors are employed at least by skilful women.

When it is the fault of a face to contain too much yellow, then yellow around the face is used to remove it by contrast, and to cause the red and blue to predominate.

When it is the fault of a face to contain too much red, then red around the face is used to remove by contrast, and to cause the yellow and blue to predominate.

When it is the fault of a face to contain too much blue, then blue around the face is used to remove it by contrast, and to cause the yellow and red to predominate.

When it is the fault of a face to contain too much yellow and red, then orange is used.

When it is the fault of a face to contain too much red and blue, then purple is used.

When it is the fault of a face to contain too much blue and yellow, then green is used.

It is necessary to observe that the linings of bonnets reflect their color on the face, and transparent bonnets transmit that color, and equally tinge it. In both these cases, the color employed is no longer that which is placed around the face, and which acts on it by contrast, but the opposite. As green around the face heightens a faint red in the cheeks by contrast, so the pink lining of the bonnet aids it by reflection.

Hence linings which reflect, are generally of the teint which is wanted in the face; and care is then taken that these linings do not come into the direct view of the observer, and operate prejudicially on the face by contrast, overpowering the little color which by reflection they should heighten. The fronts of bonnets so lined, therefore, do not widen greatly forward, and bring their color into contrast.

When bonnets do widen, the proper contrast is used as a lining; but then it has not a surface much adapted for reflection, otherwise it may perform that office, and injure the complexion.

Understanding, then, the application of these colors in a general way, it may be noticed, that fair faces are by contrast best acted on by light colors, and dark faces by darker colors.

Dark faces are best affected by darker colors, evidently because they tend to render the complexion fairer; and fair faces do not require dark colors, because the opposition would be too strong.

Objects which constitute a background to the face, or which, on the contrary, reflect their hues upon it, always either improve or injure the complexion. For this and some other reasons, many persons look better at home in their apartments than in the streets. Apartments may, indeed, be peculiarly calculated to improve individual complexions.

OF MIND.

External indications as to mind may be derived from figure, from gait, and from dress.

As to figure, a certain symmetry or disproportion of parts (either of which depends immediately upon the locomotive system)--or a certain softness or hardness of form (which belongs exclusively to the vital system)--these reciprocally denote a locomotive symmetry or disproportion--or a vital softness or hardness--or a mental delicacy or coarseness, which will be found also indicated by the features of the face.

These qualities are marked in pairs, as each belonging to its respective system; for, without this, there can be no accurate or useful observation.

As to gait, that progression which advances, unmodified by any lateral movement of the body, or any perpendicular rising of the head, and which belongs exclusively to the locomotive system--or that soft lateral rolling of the body, which belongs exclusively to the vital system--or that perpendicular rising or falling of the head at every impulse to step, which belongs exclusively to the mental system--these reciprocally indicate a corresponding locomotive, or vital, or mental character, which will be found also indicated by the features of the face.

To put to the test the utility of these elements of observation and indication, let us take a few instances.--If, in any individual, locomotive symmetry of figure is combined with direct and linear gait, a character of mind and countenance not absolutely repulsive, but cold and insipid, is indicated. If vital softness of figure is combined, with a gentle lateral rolling of the body in its gait, voluptuous character and expression of countenance are indicated.--If delicacy of outline in the figure, be combined with perpendicular rising of the head, levity, perhaps vanity, is indicated.--But there are innumerable combinations and modifications of the elements which we have just described. Expressions of pride, determination, obstinacy, &c., are all observable.

The gait, however, is often formed, in a great measure, by local or other circumstances, by which it is necessary that the observer should avoid being misled.

Dress, as affording indications, though less to be relied on than the preceding, is not without its value. The woman who possesses a cultivated taste, and a corresponding expression of countenance, will generally be tastefully dressed; and the vulgar woman, with features correspondingly rude, will easily be seen through the inappropriate mask in which her milliner or dressmaker may have invested her.

OF HABITS.

External indications as to the personal habits of women are both numerous and interesting.

The habit of child-bearing is indicated by a flatter breast, a broader back, and thicker cartilages of the bones of the pubis, necessarily widening the pelvis.

The same habit is also indicated by a high rise of the nape of the neck, so that the neck from that point bends considerably forward, and by an elevation which is diffused between the neck and shoulders. These all arise from temporary distensions of the trunk in women whose secretions are powerful, from the habit of throwing the shoulders backward during pregnancy, and the head again forward, to balance the abdominal weight; and they bestow a character of vitality peculiarly expressive.

The same habit is likewise indicated by an excess of that lateral rolling of the body in walking, which was already described as connected with voluptuous character. This is a very certain indication, as it arises from temporary distensions of the pelvis, which nothing else can occasion. As in consequence of this lateral rolling of the body, and of the weight of the body being much thrown forward in gestation, the toes are turned somewhat inward, they aid in the indication.

The habit of nursing children is indicated, both in mothers and nursery-maids, by the right shoulder being larger and more elevated than the left.

The habits of the seamstress are indicated by the neck suddenly bending forward, and the arms being, even in walking, considerably bent forward or folded more or less upward from the elbows.

Habits of labor are indicated by a considerable thickness of the shoulders below, where they form an angle with the inner part of the arm; and, where these habits are of the lowest menial kind, the elbows are turned outward, and the palms of the hands backward.

OF AGE.

External indications of age are required chiefly where the face is veiled, or where the woman observed precedes the observer and may reasonably excite his interest.

In either of these cases, if the foot and ankle have lost a certain moderate plumpness, and assumed a certain sinewy or bony appearance, the woman has generally passed the period of youth.

If in walking, instead of the ball or outer edge of the foot first striking the ground, it is the heel which does so, then has the woman in general passed the meridian of life. Unlike the last indication, this is apparent, however the foot and ankle may be clothed.--The reason of this indication is the decrease of power which unfits the muscles to receive the weight of the body by maintaining the extension of the ankle-joint.

Exceptions to this last indication are to be found chiefly in women in whom the developments of the body are proportionally much greater, either from a temporary or a permanent cause, than those of the limbs, the muscles of which are consequently incapable of receiving the weight of the body by maintaining the extension of the ankle-joint.

THE IDEAL OF FEMALE BEAUTY;

OR A DESCRIPTION OF THE FAMOUS STATUE OF THE VENUS DE MEDICI.

The Venus de Medici at Florence is the most perfect specimen of ancient sculpture remaining; and is spoken of as the Model of Female Beauty. It was so much a favorite of the Greeks and Romans, that a hundred ancient repetitions of this statue have been noticed by travellers. This statue is said to have been found in the forum of Octavia at Rome. It represents woman at that age when every beauty has just been perfected.

"The Venus de Medici at Florence," says a distinguished writer, "is like a rose which, after a beautiful daybreak, expands its leaves to the first ray of the sun, and represents that age when the limbs assume a more finished form and the breast begins to develop itself."

The size of the head is sufficiently small to leave that predominance to the vital organs in the chest, which, as already said, makes the nutritive system peculiarly that of woman. This is the first and most striking proof of the profound knowledge of the artist, the principles of whose art taught him that a vast head is not a constituent of female beauty. In mentioning the head it is scarcely possible to avoid noticing the rich curls of hair.

The eyes next fix our attention by their soft, sweet, and glad expression. This is produced with exquisite art. To give softness, the ridges of the eyebrows are rounded. To give sweetness, the under eyelid, which I would call the expressive one, is slightly raised. To give the expression of gladness or of pleasure, the opening of the eyelids is diminished, in order to diminish, or partially to exclude, the excess of those impressions, which make even pleasure painful. Other exquisite details about those eyes, confer on them unparallelled beauty. Still, this look is far from those traits indicative of lasciviousness, with which some modern artists have thought to characterize their Venuses.

Art still profounder was perhaps shown in the configuration of the nose. The peculiar connexion of this sense with love was evidently well understood by the artist. Not only is smell peculiarly associated with love, in all the higher animals, but it is associated with reproduction in plants, the majority of which evolve delicious odors only when the flowers or organs of fructification are displayed. Connected, indeed, with the capacity of the nose, and the cavities which open into it, is the projection of the whole middle part of the face.

The mouth is rendered sweet and delicate by the lips being undeveloped at their angles, and by the upper lip continuing so, for a considerable portion of its length. It expresses love of pleasure by the central development of both lips, and active love by the especial development of the lower lip. By the slight opening of the lips, it expresses desire.

These exquisite details, and the omission of nothing intellectually expressive that nature presents, have led some to imagine the Venus de Medici to be a portrait. In doing so, however, they see not the profound calculation for every feature thus embodied. More strangely still, they forget the ideal character of the whole: the notion of this ideal head being too small, is especially opposed to such an opinion.

Withal, the look is amorous and languishing, without being lascivious, and is as powerfully marked by gay coquetry, as by charming innocence.

The young neck is exquisitely formed. Its beautiful curves show a thousand capabilities of motion; and its admirably-calculated swell over the organ of voice, results from, and marks the struggling expression of still mysterious love.

With regard to the rest of the figure, the admirable form of the mammae, which, without being too large, occupy the bosom, rise from it with various curves on every side, and all terminate in their apices, leaving the inferior part in each precisely as pendent as

gravity demands; the flexile waist gently tapering little farther than the middle of the trunk; the lower portion of it beginning gradually to swell out higher even than the umbilicus; the gradual expansion of the haunches, those expressive characteristics of the female, indicating at once her fitness for the office of generation and that of parturition--expansions which increase till they reach their greatest extent at the superior part of the thighs; the fulness behind their upper part, and on each side of the lower part of the spine, commencing as high as the waist, and terminating in the still greater swell of the distinctly-separated hips; the flat expanse between these, and immediately over the fissure of the hips, relieved by a considerable dimple on each side, and caused by the elevation of all the surrounding parts; the fine swell of the broad abdomen which, soon reaching its greatest height immediately under the umbilicus, slopes neatly to the mons veneris, but, narrow at its upper part, expands more widely as it descends, while, throughout, it is laterally distinguished by a gentle depression from the more muscular parts on the sides of the pelvis; the beautiful elevation of the mons veneris; the contiguous elevation of the thighs which, almost at their commencement rise as high as it does; the admirable expansion of these bodies inward, or toward each other, by which they almost seem to intrude upon each other, and to exclude each from its respective place; the general narrowness of the upper, and the unembraceable expansion of the lower part thus exquisitely formed;--all these admirable characteristics of female form, the mere existence of which in woman must, one is tempted to imagine, be even to herself, a source of ineffable pleasure--these constitute a being worthy, as the personification of beauty, of occupying the temples of Greece; present an object finer, alas! than nature seems even capable of producing; and offer to all nations and ages a theme of admiration and delight.

Well might Thomson say:--

"So stands the statue that enchants the world, So bending tries to veil the matchless boast, The mingled beauties of exulting Greece."

And Byron, in yet higher strain:--

"There, too, the goddess loves in stone, and fills The air around with beauty; within the pale We stand, and in that form and face behold What Mind can make, when Nature's self would fail; And to the fond idolaters of old Envy the innate flash which such a soul could mould.

We gaze and turn away, and know not where, Dazzled and drunk with beauty, till the heart Reels with its fulness; there--forever there-- Chained to the chariot of triumphal Art, We stand as captives, and would not depart."

THE FIRST KISS OF LOVE.

BY LORD BYRON.

Away with those fictions of flimsy romance! Those tissues of falsehood which folly has wove! Give me the mild beam of the soul-breathing glance, Or the rapture which dwells on the first kiss of love.

Ye rhymers, whose bosoms with phantasy glow, Whose pastoral passions are made for the grove, From what blest inspiration your sonnets would flow, Could you ever have tasted the first kiss of love!

I hate you, ye cold compositions of art; Though prudes may condemn me, and bigots reprove, I court the effusions that spring from the heart Which throbs with delight to the first kiss of love.

Oh! cease to affirm that man, since his birth, From Adam till now, has with wretchedness strove; Some portion of paradise still is on earth, And Eden revives in the first kiss of love.

When age chills the blood, when our pleasures are past-- For years fleet away with the wings of the dove-- The dearest remembrance will still be the last, Our sweetest memorial the first kiss of love.

THE DEATH OF CLEOPATRA.

See Frontispiece.

The Princess of antiquity, most renowned for her personal charms, was in her unrivalled beauty, her mental perfections, her weaknesses, and the unhappy conclusion of an amorous existence the counterpart of the most beautiful queen of later times, the unfortunate Mary of Scotland.

Cleopatra was the daughter of Ptolemy Auletes, king of Egypt. She was early given to wife to her own brother, Ptolemy Dionysius, and ascended the throne conjointly with him, on the death of their father. It was doubtless the policy of the kingdom thus to preserve all the royal honors in one family--the daughter being the queen, as well as the son king of the country. But her ambitious and intriguing spirit, restrained by no ties of reciprocal love to her husband, who was also her brother, sought for means to burst a union at once unnatural and galling: and the opportunity at length arrived. Julius Caesar, the conqueror of the world, having pursued the defeated Pompey into Egypt, there beheld Cleopatra in the zenith of her beauty; and he before whose power the whole world was kneeling, prostrated himself before a pretty woman. The following is the account of her first introduction to Caesar, as given by the historian. It shows that she had no maidenly scruples as to the mode of attaining her ends.

Her intrigues to become sole monarch, had made her husband-brother banish her from the capital. Hearing of the arrival of Caesar, she got into a small boat, with only one male friend, and in the dusk of the evening made for the palace where Caesar as well as her husband lodged. As she saw it difficult to enter it undiscovered by her husband's friends, she rolled herself up in a carpet. Her companion tied her up at full length like a bale of goods, and carried her in at the gates to Caesar's apartments. This stratagem of hers, which was a strong proof of her wit and ingenuity, is said to have first opened her way to Caesar's heart, and her conquest advanced rapidly by the charms of her speech and person. The genius of Shakspeare has well depicted the power of her beauty at this time. He makes her to say, at a later period of life, when chagrined at the expected desertion of another lover,--

"Broad-fronted Caesar! When thou wast here above the ground, I was A morsel for a monarch: And great Pompey Would stand, and make his eyes grow in my brow; There would he fix his longing gaze, and die With looking on his life."

But Cleopatra, who was not less remarkable for her cunning than for her beauty, knowing that Caesar was resolved to be gratified at whatever cost, determined that the price should be a round one: the terms of his admission to her arms, were that Caesar should expel her brother from the kingdom, and give the crown to her; which Caesar complied with. Cleopatra had a son by Caesar called Caesarion.

In the civil wars which distracted the Roman empire after the death of Caesar, Cleopatra supported Brutus, against Antony and Octavius. Antony, in his expedition to Parthia, summoned her to appear before him. She arrayed herself in the most magnificent apparel, and appeared before her judge in the most captivating attire. Though somewhat older than when she drew Caesar to her arms, her charms were still conspicuous;

"Age could not wither her, nor custom stale Her infinite variety. Other women cloy The appetite they feed. But she made hungry Where most she satisfied."

Her artifice on this occasion succeeded; Antony became enamoured of her, and publicly married her, although his wife the sister of Octavius was living. He gave Cleopatra the greater part of the eastern provinces of the Roman empire. This behaviour was the cause of a rupture between Octavius and Antony; and these two celebrated generals met in battle at Actium, where Cleopatra, by flying with sixty sail of vessels, ruined the interest of Antony, and he was defeated. Cleopatra had retired to Egypt, where soon after Antony followed her. Antony stabbed himself upon the false information that Cleopatra was dead; and as his wound was not mortal, he was carried to the queen, who drew him up by a cord from one of the windows of the monument, where she had retired and concealed herself.

Antony soon after died of his wounds, and Cleopatra, after she had received pressing invitations from Octavius, and even pretended declarations of love, destroyed herself by the bite of an asp, not to fall into the conqueror's hands. She had previously attempted to stab herself, and had once made a resolution to starve herself. But the means by which she destroyed herself, is said to produce the easiest of deaths: the Asp is a small serpent found near the river Nile, so delicate that it may be concealed in a fig; and when presented to the vitals of the body, its bite is so deadly as to render medical skill useless, while at the same time it is so painless, that the victim fancies herself dropping into a sweet slumber, instead of the arms of death. So Cleopatra, while she is applying the venomous reptile to her bosom, (as represented in the Frontispiece,) is supposed to use language like the following,--

"Dost thou not see my baby at my breast, That sucks the nurse asleep?"

Thus, after having chained in her embrace the two greatest generals that the Roman empire had produced, Julius Caesar and Mark Antony, at the periods when they were respectively arbiters of the world's fate, perished Cleopatra by her own hand.

Cleopatra was a voluptuous and extravagant woman, and in one of the feasts she gave to Antony at Alexandria, she melted pearls into her drink to render the entertainment more sumptuous and expensive. She was fond of appearing dressed as a goddess; and

she advised Antony to make war against the richest nations, to support her debaucheries. Her beauty has been greatly commended, and her mental perfections so highly celebrated, that she has been described as capable of giving audience to the ambassadors of seven different nations, and of speaking their various languages as fluently as her own.

How vain are the possessions of beauty, power, personal and mental accomplishments, if to these are not united virtuous principles. All history, as well as all experience, is full of examples calculated to impress the great lesson that

"VIRTUE alone is HAPPINESS below."

AN ESSAY ON MATRIMONY.

Socrates, being asked, whether it were better for a man to marry, or to remain single, replied,--"Let him do either, he will repent of it."

The philosopher spoke 'like an oracle,' leaving the world as much in the dark as to his views of the comparative advantages of matrimony and celibacy, as they could have been before. But a vast majority of men have chosen, since they must repent of one or the other, to repent of marrying, deeming perhaps that this repentance is "_the repentance which needeth not to be repented of_."

We shall conclude our little treatise on "the sex," with a few remarks on the subject of--we were about to say--Happiness,--but as we are content that every married man and woman should judge for themselves as to the happiness of the married state, we will simply style it an ESSAY ON MATRIMONY.

No event is more important, and none is conducted, on many occasions, with less prudence, than Marriage. Providence has allowed the passions to exercise a powerful influence in this matter, otherwise the cares and anxieties with which it is attended would deter most persons from launching their bark of earthly happiness on the great ocean of matrimony. But too frequently the passions are the only guide, and these stimulate to bewilder: they exhibit pleasing and attractive imagery, and then the possession destroys the bliss.

Love is a pleasing but exciting passion. The eye is delighted by form, manners, and the expression of the features, the ears by musical language, and the imagination paints future joys; all of which contribute to one great principle, that of receiving happiness from those we love, and evincing love for those from whom we derive our happiness. As the crystal streams are absorbed by the sun, and distributed as brilliant clouds in the heavens, and then fall and run in their accustomed channels, and thus the rivers supply the clouds, and the vapors the rivers, so is the interchange between love and happiness. This will agree with the opinion that love may be occasioned suddenly, because enjoyment is expected; or it may arise gradually, because the unattractiveness which first existed, may be succeeded by attraction.

There was no appointment by nature of particular persons for each other; but we may expect among a great variety of occurrences to meet with some singular and astonishing coincidences. Human beings appear to be left in this respect, as in many others, to their own judgment. If they act discreetly, they enjoy the comfort of it; but if otherwise, they bring upon themselves a disadvantage.

The happiness arising from an union depends chiefly on the character of the persons who are concerned in it. If men and women were as consistent and virtuous as they should be, the connubial bond would be soft and pleasant; but as these effects do not always arise, where is the fault? Which is better, or more worthy, the male or the female sex? This is rather a difficult question; and let the palm of superior merit be awarded to either, the imputation of prejudice would be connected with the decision. But fortunately there is little difference: one varies from the other in particular qualities; but if the aggregate of merit be taken in each, the amount will not differ much. Education forms the principal variation: men are instructed in the more active and laborious employments, women in the more sedentary and domestic. Dr Southey says, that "if women are not formed of finer clay, there has been more of the dew of heaven to temper it." Richard Flecknoe, a contemporary with Dryden, observes of the female sex,--"I have always been conversant with the best and worthiest in all places where I came; and among the rest with ladies, in whose conversation, as in an academy of virtue, I learnt nothing but goodness, and saw nothing but nobleness." It must be granted, that women in general possess more of the sweetness and softness of human nature, while men are endowed with more vigorous virtues; women are gifted with more fortitude, and men with more valor.

Jeremy Taylor says,--"Marriage hath in it the labor of love, and the delicacies of friendship; the blessings of society, and the union of hands and hearts."

Cowper has also alluded to the advantages of a matrimonial settlement,--

"O friendly to the best pursuits of man, Friendly to thought, to virtue, and to peace, Domestic life in rural pleasure pass'd."

Marriage is frequently an union of interest: the happiness of one is made a source of enjoyment to the other. It is for life, because it is most agreeable with the inclination of mankind that friendship, esteem and love should be permanent. In this instance a continuance of the union constitutes no small part of the bliss. The expectation of a durable connection makes men careful, otherwise they would marry and unmarry every week. There is, by the arrangement of the Almighty, a comparative power or influence vested in the man, because, agreeably with all good government,--

"Some are, and must be, greater than the rest;"

but then, as Dr Beattie observes, "the superiority vested by law in the man is compensated to the woman by that superior complaisance which is paid them by every man who aspires to elegance of manners." And besides this, the husband has frequently the nominal, while the wife has the actual power:--

"Like as the helme doth rule the shippe,"

so she regulates all the household affairs. This is proper, when the husband allows it; and he ought to do so, when his wife is capable of managing these things; but when the inclinations of his Eve run perversely, when he is conscious that he has reason on his side, and she only folly, and yet he is vacillating and yielding, he is unmanly and inconsistent; he sacrifices future happiness to present peace. Every woman, it must be granted, is not a sensible one; and "there is nothing," as Lord Burleigh observed to his son, "more fulsome than a she foole." If Socrates had properly controlled his Xantippe before her disorder had increased beyond cure, it would have contributed to her happiness and his own. Prince Eugene observed, on one occasion, rather satirically, that love was a mere amusement, and calculated for nothing more than to enlarge the influence of the woman, and abridge the power of the man. Goldsmith's Hermit said to his lovely visiter,--

"And love is still an emptier sound, The modern fair one's jest; On earth unseen, or only found To warm the turtle's nest."

But love is an actual, a powerful, and a beneficial principle, if it be properly regulated. Among married persons there ought to be as much love as would induce either to yield in trifling matters; and there ought to be as much reason as would enable both to act correctly. Matrimony should be something like the union of the ivy and the oak: the latter is firm, and capable of supporting its more tender companion; the ivy, however, must follow in some measure the humors and windings of the oak; but they grow together, and the longer they continue the more closely they are united. There have been many instances of great attachment. Porcia, the wife of Brutus, when she heard of her husband's death swallowed burning coals that she might go with him. Alceste, wife of Admetus king of Thessaly, sacrificed herself for the safety of her husband. This monarch was ill; and when the oracle was consulted, it was declared that he would not recover except some friend would die for him; and as no one else would do so, the wife heroically drank a cup of poison. Paulina the wife of Seneca in his old age, was young, beautiful, and accomplished; and she was so much attached to her husband, that when the veins of Seneca were opened by the command of Nero, she caused her own to be cut, that she might also bleed to death. When Conrad III. had taken the town of Winsberg in Bavaria, he allowed only the women to go out; but they had leave to carry with them as much as they pleased. They loaded themselves, therefore, with their husbands and children, and brought them all out on their shoulders! When love is genuine; when professions are sincere, and the practice agreeable therewith; when health is enjoyed, and as many comforts as are necessary for this life; when children grow up in vigor, good behaviour, and mental improvement; when old age is solaced by the company of each other, and the kind attention of daughters and sons; then matrimony is a cause of happiness.

But if all these enjoyments were the lot of every married person, men would become too much contented with the present life, and they would scarcely think, as they sail on smoothly, of the haven, for which they are bound. Besides, the fascinations of domestic life would attract them from many duties which they owe to their fellow creatures. There are then many disadvantages connected with matrimony. There is so much ignorance, perverseness, undue inclination for power, disposition to contradict, anger, jealousy, hatred, and versatility among human beings that many unpleasant occurrences will necessarily arise, and especially in the marriage state, because here most of these feelings are brought into action, and are most sensibly felt by those who are subject to their influence. He that paints the experience of human life in brilliant colors only gives a flattering and deceptive representation,--he may just as well pretend that the heavens are always cloudless. People soon discover that there are sorrows in the world as well as joys, unpleasant as well as pleasant events; hence arises the advantage of examining, of pointing out, and endeavoring to avoid

"the ills which flesh is heir to." The perpetuity of marriage, under pleasing circumstances, is its most lovely character; but the same peculiarity, under a different aspect, is its principal source of misery. It is too frequently a state of bondage, "which thousands once fast-chained to quit no more." But what exists, and cannot be removed, should always be borne as patiently as possible; and thus we may keep a cheerful heart, when another, less prudent, would be gloomy. Besides, an ill temper makes every condition of life unhappy; a cheerful disposition will throw a gleam of sunshine over the scenery of a November day. Some people, very foolishly, make themselves uneasy because they are bound. Sir Jonah Barrington seems to think it a natural propensity. He says,--"The moment any two animals, however fond before, are fastened together by a chain they cannot break, they begin to quarrel without any apparent reason, and peck each other solely because they cannot get loose again." But it must be remembered that people enter into marriage with a knowledge of the permanency of the union, and perhaps they seldom repent, except they had been deceived; and this we may hope would not occur frequently. After the Romans had introduced a law of divorce, no respectable person, for the space of forty years, availed himself of it. Divorcement was much practised among the Jews, and was productive of great evil. One of the Jewish doctors asserted, that if a man beheld a woman who was handsomer than his wife, he might put away his wife and marry her; and thus all the wives in Judea, except the handsomest, might have been divorced. Josephus observes, on one occasion, very coolly,--"About this time I put away my wife, who had borne me three children, not being pleased with her manners."

One cause of unhappiness in a married state, is too little affection; and in other instances, although affection may be possessed, it is not shown. Montesquieu observes, "that women commonly reserve their love for their husbands until their husbands are dead." Sometimes a mortal hatred springs up, which induces a man, like Henry VIII., to cause the murder of those whom he has sworn to love and preserve; or a woman, like Livia, to poison her husband. Not only is a great dissimilarity of rank and condition a cause of dislike, but a great variation in age is frequently the cause of distrust and unhappiness. The proportion which Aristotle suggests (a man of thirty-seven to a woman of eighteen,) may be appropriate in one respect, but it is objectionable in others. The life of the female is just as long as that of the male; and the union of middle age and youth, where the one is twice as old as the other, will not always allow an uniformity of feelings and disposition. The case of Seneca (to which we have alluded,) and that of Sir Matthew Hale, are exceptions. Youth is generally gay, thoughtless, and frivolous; but life, in more advanced periods, is sober, thoughtful, and dignified. A husband should not be deemed a teacher or guardian for the wife so much as a companion; and the wife should not be considered as guardian for the husband: there ought to be a mutual sympathy, and in most respects an equality of influence.

Jealousy is a passion which allows the hapless possessor to enjoy neither rest nor confidence. It is frequently the companion of love. Shakspeare says,

"For where love reigns, disturbing jealousy Doth call himself affection's sentinel."

When this principle obtains possession of the breast, it destroys the health and spirits: the streams which gladden the heart become corrupted, and productive of rage and melancholy. Jealousy is like the snake which insidiously entwines itself around its victim; or like the bohun upas of Java, which diffuses death. The bright beams of hope, which cheered the possessor, and carried his vision to distant days and distant scenes of enjoyment, are all eclipsed by this pillar of darkness. Moliere the poet was endowed with an eminent genius--he was esteemed as the first wit in Europe; but his wife was faithless, and no enjoyment, or success, or honor could tranquillize his mind, and make him happy. The attractions of youth and beauty will sometimes excite an illicit passion, but the indulgence of this feeling is the path to anxiety and degradation. The female may be less faulty; but she will be the greater sufferer; for, with regard to her lawful companion, confidence is changed to timidity, love to hypocrisy, and a continual fear torments her, lest accident or malice should discover her imprudence. How dearly is the pleasure of a moment procured when it is purchased by years of unhappiness! On the other hand, it is extremely unreasonable for some persons to indulge as they do, their natural disposition of suspicion, and thus make others unhappy. Where virtue only exists, it is a most grievous hardship that the possessor should be subject to the penalty of vice. Nothing should be made with more caution than a decision in which the innocent may receive the odium which belongs to the guilty.

Sometimes the worst sort of accomplishments are brought by a lady into the marriage state: she may be capable of singing admirably, of dancing, of painting, of performing skilfully on the harp or piano, of making ingenious trinkets and ornaments; all this may be well enough for an unmarried lady, but of what use are they in a state of matrimony? It is true, that if she be favored with a handsome fortune, she may indulge herself agreeably with her inclination, and employ others to manage her household affairs; but not many are thus situated; and, even in this case, there are duties which belong to the wife, in regard to her husband and children, which would occupy pretty much of her time. It is still worse if she be fond of dissipation,--of routs, balls, and public amusements; if she fly abroad in pursuit of a phantom while domestic enjoyment is neglected. A good wife will endeavor to make herself happy at

home, and she will try to make all at home happy: she should endeavor to make the pathway of life cheerful by her smiles and attention, so that her husband may be delighted with his dwelling, and find it his happiest place; and that the children may be regulated with all necessary care.

A good temper is essential for matrimonial happiness. An habitually irritable or gloomy disposition is a source of misery to the possessor and to others. A dark and murky cave could as well throw out a cheerful lustre, as a surly person communicate happiness to those around him. Obstinacy must not be indulged by either party; for, as the bond of union cannot be easily broken, if one be perverse the other must bend. If two trees be bound tightly together, and both be stiff, the cords will probably break; if not immediately, they will when the cords become weaker: and thus with regard to matrimony, what God has joined together, the perversity of human beings will put asunder. Obstinacy in trifling matters in the marriage state is an evidence of little love and a bad heart; but if trifling matters appear important, and the gaining of every point be as the taking of a citadel, the person is wrong in his judgment; he is insane, or partially so. Many worthy women have been cursed with worthless husbands; but, unfortunately, the grievances of the female sex have been less frequently known than those of the men; for women are not authors, and men are frequently so; consequently, in all estimates of the comparative merit of the sexes, it must be remembered that more has been said on the one side than on the other. Home, however, is the castle of the wife, if she be a good one; here she keeps her permanent abode, agreeably with the injunction of St. Paul. The husband is absent the principal part of his time, may there not therefore, on some occasions, be too greet an inclination in the lady to consider herself as the governor of the establishment, while the husband may be deemed a visiter, rather than the master? This would not arise in the breast of an amiable and affectionate wife, but it has sometimes arisen; for, unfortunately, all wives have not been good ones. Jerome Cardan was so unfortunate as to have a wife who was proverbial for her ill temper and arbitrary conduct. John Knox said of Lord Erskine, "He has a very Jezebel to his wife." Salmasius, the opponent of Milton, was made perpetually uneasy by a similar thorn. The unfortunate husband was a Frenchman, and Milton said (as Dr Johnson observes,) "Tu es Gallus, et, ut aiunt, nimium gallinaceus." Milton himself seems to have suffered from a similar cause, for he evinces so much hostility to the female sex, that no other reason would so naturally account for it. He exclaims,

"O why did God, Creator wise, that peopled highest Heaven With spirits masculine, create at last This novelty on earth, this fair defect Of nature, and not fill the world at once With men and angels without feminine?"

Milton adds a great deal more, which, if he had a high opinion of woman, even his anxiety to make his character of Adam consistent would not have demanded. An amiable temper on the part of a wife, with her own natural softness, and an inclination to yield in unimportant matters, will not only increase love, but power; for in this respect, agreeably to the opinion of Prince Eugene, love is power.

Marriage is sometimes made a matter of mere convenience; people enter into it with as much indifference as they would into any other speculation, and when one companion dies they take another. In the book of Tobit we have an account of Sara, the daughter of Raguel, who had been favored with seven husbands, whom "Asmodeus the evil spirit had killed." Love must be exceedingly pliable, it must be love to man, and not to a man, that would suffer a woman to transfer her affections seven times. It would be a ludicrous occurrence, if, upon any particular occasion, a man's three or four wives, or a woman's three or four husbands, should "burst their cerements," and visit their former dwelling. What astonishment! What uplifted hands and distended eyeballs! What speechlessness and violent speeches,--reproaches and animosities! When the Duke of Rutland was Viceroy of Ireland, Sir John Hamilton attended one of his Grace's levees. "This is timely rain," said the Duke, "it will bring every thing above ground."--"I hope not, my Lord," replied Sir John, "for I have three wives there." Marriage may be well extended to two wives and two husbands in succession; this, in some cases, is necessary; but when it goes to three or four it is objectionable. The man who moves from place, sometimes living here and sometimes there, will never gain a pure and ardent love of home; by the same rule, a succession of wives will only induce an habitual or mechanical regard to the wife for the time being; in the same way as loyalty may be transferred from one sovereign to another. Besides, a family with different degrees of relationship and with different interests is formed, and this contributes nothing towards domestic tranquillity. There may be some particular cases in which the evils to which we have alluded may not arise; these may be deemed exceptions.

There are some sorrows peculiar to matrimony; and some which, though they fall on other conditions of life, are felt more heavily when they intrude themselves within the boundary of connubial love. Poverty and sickness are more grievous evils under circumstances of this sort; because a man feels not only for himself, but for others. How dreadful must it be when the husband beholds his wife in squalid misery. What are the feelings of a mother when she sees her innocent children suffering from hunger! And when the iron hand of affliction presses upon the brow of a husband or a wife, and the sharp arrows of pain occasion groans, is

there not an almost equal anguish is the breast of an affectionate partner? And when the heavy clouds of sorrow gather around at the anticipated separation of those who had lived in the bonds of harmony--when the chilly arms of death are held out to clasp him, or her, who had been used to a more tender embrace, how dreadful is that period! Is not the woe of separating generally in the same proportion as the bliss of uniting? And is it not a valuable loan to be paid by a mighty sacrifice?

Unhappiness may be occasioned by indulging an undue degree of love. Sentimental bliss is generally followed by sentimental sorrow; consequently, people may love one another too ardently, so as to make the thought of parting a source of misery. If two plants grow up together, imparting to each other shelter and fragrance, it may contribute to their mutual advantage; but if they become so closely united as to grow from the same stalk, and depend on the same nutriment, then take away one, and both will perish. Connubial love should, therefore, be regulated by reason. Extremes are seldom durable. Violent love in the marriage state may change to hatred; and an unusual quantity expended on the husband or wife, may occasion a lesser degree of regard towards others. It is not an uncommon event for external enemies to occasion harmony at home; and harmony at home, or the yielding to the foolish notions of each other, may occasion enemies without. So difficult is it to act consistently, and to live in peace with all men! But the Scripture demands it, and we have a long period for studying our lesson.

In matrimony it is necessary that many things should contribute to a permanency of enjoyment. A good temper on both sides; property enough to supply the wants of a family; good health; children--not too many, nor too few, nor all of one sex; a continuance in each other's society, till both pass away gradually as the twilight into darkness: but, if chilly poverty exert its influence; if the husband or the wife be ill-tempered; if he or she be unfaithful or jealous; if love be followed by hatred; if one be taken, and the other left in solitude; if children be imperfect in birth, or habitually sickly, or drop off in early years as unripe fruit; if sons prove vicious, and daughters bring disgrace on themselves and their families; if the extravagance of children bring their aged parents in sorrow to the grave; where, then, will be the pleasure of matrimony? The cares of a family, when the family is large and unruly, are more perplexing than the cares of a state. Cardan confessed, that out of four great troubles which he had experienced, two arose from his children. When Thales was asked why he did not marry, he replied, "because I want no children." One of the ancient sages was so much impressed with the disappointments and anxieties of matrimony, that when he was asked, at what time, a man should marry? replied, "If he be young, not yet; if older, not at all."

This sentiment however, so repugnant to all our ideas of social improvement, as well as to the command of our Creator, who presented woman to man as a helpmate, because it was not good that he should live alone, and demanded of them to "be fruitful and multiply," will find no advocates except among the disappointed, the ignorant, and the abandoned. "The love of woman" is a feeling too deeply rooted in the breast of man, and the reality of domestic felicity has been too long tested by experience, for either to be sacrificed on the altar of the revilers of matrimony, whether they be libertines, weak husbands, or misnamed "philosophers."

The dearest boon from Heaven above, Is bliss which brightly hallows home, 'Tis sunlight to the world of love, And life's pure wine without its foam. There is a sympathy of heart Which consecrates the social shrine, Robs grief of gloom and doth impart A joy to gladness all divine.

TO MY READERS.

I do not know how better to use the space that the printer always leaves me in this part of the book than to redeem the promise I made at the end of my last novel, and tell you in a few words what became of Blanche Brixton Fantelli and her husband.

But, do you really need to be told?

Could they have done anything else than live in connubial felicity, after the man had proved himself so noble and the woman had learned to appreciate him at his true worth?

Well, whether they could or not, they didn't. Blanche is the happiest of wedded wives. She still holds to her theory that marriage is based on wrong principles, and that the contract as ordinarily made is frightfully immoral; but she says if all men were like "her Jules" there would be no trouble.

In this she proves herself essentially feminine. She is learning, albeit a little late, that man was not made to live alone, and that the love a mother feels for her child is not the only one that brings joy to a woman's breast.

Fantelli does not claim that Blanche is his property. He is her lover still, even though he has gained the law's permission to be her master. He recognizes that she has rights in herself that are inviolable. This is why they live together so contentedly. She would not be his mate on any other terms.

If it is not the ideal existence, it is very near it. As near as a man and woman who care for the world's opinion can live it in these days.

And now, with heartfelt thanks for the continued favor of the reading public, which I am conscious is far beyond my desert, I bid a temporary farewell to American shores. By the time this book is on the shelves of the dealers I shall be on European soil, there to remain, I trust, for the better part of a year. Wherever I am, my thoughts will always turn to you who have made these journeys possible, and there as here my pen will continue devoted to your service.

ALBERT ROSS.

Cambridge, Mass., _June 1, 1895._

A BLACK ADONIS.

CHAPTER I.

A REJECTED MANUSCRIPT.

"A letter for Mr. Roseleaf," he heard his landlady say to the chambermaid. And he was quite prepared to hear the girl reply, in a tone of surprise:

"For Mr. Roseleaf! This is the first letter he has had since he came."

The young man referred to stood just within his chamber door, waiting with some anxiety for the letter to be brought to him. He was about twenty years of age, of medium height, with rather dark complexion, curling hair and expressive eyes, and with a natural delicacy of manner that made him seem almost feminine at first view.

He had the greatest possible interest in the letter that the postman had just brought, but he was far too polite to disturb the landlady or her servant, who were not yet through with it.

"You can see that it is from a publishing house," commented Mrs. Ranning, inspecting the envelope with care. "It is from Cutt & Slashem, who bring out more novels than any other firm in the city. I told you he was some kind of a writer. Perhaps they are going to publish a book for him! If they do he will leave us for finer quarters. Novelists make a mint of money, I have heard. We must do our best to keep him as long as we can. Be very polite to him, Nellie. He appears to be an excellent young man."

Shirley Roseleaf's anxiety to get possession of his letter was not lessened by this conversation. It seemed as if his entire future hung on the contents of that envelope tarrying so long in Nellie's hands. The great publishers, Cutt & Slashem, had had a manuscript of his in their hands for nearly a fortnight. When they had definitely accepted it, his path would be perfectly clear. If they rejected it--but he had not got so far as that.

The manuscript was a romance--a romance of love! Its author had spent a great deal of time upon it. He had rewritten it with care, and finally made a neat copy, of which he was very proud. Then he had thought a long time over the question of a publishing firm. Cutt & Slashem stood at the top of their profession, and they finally received the preference. With the MSS. Roseleaf sent a pretty note, in which he included a delicate compliment on their success. The MSS. and the note were arranged tastefully in a neat white package and tied with pink twine.

After all of those precautions it is no wonder that the novelist felt surprise when days passed and no reply was sent to him. But never at any time was he discouraged. Had they intended to reject the novel, he reasoned, they could as easily have done so in three days as ten.

He pictured the members of the firm hugging themselves over their good fortune, passing the manuscript from one to the other, all eager for a taste of such a marvelous work. He did not think it egotism to believe they did not get stories like that every day.

His thoughts flew rapidly as Nellie slowly climbed the stairs. Now he would be famous, he would be courted, he would be envied! He would also be very, very rich, though that was not of so much account.

As Nellie handed him the letter he responded to her pleasant smile with one of his own, and even pressed a twenty-five cent piece into her hand. Then he closed his door behind him, bolting it in his eagerness to be alone. The morning was foggy, and he sank into a chair by the window, the only part of the room where he could see to read distinctly.

There was an attraction about the envelope. It was light buff in color, bearing the address of Cutt & Slashem in large letter on one side of the front face, besides the names of several of the most famous authors whose publishers the firm had the happiness to be.

"Shirley Roseleaf!" It would not look so badly in print.

So lost was he in the pleasant pictures which these thoughts conjured up that it was some minutes before he tore open the envelope. Then his astounded eyes rested upon these lines:

"Messrs. Cutt & Slashem regret to be obliged to decline with thanks the MSS. of M. Shirley Roseleaf, and request to be informed what disposition he desires made of the same."

Roseleaf read this dizzily. For some moments he could not understand what that sentence meant. "Obliged to decline" was plain enough; but his confused mind found some grains of comfort in the request of the firm to know what he wished done with his manuscript. They must, he reasoned, consider it of value, or they would not respond in that courteous manner. Still, he could not comprehend how they had had the asininity to "decline" it at all.

Were they unwilling to add another star to their galaxy?

Could they actually have read the tale?

A firm of their reputation, too!

When Roseleaf emerged from his temporary stupor it was into a state of great indignation. Why, the men were fools! He wished heartily he had never gone to them. They would yet see the day when, with tears in their eyes, they would regret their lack of judgment. His first act should be to go to their office and express his opinion of their stupidity, and then he would take his MSS. to some rival house. And never, never in the world--after he had become famous, and when every publisher on both sides of the Atlantic were besieging him--never, he said, should these ignorant fellows get a scrap of his writing, not even if they offered its weight in gold!

He was too excited for delay, and donning his hat, he took his way with all speed to Cutt & Slashem's office. At that instant he had more faith in his novel than ever. As he walked rapidly along he compared it with some of the stories issued by the firm that had rejected it, to the great disadvantage of the latter.

"I wish to see Mr. Cutt or Mr. Slashem," he said, imperiously, as he entered the counting room.

"Both are in," said the office boy, imperturbably. "Which will you have?"

"I will see them together."

Had they been tigers, fresh from an Indian jungle, it would have made no difference to him.

The boy asked for his card, vanished with it, returned and bade him follow. Up a flight of stairs they went, then to the left, then to the right, then across a little hall. A door with the name of the house and the additional word "Private" loomed before them.

"Come in!" was heard in response to the knock of the office boy.

Roseleaf entered, something slower than a cannon ball, and yet considerably faster than a snail. The two principal members of the firm were sitting together, with lighted cigars in their mouths, examining a lot of paper samples that lay upon a table. They did no more at first than glance up and nod, not having finished the business upon which they were engaged.

"Is it any better than the last?" asked Mr. Slashem, referring to the sample his partner was examining.

"It's just as good, at least," was the answer. "And an eighth of a cent a pound less. I think we had better order five hundred reams."

"Five hundred reams," repeated the other, slowly, making a memorandum in a little book that he carried. "And the other lot we'll wait about, eh? Paper is not very steady. It's gone off a sixteenth since Thursday."

This conversation only served to infuriate still more the visitor who stood waiting to pour out his wrath. Were these men wasting time over fractions of a cent in the price of stock, just after they had rejected one of the greatest romances of modern times!

With the precision of a duplex machine both partners finally looked up from the table at the young man.

"Mr. Shirley Roseleaf?" said Mr. Slashem, interrogatively, glancing at the card that the office boy had brought.

"Yes, sir!" was the sharp and disdainful reply.

"We need nothing in your line," interrupted Mr. Cutt. "I suppose Mr. Trimm has our other order well under way?"

The look of indignant protest that appeared in Roseleaf's face caused Mr. Slashem to speak.

"This is not Mr. Roseberg," he explained. "My partner took you for an agent of our bookbinder," he added.

The novelist thought his skin would burst.

"I am quite complimented," he said, in an icy tone. "Let me introduce myself. I am the author of 'Evelyn's Faith.'"

The partners consulted each other.

"The similarity of names confused me," said Mr. Cutt. "Is your book one that we have published?"

Saints and angels!

"It is one that was sent to you _for_ publication," replied Roseleaf, with much heat, "and has been returned this morning--_rejected_!"

"Ah!" said Mr. Cutt.

"We have nothing to do with that department," said Mr. Slashem, coming to the rescue. "You should see Mr. Gouger, on the second floor above; though if he has rejected your story a visit would be quite useless. He never decides a matter without sufficient reason."

"Oh, dear, no!" added Mr. Cutt, feeling again of the paper samples.

Shirley Roseleaf listened with wild incredulity.

"Do you mean to tell me," he said, "that you, the members of the firm of Cutt & Slashem, have rejected my story without even reading it?"

The partners glanced at each other again.

"We never read books," said Mr. Cutt.

"Never," said Mr. Slashem, kindly. "We have things much more important to attend to. We pay Mr. Gouger a large salary. Why, my young friend, there are probably a dozen manuscripts received at our office every week. If we were to try to _read_ them, who do you think would attend to the _essential_ points of our business?"

Roseleaf's contempt for the concern was increasing at lightning speed. He did not care to mince his words, for it could make no difference now.

"I should imagine that the selection of the books you are to print would be at least as important as the paper you are to use," he retorted.

Mr. Cutt looked at him in great astonishment.

"You are much mistaken," said he.

"Entirely mistaken," confirmed Mr. Slashem.

The author had no desire to remain longer, as it was evident he was losing his temper to no purpose. If it was Mr. Gouger who had rejected his work, it was Mr. Gouger that he must see.

Bowing with ironical grace to the examiners of printing paper, he took leave of them, and mounted to the sanctum of the man who he had been told was the arbiter of his fate. A girl with soiled hands pointed out the room, for there was nothing to indicate it upon the dingy panel of the door; and presently Roseleaf stood in the presence of the individual he believed at that moment his worst enemy.

There were two men in the room. One of them indicated with a motion of his hand that the other was the one wanted, and with a second motion that the caller might be seated. Mr. Gouger was partly hidden behind a desk, engaged in turning over a heap of manuscript, and it appeared from the manner of his companion that he did not wish to be disturbed.

Somewhat cooled down by this state of affairs, the young novelist took the chair indicated and waited several minutes.

"What d--d nonsense they are sending me these days!" exclaimed Mr. Gouger at last, thrusting the sheets he had been scanning back into the wrapper in which they had come, without, however, raising his eyes from his desk. "Out of a hundred stories I read, not three are fit to build a fire with! This thing is written by a girl who ought to take a term in a grammar school. She has no more idea of syntax than a lapdog. Her father writes that he is willing to pay a reasonable sum to have it brought out. Why, Cutt & Slashem couldn't afford to put their imprint on that rot for fifty thousand dollars!"

He had finished saying this before he learned that a third person was in the room. Upon making this discovery he lowered his voice, as if regretting having exhibited too great warmth before a stranger. The novelist rose and handed him a card, and as Mr. Gouger glanced at the name a gleam of recognition lit up his face.

"I am glad to see you, Mr. Roseleaf," he said. "I had half a notion to ask you to call, when I felt obliged to send you that note yesterday. There are several things I would like to say to you. Archie, perhaps you would let us have the room for a few minutes."

The last remark was addressed familiarly to the man who occupied the third chair, and who looked so disheartened at the prospect of having to rise therefrom that Roseleaf hastened to express a hope that he would not do so on his account.

"Very well," said Mr. Gouger, abruptly. "You heard what I said about this copy I have just read, though it was not my intention that you should. I supposed I was talking only to Mr. Weil, who is not in the profession and does not expect to be. Now, let me say at once, Mr. Roseleaf, that your contribution is not open to any of the objections I have cited. You have evidently been well educated. Your English is pure and forcible. It is a real delight to read your pages. Every line shows the greatest care in construction. I did with your story what I have not done with another for a long time--I read it through. Why then did I reject it?"

The question was too great for the one most interested to answer, but in the glow of pleasure that the compliment brought he forgot for the moment his bitter feelings.

"Possibly," he suggested, "Cutt & Slashem have more novels on hand than they feel like producing at present."

"No," responded Mr. Gouger, disposing of that theory in one breath. "A house like ours would never reject a really desirable manuscript. If you will reflect that only one or two of this description are produced each year you will the more readily understand me. Your story has a cardinal fault for which no excellence of style or finish can compensate. Shall I tell you what it is, and before this gentleman?"

He indicated Mr. Weil as he spoke. Roseleaf's heart sank. For the first time he felt a deadly fear.

"Tell me, by all means," he responded, faintly.

Mr. Gouger's face bore its gentlest expression at that moment. He was taking valuable time, time that belonged to his employers, to say something that must temporarily disappoint, though in the end it might benefit his hearer.

"Let me repeat," he said, "that your work is well written, and that I have read it with the greatest interest. Its fault--an insuperable one--is that it lacks fidelity to nature. Mr. Roseleaf, I think I could gauge your past life with tolerable accuracy merely from what that manuscript reveals."

The novelist shook his head. There was not a line of autobiography in those pages, and he told his critic so.

"Oh, I understand," replied Mr. Gouger. "But this I have learned: Your life has been marvelously colorless. Yet, in spite of that, you have undertaken to write of things of which you know nothing, and about which, I may add, you have made very poor guesses."

Mr. Weil, leaning back in his chair, began to show a decided interest. Mr. Roseleaf, sitting upright, in an attitude of strained attention, inquired what Mr. Gouger meant.

"Well, for instance, this," responded the critic: "You attempt to depict the sensations of love, though you have never had a passion. Can you expect to know how it feels to hold a beautiful girl in your arms, when you never had one there? You put words of temptation into the mouth of your villain which no real scamp would think of using, for their only effect would be to alarm your heroine. You talk of a planned seduction as if it were part of an oratorio. And you make your hero so superlatively pure and sweet that no woman formed of flesh and blood could endure him for an hour."

The color mounted to Roseleaf's face. He felt that this criticism was not without foundation. But presently he rallied, and asked if it were necessary for a man to experience every sensation before he dared write about them.

"Do you suppose," he asked, desperately, "that Jules Verne ever traveled sixty thousand leagues under the sea or made a journey to the moon?"

Mr. Weil could not help uttering a little laugh. Mr. Gouger struck his hands together and clinched them.

"No," said he. "But he could have written neither of those wonderful tales without a knowledge of the sciences of which they treat."

"He has read, and I have read," responded Roseleaf. "What is the difference?"

"He has studied, and you have not," retorted the critic. "That makes all the difference in the world. He has a correct idea of the structure of the moon and what should be found in the unexplored caverns of the ocean; while you, in total ignorance, have attempted to deal in a science to which these are the merest bagatelles! You know as little of the tides that control the heart of a girl as you do of the personal history of the inhabitants of Jupiter! Your powers of description are good; those of invention feeble. Either throw yourself into a love affair, till you have learned it root and branch, or never again try to depict one."

Mr. Archie Weil smiled and nodded, as if he entirely agreed with the speaker.

"What a novel _I_ could make, my dear fellow!" he exclaimed, "if I only had the talent. I have had experiences enough, but I could no more write them out than I could fly."

"It is quite as well," was the response, "your women would all be Messalinas and fiction has too many now."

"Not _all_ of them, Lawrence," was the quick and meaning reply.

"In that case," said Gouger, "I wish heartily you could write. The world is famishing for a real love story, based on modern lines, brought up to date. I tell you, there has been nothing satisfactory in that line since Goethe's day."

Mr. Weil suggested Balzac and Sand.

"Why don't you include George William Reynolds?" inquired Gouger, with a sneer. "Neither of them wrote until they were depraved by contract with humanity. If we could get a young man of true literary talent to see life and write of it as he went along, what might we not secure? But I have no more time to spare, Mr. Roseleaf. I was sorry to be obliged to reject your story. Some day, when you have seen just a little of the world, begin again on the lines I have outlined, and come here with the result."

Quite dispirited, now that the last plank had slipped from under him, the novelist walked slowly down the stairs. He did not even ask for his manuscript. After what he had heard, it did not seem worth carrying to his lodgings. His plans were shipwrecked. Instead of

the fame and fortune he had hoped for, he felt the most bitter disappointment. All his bright dreams had vanished.

A step behind him quicker than his own, made him aware that some one was following him, and presently a voice called his name. It was Mr. Archie Weil, who had put himself to unusual exertion, and required some seconds to recover his breath before he could speak further.

"I want you to come over to my hotel and have a little talk with me," he said. "Gouger has interested me in you immensely. I believe, as he says, that you have the making of a distinguished author, and I want to arrange a plan by which you can carry out his scheme."

Mr. Roseleaf stared doubtfully at his companion.

"What scheme?" he said, briefly.

"Why, of imparting to you that knowledge of the world which will enable you to draw truthful portraits. You have the art, he says, the talent, the capacity--whatever you choose to call it. All you lack is experience. Given that, you would make a reputation second to none. What can be plainer than that you should acquire the thing you need without delay?"

"The 'thing I need'?" repeated Roseleaf, dolefully.

Mr. Weil laughed, delightfully.

"Yes!" he explained. "What you need is a friend able to interest you, to begin with. Pardon me if I say I may be described by that phrase. Come to my hotel a little while and let us talk it over."

It was not an opportunity to be refused, in Roseleaf's depressed condition, and the two men walked together to the Hoffman House, where Mr. Weil at that time made his home.

CHAPTER II.

"WAS MY STORY TOO BOLD?"

"Well, Millie, your letter has come," said Mr. Wilton Fern, as he entered the parlor of his pleasant residence, situated about twenty miles from the limits of New York City. "Open it as quick as you can, and learn your fate."

His daughter started nervously from her seat near the window, where she had been spending the previous hour in speculations regarding the very missive that was now placed in her hands. She was a handsome girl, neither blonde nor brunette, with eyes of hazel gray and hair of that color that moderns call Titian red. She took the envelope that her father gave her, and though she wanted intensely to know the contents she hesitated to open it.

"Read it, Millie," smiled Mr. Fern. "Let us learn whether we have an authoress in our house who is destined to become famous."

But this remark made Miss Millicent less willing than before to open the letter in her father's presence. She slowly left the room without answering and did not break the seal of her communication till she was in the seclusion of her chamber.

And it was quite a while, even then, before she summoned the necessary courage. Some days previous she had sent a MSS. to the great publishing house of Cutt & Slashem. The writing had taken up the best of her time for a year. She had high hopes that it was destined to lay the foundation of an artistic success. Her plot was novel, not to say startling. It was entirely out of the conventional order. It would be certain to arouse talk and provoke comment, if it got into print; and to make sure that it _would_ get into print she had persuaded her father to write a little note, which she enclosed with the MSS., saying that he would pay a cash bonus, if the firm demanded it, to guarantee them against possible loss.

With this note in her mind, Miss Millicent had felt little doubt that her story would be accepted and printed. She only wondered how warmly they would praise her work. It was not enough to have them print it; she wanted something to justify her in saying to her father, "There, you see I was not wrong after all in thinking I could have a literary career!"

At last the envelope was removed, and the girl's astonished eyes lit upon this cold, dry statement:

"Messrs. Cutt & Slashem regret to be obliged to decline with thanks the MSS. of Miss M. Fern, and request to be informed what disposition she desires made of the same."

Millicent felt a ringing in her ears. Her hands grew clammy. A dull pain pressed on her forehead. She felt a faintness, a sinking at the heart. Was it possible she had read aright? Rejected, in this cruel way, without even a reference to her father's offer! It was atrocious, and, girl-like, she burst into a spasm of weeping.

How could she ever face her father? The sacrifices she had made came back to her, sacrifices of which she had thought little at the time, but which now seemed gigantic. There had been nights when she had not gone to bed till three, other nights when she had been too full of her subject to sleep and had risen in the small hours to finish some particularly interesting chapter. Twelve hundred pages there were in all, note size, in her large, round, almost masculine hand. And this time was all lost! She had mistaken her vocation. The greatest publishing house in the country had decided against her.

Gradually she dried her eyes. It would do no good to weep. She read the curt answer that had come in the mail, a dozen times. Why could not the firm have sent her a reason, an excuse that meant something? She wanted to know wherein her fault lay. It might be possible to correct it. Perhaps the state of business was to blame. The more she thought, the more determined she grew to investigate this strange affair, and within an hour she had donned her street clothes and started, without saying anything to the rest of the household of her intention, for the office of Cutt & Slashem in the city.

She knew that each large concern had one or more "readers," on whose judgment they relied in such matters. She, therefore, paused only long enough at the counting-room to get directed to Mr. Gouger. Her knock on the critic's door brought forth a loud "Come in," and as she entered she saw two men standing with hats in their hand, as if about to take their departure.

"I beg your pardon," she said, "but I wish to see Mr. Gouger."

"That is my name," responded one of the men, stepping forward.

"I am Miss Fern."

Mr. Gouger did not seem very glad to hear it. The hour of one had just struck, and he was about to go to his lunch. He recognized the girl's name, as that of the author of the MSS. he had criticized so severely to his friend, Weil, who was, by-the-way, the third person in the room at this moment. Had she sent up her card, as is usual with women, he would have avoided seeing her at any hazard.

Mr. Weil took a long survey of the young lady, and then retired to the vicinity of the front windows. He pretended to interest himself in the rush of traffic that was going on in the street below, but he missed nothing of what was said, and stole from time to time a glance at his two companions, particularly the younger one.

"A mighty pretty girl," was his mental comment. "I hope Lawrence isn't going to be nasty with her."

Mr. Gouger motioned Miss Fern rather stiffly to a seat.

"I do not wish to detain you," she said, with feminine inconsistency, as she accepted it. "I only want to know, if you will be so kind as to tell me, what is the trouble with my story."

The critic was pleased at one thing. Miss Fern's voice was reasonably clear. She had finished her weeping at home. There was to be no scene, something he dreaded, and in the course of his connection with this house he had experienced scores of them. He inspected his caller critically in the few seconds that elapsed while she was asking this question, and when she paused he decided to answer her with as much of the truth as he dared use.

"The fact is," he began, "a firm like ours is unable to use more than one novel out of fifty that is submitted to it. Of our friends who send us manuscripts, the vast majority must, therefore, be disappointed. Now, your story--shall I be frank?"

"By all means," answered Miss Fern.

"Your story, though written with spirit and power, needs a great deal of revision from a--from a rhetorical standpoint. It is, in fact, carelessly put together. That is a cardinal fault in a literary production, and one for which no amount of talent, or even of genius, can compensate."

The girl listened with deep interest. She tried to think where the blemishes alluded to could be, for she had read the story twenty times. To say nothing of several girl friends, who had listened with evident wonder and delight, to various parts of the tale, as it progressed.

"If that is true," answered Miss Fern, slowly--, "could not the trouble be remedied by sending the MSS. to some very competent person and having the errors made right?"

Mr. Gouger smiled.

"Hardly," he said. "A novel is like a painting. The _ensemble_--do you understand?--is the thing. Can you conceive a painting being 'done over'? Your book would lose its quality if subjected to that process."

A look of discouragement crossed the features of the young woman.

"Of course, you know best," she stammered. "What would you advise me--try again?"

Mr. Gouger raised both his hands.

"It is difficult to say, in such a case," he replied. "But--if you want my best opinion--"

"That is just what I want," said the girl, with ill-concealed impatience.

"You are not dependent upon your exertions, I suppose, for a living?"

Millicent shook her head, almost sorry at the moment that she could not reply in the affirmative.

"Then--I should give up the idea of being an authoress."

This was very unpalatable medicine, and the critic realized it as he looked at the sombre face before him.

"Is your rejection of my story based at all," asked Miss Fern, after a pause, "on the--boldness of its subject?"

Mr. Gouger smiled again.

"We publish the works of Hall Caine and George Moore," he said. "I should not consider your story overbold, if there was nothing else against it. It is a wonder to me, and always will be, why such young girls as you choose _risque_ themes, but if the work is well done the public will pay for it."

There was a slight blush on Miss Fern's face, partly at the insinuation and partly at the adverse criticism that had crept thoughtlessly into the sentence.

"For my part," she explained, "I wanted to write something that would attract attention--that would put my name prominently before the public and keep it there. The girls I read it to thought the scenes just lovely, though some said perhaps their mothers would not feel that way. And I told them that the mothers of to-day were very old-fashioned, and that the public taste was changing rapidly. If the story is too bold, there are things I could cut out of it, but if you say that would make no difference, I would rather let them stand. I intend to try some other concern before I give up."

Mr. Archie Weil had abandoned all pretence of looking out the window. He stood with his eyes fastened on the pretty girl, as she made these statements in such a matter-of-fact way. He wondered what the dickens the story was about, and made up his mind that he would try to get possession of it.

"All the same," responded Mr. Gouger, who had apparently forgotten his lunch in his growing interest in the conversation, "I don't see where girls like you obtain such an intimate knowledge of things. You are not over twenty--excuse me, I am old enough to tell you this without offence. It is not you alone, but a hundred others who have made me ask myself this question. As soon as the modern girl gets a bottle of ink and a pen and begins to let her thoughts flow over paper, it transpires that she knows everything--more than everything, almost. Why, I was twenty-five before I was as wise as the heroine of sixteen, in this story of yours!"

Miss Fern reddened again, all the more because she had glanced up and encountered the bright eyes of Mr. Weil fixed upon her.

"Why, Archie," pursued the literary man--he turned toward Mr. Weil--"you remember Lelia Dante, you have seen her here. Five or six years ago I got a letter from that young girl's mother asking me to come to their residence and hear a story she had written. It was her first one, and the child was not a day over seventeen. I couldn't believe it when she came into the room, with her hair tumbled about her shoulders, and began to read to me the first chapter of 'Zaros.' 'Did _she_ write that?' I asked her mother, incredulously. 'Certainly,' she replied. 'Without aid from any one?' 'Absolutely alone.' My hair stood on end. I could not keep it down for the next week with a brush. You know the story. We printed it, and it sold well, and that is all that C. & S. cared about it; but I never understood how that infant could conceive it. No more than I can understand your ability to write this story of yours, Miss Fern," he added, pointedly.

The young woman bridled a little.

"It does not matter much, if you are not going to print it," she said, raising her eyes to his.

He bowed low to express whatever apology might be necessary.

"I would have accepted it if I could," he said. "My entire life is spent in reading manuscripts in the hope of discovering one that will make a hit with the public to whom we cater. When successful I am as pleased as a South African who fishes a diamond of the first water out of the mine. Your story, Miss Fern, shows decided talent. You have a greater knowledge of some of the important things of life, I will wager, than your grandmother had at eighty, if she lived so long. As I am obliged to go now, let me add, without mincing matters, that you are very deficient in English grammar, and that nothing you can write will be acceptable to any first-class house until that fault is remedied. Are you ready, Archie?"

Mr. Weil felt indignant. He could not have spoken to any girl as pretty as this one in such language, and he thought it quite inexcusable on the part of his friend to do so. Mr. Gouger, though feeling that it was best to use little circumlocution, had not meant to wound his caller. But her countenance showed that he _had_ wounded her, and the natural gallantry of his younger companion came to the rescue.

"I am not ready yet," said Mr. Weil, telegraphing at the same time a series of signals with his eyes. "I want a few minutes' talk with Miss Fern, if you will introduce me. I think I can say something she will like to hear."

Mr. Gouger, who now stood in such a position that Miss Fern could not see him, shook his head to imply that he did not fancy this arrangement; but he ended by saying, "Very well." He then abruptly made the presentation, put on his hat, said good-by, and vanished.

Miss Millicent, who had risen, turned with an air of puzzled inquiry toward Mr. Weil.

"Be seated again, for a moment," he said, politely. "I want your permission to read your story."

"Why, I don't know," she answered. "Are you one of the employes of Cutt & Slashem?"

He smilingly denied the imputation.

"I have not that felicity," he added, "but I am much interested in things literary, and have a rather wide acquaintance in this line of business. If I could be allowed to read your MSS. perhaps I should form a milder opinion of its faults than my unbending friend. And in that case a word from me, to another house, would certainly do you no harm."

A brighter light came into Miss Millicent's eyes.

"I shall be only too glad to have you read it," she answered. "It is hard to believe that I have wasted almost a year in something entirely worthless. You may take it with pleasure."

Mr. Weil went to Mr. Gouger's desk, from which he soon came with the parcel in question. He untied the string and for a moment his gaze rested on the handwriting.

"Do you live far from here?" he began; and then added, as he noticed the address on an enclosed card, "Ah, I see! At Midlands."

She explained herself rather more to him, giving the full address of her father, and some particulars about the manner in which she had been drawn into attempting literary work. He listened intently, all the time engaged in rapid thought.

"The best way for me to get a thoroughly correct impression of this novel," he said, when she came to a pause, "is to hear you read it aloud. In that manner," he added, as he saw that she was about to interrupt, "a hundred meanings would come to the surface that a mere inspection of the pages might fail to show. Beside, there would be an opportunity for discussion. If convenient to you I would gladly come to your residence for this purpose."

The eyes of the young girl brightened. She was greatly pleased at the idea and said so without delay.

"Very well," said Mr. Weil, more than delighted with the success of his experiment. "To-day is Tuesday; shall I come for the first time, say, Thursday evening?"

"That would suit me perfectly; or to-morrow, if you wish. I shall put aside everything and have my time free for you."

Mr. Weil nodded.

"Let it be Thursday then. And the hour--shall we call it eight?"

The time was promptly agreed to.

"In the meantime, I will take the MSS. and look it over, to form a general idea of the plot. Here is my card. By-the-way, you will of course arrange it so that we shall not be interrupted during our conference. It disturbs anything of that kind to have people coming in and out. We want to be entirely alone so as to give our full attention to the work in hand."

Miss Fern smilingly acquiesced, saying that it was exactly what she would wish.

"And do you think there may be hope for it yet--that poor little manuscript?" she asked, as she stood by the door ready to take her departure.

"That is a question I can hardly answer," he replied. "I shall be better able to tell you in a week or two, I trust."

She lingered, with her hand on the door knob.

"My father is willing to take all the financial risks," she said. "That ought to make a difference, don't you think so?"

"It would, with many houses," he admitted. "I am glad to know these things. Thursday, then, Miss--Miss Fern."

He wanted to call her "Millicent," for he had read the name on the package he still held in his hand; but on the whole he concluded that this would be a little premature.

CHAPTER III.

"HER FEET WERE PINK."

When Miss Millicent Fern entered the office of Lawrence Gouger, as detailed in the preceding chapter, it will be remembered that she found that gentleman and his friend, Archie Weil, with their hats in their hands. The fact was that Mr. Weil had but just entered the room, and that Mr. Gouger had accepted an invitation to take lunch with him, an arrangement that was by no means an infrequent one between them. The entrance of Miss Fern, and the subsequent proceedings, compelled the literary critic to go out alone, as has been seen. When he returned he found Mr. Weil still there.

"Haven't you been to lunch yet!" exclaimed Mr. Gouger.

"I have not been out of this office," was the reply, "and all appetite for anything to eat has left me. Lawrence, that is one of the most interesting girls I ever met."

Mr. Gouger pursed up his lips, and uttered an impatient, "Pah!" He then remarked that Mr. Weil had a habit of finding such a quality in the latest women of his acquaintance.

"What does she amount to?" he asked. "An overgrown schoolgirl, who did not half learn her lessons. Read that MSS. she left here, and get disillusionized in short order. Why, she doesn't even know how to spell, and her periods and commas are in a hopeless tangle."

His companion eyed him quizzically.

"Are periods and commas, even a correct spelling of the English language, the only things you can see in a bright, handsome girl?" he demanded. "For shame, Lawrence! You are a dried-up old mummy. Your senses are numb. A lively wind will come in at the keyhole some day and blow you out of that chimney."

Mr. Gouger heaved a sigh, as if to say that discussion with such a nonsensical fellow was useless, and took his seat at his desk, where an unfinished pile of MSS. awaited his reading.

"She's given me leave to take her story home," said Mr. Weil, with a mischievous expression.

The critic stared at his friend.

"Given it to you?" he repeated. "How did that happen?"

"I asked her for it, naturally. You were so severe on the poor child, that I couldn't help putting in a cheering word. We talked of the whole business, and she was willing I should see if my opinion agreed with yours."

"_Your_ opinion!" echoed Gouger, testily. "What is that worth? But take the stuff, if you want it, and when you are done, send it to her; it will make less rubbish in this confounded hole. One thing I'll tell you, though, in advance. You'll never be able to make sense of it, unless you get some one to straighten it out."

"That's all right," replied the other. "After I have read it through, I am going to Miss Fern's house, where she will read it to me."

Mr. Gouger started from his chair.

"You don't mean that!" he exclaimed.

"But I do. She asked me, and I'm going. I understand that it's a rather bold tale, and I can conceive nothing more entertaining than to hear that kind of thing from the red lips of such a pretty piece of flesh and blood as has just left here."

There was an uneasy expression on the face of the critic as he heard these words. He liked Weil, although they were as different in their natures as two men could well be. He wanted to please him, but the aspect of this affair was not agreeable.

"Look here, Archie," he said, earnestly, "there are some things that I can't permit, you know. My office must not be made a starting-place for one of your lawless adventures. You met Miss Fern here. Now, I protest against your going to her house, pretending that you are interested in that novel, when your real purpose is of a much more questionable kind."

Mr. Weil put on the air of one whose feelings are lacerated by an unjust suspicion.

"My dear Lawrence--" he began.

"That's all right," growled the critic. "I may or may not be your 'dear Lawrence,' but I know you like--like a book," he added, hitting by accident on a very excusable simile. "You are an old dog that is not likely to learn new tricks. I shall send this MSS. back to Miss Fern, myself, enclosing a letter warning her to have nothing to do with you."

A laugh escaped the lips of Archie Weil at this proposition.

"If you knew the feminine mind half as well as you do modern literature," he answered, "you would see how little that would avail. I have met Miss Fern and made a distinctly favorable impression. Her address is in my pocket, and I have received a pressing invitation to call. If you choose to send the MSS. by another messenger you will relieve me of the task of carrying a bundle, but you will accomplish nothing more."

Mr. Gouger's mouth opened in astonishment at the evident advantage which his friend had gained in so short a time.

"You must have convinced her that your literary opinions are of value," he said, presently. "If I write that you are a charletan and entirely unworthy of attention, what will happen then?"

The smiling gentleman opposite crossed his hands over his left knee, and did not delay his answer.

"I will tell you," he said. "In the same mail she will receive a letter from me, warning her that a certain party, who has given an adverse judgment on her writings, may attempt to influence her against others more likely to decide in her favor. She will be told that, having rejected a book, this certain party does not wish any one else to print it. Send the severest note you can construct,

Lawrence. I have few talents, but I know how to write letters."

The critic could hardly believe that fate had thrown so many cords around his neck in the brief space of one hour, but the more he thought the more he became convinced that his best course was to shut his eyes.

"Well, gang your gait," he said, after a long pause, during which the look of triumph deepened on his companion's face. "You will have to answer for your own sins. But I'll tell you one thing, that may save your time. Women who write racy novels are almost without exception remarkably correct in their own lives."

Mr. Weil inquired if his friend was certain of this, and there was a suspicion of disappointment in his tone.

"Absolutely," said Mr. Gouger, refreshing his memory. "I can think of a dozen instances to prove the point. There is Lelia Dante, for instance, who writes like a--like a--well, you know how she writes. She sticks to her mother's apron strings like a four-year-old child. They never are seen apart, I am told. Then there is Mrs. Helen Walker Wilbur, the poetess. We have a volume of her verse that is positively combustible from its own heat. The sheets had to be run off the press soaked in water to keep them from igniting. The room was full of steam all the time the work was going on. Warm! I should say so! Now, that woman is vain, and she dresses foolishly, and she does odd things for the sake of being talked about--but nobody questions her loyalty to her husband. You would think by some of her poems that an East Indian regiment would not suffice for her, and yet she is the straightest wife on Manhattan Island. Oh, I know so many cases. You remember that girl who wrote, 'Love's Extremities,' a work as passionate as Sappho. She is a little Quaker-like maiden,[A] who dresses and talks like a sister of one of the Episcopal guilds. These women are on fire at the brain only. They would repel a physical advance with more indignation than those endowed with less esthetic perceptions. So, see Miss Fern as much as you like. Should you attempt anything improper you will prove the truth of my assertions."

[Footnote A: Now dead, alas!--A. R.]

Mr. Weil changed the knee he had been nursing, but the quiet smile did not leave his countenance.

"What an inconsistent fellow you are, Lawrence," he said. "I could convict you of a hundred errors of logic. Do you remember telling Mr. Roseleaf that a man should have a passion before he attempts to depict one."

"And I say so still," retorted Gouger. "_You_ don't call the ravings of these poetesses and female novelists real life, do you? _You_ know the actual lover isn't content with kissing the hair and the feet of his divinity! There is more about women's _feet_ in these poems and novels than all the rest of their anatomy put together. And what is a woman's foot? Did you ever see one that was pretty--that you wanted to put to your lips?"

"Yes," interrupted Archie, dreamily, "once. At Capri. She was fifteen. Her feet were pink, like a shell. She was walking along the shore in the early evening."

"With the dirt of the soil on them!" exclaimed Mr. Gouger, in disgust.

"No, she had just emerged from her bath. The sand there was clean as a carpet, cleaner, in fact. Gods! They were exquisite!"

The critic uttered an exclamation.

"I waste time talking to you," he said, sharply. "You are like the rest of the imaginative crowd. It is a pity you were not gifted with the divine afflatus, that you could have added your volumes to the nonsense they print."

"And which you are always glad to get," interpolated Mr. Weil.

"Because it will sell. Cutt & Slashem are in this business to make money, and my thoughts must be directed to the saleable quality of the manuscripts submitted. If _I_ was running the concern, though, I would touch the mooney, maundering mess. It makes my flesh creep, sometimes, to read it."

Archie Weil uttered another of his winsome laughs.

"How would you like to be a serpent," he asked, "and have your flesh creep all the time? But before we dismiss this matter of Miss Fern, I want you to clear your mind, if you can, of the haunting suspicions you always have when a woman is concerned. You know there are concerns in the city who would print her book, with a proper amount paid down, if it had neither sense, syntax nor orthography. If she wants it fixed up, I can find tailors to help her out; and if her papa wants it on the market, why shouldn't he be

able to get it there? Now, let us talk a little about Roseleaf."

Mr. Gouger brightened at the change of subject. His interest in Mr. Roseleaf was genuine, and he had already learned that Archie had formed a sort of copartnership with the novelist, in the hope of making his future work a success. While the critic could not be said to have any real faith in the arrangement, it certainly interested him.

"What strange freak will you take to next?" he asked. "And do you really expect to make a novelist out of that young man?"

Mr. Weil's eyes had a twinkle in them.

"Didn't you say, yourself, that it could be done?" he inquired. "If I have made any mistake in my investment, I shall charge the loss to you."

The critic reflected a minute.

"I'm not so certain it _can't_ be done," he said. "But that's quite different from investing money in it, as you are doing. A man wants pretty near a certainty before he puts up the stuff."

"You greedy fellow!" exclaimed Weil. "Will you never think of anything but gain? I have to spend about so much money every year, in a continual attempt to amuse myself, and it might as well be this way as another. I have a document, signed and solemnly sealed, by which I am to back him against the field in the interest of romantic and realistic literature, and in return he is to give me a third of the net profits of his writings. I don't know that I have done so badly. Perhaps you may live to see Cutt & Slashem pay us a handsome sum in royalties."

Mr. Gouger looked oddly at his friend, whose face was perfectly serious.

"What are you going to begin with?" he asked.

"Love, of course. It is the A B C, as well as the X Y Z of the whole business."

"What kind of love?"

"The best that can be got," replied Weil, now laughing in spite of himself. "The very finest quality in the market. Oh, we shall do this up brown, I tell you."

"What have you done so far?" asked Gouger.

"You want to know it all, eh?" responded Mr. Weil. "I don't think I am justified in letting you too deeply into our secrets. However, you are too honorable to betray us, and so here goes: I have instructed my protege that he must fall violently under the tender passion before next Saturday night."

"With a lady whom you have selected, of course?"

"By no means. He must catch his own sweethearts."

Mr. Gouger played with his watchchain.

"And this is Tuesday," he commented. "Do you think he will succeed?"

"He must," laughed Weil. "It's like the case of the boy who was digging out the woodchuck. 'The minister's coming to dinner.'"

"You might at least have got an introduction for him," said Gouger, reflectively.

"Not I. There's nothing in our agreement that puts such a task on me. Besides, there's no romance in an introduction. He would write a story as prosy as one of Henry James' if he started off like that."

Mr. Gouger nodded his head slowly.

"That would be something to avoid at all hazards," he assented.

And at this juncture, to the surprise of both the parties to this conversation, the young man of whom they were speaking entered the room.

"I was telling Mr. Gouger of our agreement," said Mr. Weil, as soon as the greetings were over. "How do you get along? Have you discovered your heroine yet?"

Mr. Roseleaf answered, with an air of timidity, in the negative.

"I don't quite know where to find one," he said.

Mr. Weil spread out his arms to their fullest capacity.

"There are thirty millions of them in the United States alone," he exclaimed. "Out of that number you ought to find a few whom you can study. What a pity that _I_ cannot write! I would go out of that door and in ten minutes I would have a subject ready for vivisection."

The younger man raised his eyebrows slightly.

"But, that kind of a woman--would be what you would want--the kind that would let you talk to her on a mere street acquaintance!"

Mr. Weil leaned back in his chair and stretched his legs.

"Oh, yes," he said. "She would do for a beginning. Don't imagine that none of these easy going girls are worth the attention of a novelist. Sometimes they are vastly more interesting than the bread and butter product of the drawing rooms. It won't do, in your profession, to ignore any sort of human being."

Roseleaf breathed a sigh as soft as his name.

"You were right, Mr. Gouger," he said, turning to that gentleman. "I do not know anything. I have judged by appearances, and I now see that truth cannot be learned in that way."

"All the better!" broke in Archie. "The surest progress is made by the man who has learned his deficiencies. You remember the hare and the tortoise. I have read somewhere that the race is not always to the swift. You must treat your fellow men and women as if you had just arrived on this earth from the planet Mars. You must dig through the strata of conventionality to the virgin soil beneath. The great human passions are lust and avarice, though they take a thousand forms, in many of which they have more polite names. For instance, the former, when kept within polite boundaries, is usually known as Love. As Avarice makes but a sorry theme for the romantic writer, Love is the subject that must principally claim your attention. All the world loves a lover, while the miser is despised even by those who cringe beneath the power of his gold. Study the women, my lad, and when you know them thoroughly begin your great novel in earnest."

Roseleaf listened with rapt attention.

"And the men?" he asked.

"The men," was the quick reply, "are too transparent to require study. It is the women, with their ten million tricks to cajole and wheedle us, that afford the best field for your efforts."

Mr. Gouger, who had never been known to take so much time from his work during business hours, tried to begin his reading, but without success. When at his usual occupation he would not have been disturbed by the conversation of a room full of people, so preoccupied was he with what he had to do; but on this occasion he was too much entertained with his companions to do anything but hear them through.

"Is there no such thing as unselfish love--in a woman--love that sacrifices itself for its object?" asked Roseleaf, with a trace of anxiety in his tone.

"M----m, possibly," drawled Mr. Weil. "A female animal with young sometimes evinces the possession of that sort of thing, and women may have touches of it on occasions. That will be a good point for you to remember when you are deeper in your investigations. However, I ought not to fill your head with ideas of my own. I think what we most desire in our friend," he added, turning to the critic, "is complete originality."

The young man shifted his feet nervously.

"Pardon me," he said, "would it not be well to talk with people and learn their impressions? Then I can compare these with my own experiences, when they come. You would not send a blind man out on the street unled."

Archie Weil laughed deliciously.

"You are ingenious, when you should only be ingenuous," he replied. "You do not act at all like the young man from Mars that I have in mind. Perhaps, nevertheless, you are not wholly wrong, for even my traveler from that planet might have to ask his way to the nearest town. Supposing you had just reached the earth, and had met me with a thousand questions. What could I answer that would be of any use?"

Mr. Roseleaf reflected a moment.

"You could tell me your idea of a perfect woman," he suggested.

"Well, I will," said Weil, glancing meaningly at Mr. Gouger. "The perfect woman is about nineteen years of age. She is neither very light nor very dark. Her eyes are hazel, with a touch of gray in them. She measures, say, five feet, four inches in height, and--about--twenty-two inches around the waist. She has a plump arm, not too fleshy, a well-made leg, a head set on her shoulders with enough neck to give it freedom and grace of movement, but not sufficient to warrant comparison with a swan, or even a goose. Her hands match her feet, being not too slender nor too dainty. Her hips are medium, but not bulging. She weighs in the vicinity of a hundred and twenty-five pounds. And her hair--there is but one color for a woman's hair--is Titian red."

The young man had taken out his note-book and rapidly sketched this list of attractions.

"Every woman cannot have Titian hair," remarked Mr. Gouger. "Would you condemn one with all the other attributes on account of missing that?"

"I would, decidedly," was the reply, "when it is obtained so easily. I think it only costs two dollars a bottle, for the finest shade. Have you written it all down, Mr. Roseleaf?"

The young man ran over his notes.

"I have it--all but the hair," he said. "Of course I could not forget that."

"Very well. And this hair must be long enough, but not too long, remember, for everything unduly accentuated spoils a woman. It should hang about five inches below the waist, when unfastened, and be thick enough to make a noticeable coil. There should be sufficient to hide her face and her lover's when he takes her in his arms."

Mr. Roseleaf started slightly.

"Then she should have a lover?" he remarked, curiously.

"Undoubtedly. Else why the hair and the arms, and the five feet four! It is a woman's business to be loved and to make herself lovable. When you have found this woman, if she has no lover, you will be expected to officiate in that capacity. If she has one, you must supplant him as soon as possible. And when you have fallen desperately, ravingly in love with such a creature, you will not have to come to me for further advice."

The young man surveyed the speaker with the utmost gravity.

"Have _you_ ever been in love?" he inquired.

"Never."

"Why?"

"It was not necessary; _I_ did not intend to write novels," said Archie, with a laugh. "But, come, we have bothered Lawrence enough. Let us go."

He took the package containing Miss Fern's story, and sauntered out, paying no attention to the peculiar glances that his friend, the critic, threw at him as he was leaving.

CHAPTER IV.

WITH TITIAN TRESSES.

Mr. Weil deciphered the MSS. of Miss Fern with some difficulty. Not that the handwriting was particularly illegible, though it did not in the least resemble copperplate engraving; but, as Mr. Gouger had intimated, the sentences were so badly constructed, and the punctuation so different from that prescribed by the usual authorities, that he was continually obliged to go back over his tracks and hunt for meanings. Nevertheless, within an hour from the time when he sat down in his room at the Hoffman House and opened the package he had brought, he had to confess himself deeply interested.

Miss Fern had conceived some entertaining characters, and some very unconventional situations. Her people were virile; her hero was strong if not always grammatical; her heroine did and said things not common in real life, and yet that were quite reasonable when her peculiar nature and environment were considered.

Archie paused once in awhile to wonder how much of all this record was within the direct knowledge of the young authoress; which expressions conveyed her own ideas and which sentiments she would personally endorse. Gouger might be right as to the exceeding purity of most of the ladies who dealt in eroticism, but in this especial case Mr. Weil meant to make an investigation on his own account before he accepted as a universal rule the one his friend had laid down.

He did not go to sleep that night until he had finished his story. Had it been arranged by a competent hand he could have read it in four hours, but as it was he consumed eight in the work. With all its faults, he liked it. There was something breezy about it, and it had a theme that he did not remember had been treated exactly in the same way before. Though, as he himself had said, without much talent for composition, Archie had read a great many books. It is no proof because a person cannot write that he would make a poor critic. Mr. Weil might almost have filled Lawrence Gouger's place at Cutt & Slashem's. He had written fugitive pieces in his time for the papers, in reference to his travels, which had been extensive, and had even contributed occasional book reviews to the magazines. His connection with Gouger enabled him to keep in touch with what was going on in the literary world, and the dozens of new volumes which passed through that office were always at his disposal.

"She's not a fool, by any means," he remarked to himself, when he put down the last sheet of Miss Fern's work. "A fellow who understood his business might put that into such shape that it would be worth using. I mean to find some one who can do it, and suggest the idea to her, when I get to that stage in this affair. Let me see, who do I know that could undertake it?"

He had begun to undress, and was in the act of taking off his collar as he spoke. His mind ran over a list of struggling literary men. Something seemed the matter with most of them. There was Hamlin, but he would be too exacting, and would want to suggest alterations in the story itself, which would never do. There was Insley, whose last three books had been flat failures, and for whom Cutt & Slashem had positively refused to print anything more; but Insley had gone into the country for the summer and nobody knew his address. Then there was--

"_Roseleaf!_"

Archie received this thought like an inspiration. He threw his cravat on the bureau and began tugging at his shoestrings to the imminent danger of getting them into hard knots that no one could unravel. Roseleaf! Why not? The boy would do almost anything he suggested, so great was his confidence that a road to literary preferment could be staked out over that path. Roseleaf would not undertake the work for the sake of pecuniary compensation, but the thing could be presented to him in quite another light. In Miss Fern's story there were living, breathing men and women. In his own there were beautifully drawn marionettes. He could be made to see that the study of the young lady's method was worth his while. And then!

Mr. Weil's shoes lay on the floor, in the disorder of a bachelor who had never in his life taken pains to put anything in the place where it really belonged. He took out the studs of his shirt, pulled that garment over his head, and then sat for some minutes wrapped in active thought.

"They must be introduced to each other!" he exclaimed, at last. "Between them they have every qualification for success; apart they are like the separated wheels of a watch. There is Shirley, with a style so sweetly subtle, a grace so perfect, every line a gem; and with it all not a sign of human emotion. There is Millicent, full of plot and daring and breathing characters, and bold conceptions, and no more able to write good English than an Esquimaux squaw. I have both these interesting persons on my hands, and I must combine them, for their mutual good.

"I wonder what Gouger will say when I unfold my plan. Perhaps I had best not tell him. He actually came near threatening, to-day, to send a line to Miss Fern, warning her against me. He wouldn't have done it, though. Lawrence has a bark that is worse than his bite by a great deal. Yes, I'll bring these young folks together. I'll take them as Hermann does the rabbits, and press them gently but firmly into one. And then sha'n't we get a combination! And won't Mr. Lawrence Gouger hug himself when the product of their joint endeavor comes to him for a reading!"

The muser finished disrobing and donned his night robes, but it was a long time before he felt like slumber. He could think of nothing but his scheme. As he revolved it over in his mind, it took many new forms. At first Roseleaf was to be asked to rewrite the story that Miss Fern had offered Cutt & Slashem. And afterwards there must be an entirely new novel, conceived together and worked out slowly, using the best of what was brightest in both of them.

The last idea Mr. Weil had before he relapsed into unconsciousness contained two novels, worked out at the same time. Roseleaf was all right, if he could only get a glimpse of realism into his work. Miss Fern would have no trouble if her ideas could find a garb that suited them.

There would be a way to make them of service to each other, and the time to cross a bridge is always when you come to it. So thought Archie Weil, as he fell asleep.

In the morning he laughed to think of the description he had given to Shirley, in his offhand way, of "the perfect woman." It was a faithful list of Miss Millicent's charms, so far as they were apparent to him. Shirley had noted them down with great carefulness, and would be sure to notice how fully the authoress met the ideal he now had in mind. It only remained for the schemer to say something to Miss Fern that would suggest Roseleaf to her, whenever they were made acquainted.

It must be plain to the reader that Mr. Weil's principal intention in this whole matter was to dispose of the _ennui_ which idleness brings even to its most adoring devotees. He had a fair fortune, accumulated by a father who had denied himself every luxury to amass it. Drifting to New York, he had found the vicinity of the Hoffman House very agreeable, and his companions, with the exception of Mr. Gouger, were of about as light views of life as himself. The critic was one of those strange exceptions with which most of us come in contact, where persons of entirely opposite tastes and inclinations become attached friends.

Breakfast was served so late to Mr. Weil that he had not finished that repast when the young novelist made his appearance. Seating himself on the side of the table that faced his friend, Mr. Roseleaf responded to the latter's inquiries in regard to his health by saying that he was quite well. Indeed, he looked it. His eye was bright, his cheek rosy. His attire showed just enough of a negligent quality to be attractive. There was an air about him such as is often associated with an artist of the pencil and brush.

"Never better in health," he said, "but very anxious to begin something definite in the way of work."

Mr. Weil smiled his most affable smile.

"What did I tell you to do, first?" he asked, playfully.

"To fall in love."

"Which you have not yet done!"

The young man shook his head.

"Good Heavens! And you have lost more than a week!"

Roseleaf colored more than ever.

"Isn't there something else--that I could--begin on?" he asked, humbly.

"I don't know of anything. Love is the alphabet of the novelist. You'd best go straight. Aren't there any eligible young women at your lodging house?"

The younger man thought a moment.

"No; only the chambermaid."

Mr. Weil sipped his coffee with a wise expression.

"It may come to that," he said, putting down the cup, "but we'll hope not. We will hope not. What's the matter with Central Park? There are five hundred nice girls there every afternoon."

"But I don't know them," said Roseleaf, desperately. "And--I have been there. Yesterday one of them looked at me and smiled. I walked toward her, and she slackened her speed. When I came within a few feet she almost stopped. Then--I could think of nothing to say to her, and I walked on, looking in the other direction."

Several breakfasters in the vicinity turned their heads to note the couple at the table, from which a laugh that could be heard all over the room came musically.

"Why didn't you say 'Good-morning?'"

"Yes! And she might have said 'Good-morning.' And then it would be my turn, and what could I have done?"

Mr. Weil folded up his napkin and laid it by his plate.

"You coward," he replied, affably, "you could have done a thousand things. You could have remarked that the day was fair, or that you wondered if it would rain. And you could have asked her to stroll over to a restaurant and take a little refreshment. Once opposite to her, the rest would have come fast enough."

The novelist took out a handkerchief and wiped the perspiration from his forehead. It all seemed very easy the way Archie described it, but he was sure it would be very different in practice. How could he know, he demanded, that the young lady would go to the restaurant with him? She might have declined, and then he would have been in a worse position than ever.

"Declined!" echoed Archie. "Declined a lunch? Declined ice cream? Declined champagne frappe! Well, you _are_ ignorant of the sex. My dear boy, it is evident that I shall have to introduce you to the leading lady of your company, and if you will be patient for a very few days, I hope to be able to do so."

Rousing himself with a show of genuine interest, Roseleaf inquired for further particulars.

"Listen," replied the other. "I expect, to-morrow evening, to spend a few hours in the company of one of the most charming members of her sex. She, like you, has an ambition to become a successful writer. Like you, also, she lacks some of the prime qualities that are needed for that end. It happens, however, that the things wanting are entirely different in each of your cases--that you will, if you choose, be able to supplement and perfect each other. I shall tell her that I know a young man of literary taste who will give her advice on the points in which she is deficient. With such an opening you will be at once on Easy street, and if you cannot fall in love within forty-eight hours, I shall regard you as a case too hopeless to merit further attention at my hands."

The young man's cheek glowed with pleasure.

"That is more like it," he said. "When do you think I shall be able to meet this young lady?"

"Within a week or two, at the latest. I must sound her before I trust you with her, for she is nearly as much a stranger to me, so far, as to you. Of course there is no objection--quite the contrary--to your falling in love elsewhere in the meantime, if opportunity serves."

At this moment Mr. Weil called his companion's attention to a rather corpulent gentleman who had just entered the breakfast room and was stopping near the door to hold a brief conversation with some one he had met there.

"You see that fellow?" he remarked. "Wait a minute, and I will get him over here. If you ever want to put a real character into one of your stories you will only need to take his photograph. In actual life he is as dull as a rusty meat axe, but for literary purposes he would be a godsend."

Catching the eye of the person of whom he was speaking, Mr. Weil motioned to him to come to his part of the room, and as he approached arranged a chair for him invitingly.

"Mr. Boggs, I want to present a young friend of mine to you," said Archie, rising. "Mr. Walker Boggs--Mr. Shirley Roseleaf."

Mr. Boggs went through the usual ceremony, announcing that he was most happy, etc., in the perfunctory style that a million other men follow every day. Then he took the chair that was offered him, and gave an order for his breakfast to a waiter.

"Are you a New Yorker, Mr. Roseleaf?" he asked, when this important matter was disposed of.

"Mr. Roseleaf is staying here for the present," explained Mr. Weil. "He is a novelist by profession, and I tell him there is no better place to study the sensational than this vicinity."

The young man's color deepened. He doubted if it was right to introduce the subject in exactly these terms. Mr. Boggs' next question did not detract from his uneasiness.

"Excuse me--I am not altogether up in current literature, and I must ask what Mr. Roseleaf has written."

Mr. Weil helped his young friend out of this dilemma as well as he could.

"He has written nothing, as yet; at least nothing that has been printed," he said. "He is wise, I think, in laying a deep foundation for his romances, instead of rushing into print with the first thoughts that enter his head, as so many do, to their own subsequent regret and the distress of their readers. I want him to meet men and women who have known what life is by their own experiences. You ought to be worth something to a bright writer, Walker. You have had many an adventure in your day."

Mr. Walker Boggs shrugged his shoulders.

"In my 'day,' yes," he assented. "Enough to fill the Astor and Lenox libraries and leave enough for Charlie Dillingham and The American News Company. But that is nothing but history now. My 'day' is over and it will never return."

He paused and ran his right hand dejectedly across his vest in the vicinity of the waist band. Though he knew perfectly what Mr. Boggs referred to, Archie Weil wanted him to express it in his own words to Shirley.

"You wouldn't think," continued Mr. Boggs, after a pause which seemed filled with strange emotions, "that my figure was once the admiration of every lady who saw it, that they used to stop and gaze at me with eyes of positive envy. And now--look at this!"

He indicated his embonpoint again, and shook his head wrathfully.

"It is simply damnable," he continued, as neither of the others thought best to interrupt him. "When I was twenty-four I had a reputation that was as wide as the continent. When I walked down Broadway you would have supposed a procession was passing, the crowds gathered in such numbers. If it was mentioned that I would spend a week at Saratoga or Newport, the hotels had not a room to spare while I remained. The next year I married, and as one of the fashion journals put it, two thousand women went into mourning. For a decade I devoted myself entirely to my wife and to business. I made some money, and kept out of the public eye. Then my wife died, and I retired from the firm with which I had been connected. The next twelve months dragged terribly. I did not know what to do. Finally I decided that there was but one course open to me. I must resume again the position I had vacated as a leader of fashion."

Mr. Weil bowed, as if to say that this was a very natural and praiseworthy conclusion; precisely as if he had not heard the story told in substantially the same way a dozen times before. He was watching Roseleaf's interested expression and had difficulty in repressing an inclination to laugh aloud.

"I sought out the best tailor in the city," continued Mr. Boggs. "I went to the most fashionable hair dresser. I spent considerable time in selecting hats, cravats and gloves. When all was ready I took a stroll, as I had done in the old days, from Fiftieth street, down Fifth Avenue and Broadway to Union Square. I met a few acquaintances who stared at me slightly, but did not act in the least impressed. The women merely glanced up and glanced away again. What was the matter? I went home and took a long survey of myself in the mirror, a cheval glass that showed me from crown to toe. My costume was perfect. There was not a wrinkle in my face--this was several years ago, remember. There was not a gray hair in my head then--there are a few now, I admit. 'What is it?' I asked myself a hundred times as I stood there, studying out the cursed problem. My tie was all right, my shirt front of the latest cut, my watch chain straight from Tiffany's, my--ah! I saw it all in a moment!"

Roseleaf, who did not see it even yet, wore such an astonished expression that Mr. Weil had to stuff his napkin into his mouth to prevent an explosion.

"It was this devilish abdomen!" said Mr. Boggs, slapping that portion of his frame as if he had a special grudge against it and would be glad if he could hit it hard enough to bring it to a realizing sense of its turpitude. "My figure had gone to the devil! It was not as large as it is now, but it was large enough to cook my gruel. My waist had increased so gradually that I had never noticed it. I got a

tape and took its measure. Forty-two inches, sir! The jig was up. With a heart as young as ever, with a face as good and a purse able to supply all reasonable demands, I was knocked out of the race on the first round by this adipose tissue that no ingenuity could hope to conceal!"

Mr. Weil could wait no longer. His musical laugh rang out over the room.

"Let this be a warning to you, Shirley," he said, "to wear corsets."

"It is no joke," was the indignant comment of Mr. Walker Boggs, as he proceeded to add to his rotundity by devouring the hearty breakfast that the waiter had just brought him. "I am left like a marooned sailor on the sea of life. The only occupation that could have entertained me is gone. It is no time to enter business again, I couldn't have selected a wiser one to leave it. I don't want to marry, once was enough of that. The only women I can attract are those commercially inclined females that any other man could have as well as I. What is the result? My life is ruined. I take no pleasure in anything. I eat, walk about, go to a play, sleep. A _pig_ could do as much; and a pig would not have these memories to haunt him, these recollections of a time so different that I am almost driven wild."

Roseleaf felt a sincere pity for the unfortunate gentleman, and did not see the slightest element of humor in his melancholy recital. But Archie Weil could not be restrained.

"You're right about that pig business," he remarked. "You recall the incident in Mother Goose, where--

'A little pig found a fifty dollar note, And purchased a hat and a very fine coat.'

"There are strange parallels in history."

Mr. Boggs would have replied to this remark in the terms it deserved had he not been too much engaged at the moment in masticating a particularly fine chop. As it was he growled over the meat like a mastiff in bad humor.

"Are there no remedies for excessive accumulation of fat in the abdominal region?" asked Weil, taking his advantage. "It seems to me I have read advertisements of them in the newspapers."

"Remedies!" retorted the other, having swallowed the food and supplemented it with a glass of ale. "There are a thousand, and I have tried them all. I have taken things by the gross. I have paid money to every quack I could find. For awhile I starved myself so nearly to death that I went to making my will. And every day I grew stouter. I don't know what I measure now, and I don't care. A few fathoms more or less, doesn't count, when one falls from a steamer in midocean."

Mr. Weil took occasion to say that there was no need for this extreme discouragement. A little coin in the hand, or a new diamond ring, would still bring youth and beauty to his disconsolate friend.

"That's just it," retorted Boggs. "It's the contrast that's killing me. The only women who would look at me to-day are mercenary ones that wouldn't care if I was black as Othello or big as George IV. Why, I could show you a trunkful of letters, written me by the finest women in this country, when I was at my best. They breathe but one thing--love, love, love! I lived on it! It was the air that kept my lungs in motion. And I thought to go back to it so easily! _Ah!_"

Mr. Boggs commenced upon his fourth chop and emptied the last of the quart bottle into his glass.

"Well, I'm sorry for you," said Weil. "I think the times must have changed, as well as yourself, though. Now, here's a young fellow, with all the qualifications of face, figure and address that you once had, and he claims to be unable to make the acquaintance of a single interesting woman between Brooklyn Bridge and Spuyten Duyvil."

The heavy eyes of Mr. Walker Boggs rested upon the youthful face opposite to him. Under the scrutiny to which he was subjected Roseleaf reddened, in the way he had. He had never looked more handsome.

"This is evidently a jest of yours," said Boggs, turning to Mr. Weil.

"Not in the least, I assure you."

"Then I say he can do what he likes, and I know it," replied the stout man. "If I had his form I'd have to ask the police to clear the way for me. I have seen circulation impeded in front of this very hotel because I was coming out to take my carriage. If he won't look at them, why, of course, the women can't do it all, but it lies with him."

Roseleaf's eyes glistened with a strange mixture of hope and fear. He did not think he would care to be in such great demand as that, but he dearly wished to break through the iron bars that enclosed him. He glanced in a glass that paneled the wall near by. He was good-looking enough, it was no vanity to say so. What he lacked was confidence.

"He is afraid of them, that's his trouble," smiled Weil. "We will cure him of that, and when he gets to know women as they are he will give us a novel that will set all creation by the ears. Gouger--you know Gouger--says he writes the purest English. All he needs is a taste of life."

To this Mr. Boggs gave his unqualified assent. And he added that if he could be of any service in the matter he would only be too glad.

"We thank you for the offer, and may be able later to make use of it," said Mr. Weil. "And now good-morning, for we have important business to attend to."

Roseleaf looked long and earnestly at the person they were leaving. He seemed to him a very ordinary individual. If such a man had won the love of scores of beautiful women, surely he himself could gain the affections of one. When he stood with Weil in front of the hotel, by which an unrivaled procession of ladies and gentleman was already beginning to pass, though it was only eleven o'clock, he felt much encouraged.

"They are looking at you," whispered Archie, "plenty of them. Did you see those two girls in pink in that landau? Why, they nearly broke their necks to get the last glimpse of you. There is another lady who would stop if you asked her, pretty as any of them, though she must be nearly thirty. Your eyes are not open. Ah, here is something better! In that carriage, with the Titian tresses!"

It was Miss Millicent Fern, and she bowed to Mr. Weil. Then her bright eyes lit up with a new lustre as they fell upon his companion.

CHAPTER V.

STUDYING MISS MILLICENT.

When Mr. Weil made his appearance at the residence of Mr. Wilton Fern, the door was opened for him by a young negro of such superb proportions that the caller could not help observing him with admiration. He thought he had never seen a man more perfectly formed. The face, though too dark to suggest the least admixture of Caucasian blood, was well featured. The lips were not thick nor was the nose flat, as is the case with so many of the African race. The voice, as the visitor heard it, was by no means unpleasant. Mr. Weil could not imagine a better model for an ebony statue than this butler, or footman, or whatever position, perhaps both, he might be engaged to fill.

"Yes, sir, Miss Millicent is in, and she is expecting you," said the negro, in his pleasant and strong tones. "Let me take your hat and stick. Now, sir, this way."

Miss Fern came in a few moments to the parlor, where Archie was left, and greeted him most cordially.

"There is a sitting-room on the next floor," she said, "where we shall not be disturbed. I have given Hannibal orders to admit no one, saying that we shall want the evening entirely to ourselves."

"Hannibal?" repeated the visitor. "Is that the name of the remarkable individual who received me just now?"

"Yes," said Miss Fern, rather coldly. "Though I do not know why you call him 'remarkable.'"

"He is so tall, so grand, so entirely overpowering," explained Mr. Weil. "One would think he might be the son of an African king. I never saw a black man that gave me such an impression of force and power."

Millicent elevated her eyebrows a little, as if annoyed at these expressions. She answered, still frigidly, that she had noticed nothing unusual about Hannibal. She did not believe she had looked closely enough at his face to be able to identify him in a court.

"He would make a fine character for a novel," said Mr. Weil, as they walked together up the broad staircase. "I could almost write one myself, around such a personality."

The young lady looked disgusted.

"A negro servant!" she exclaimed. "What kind of a novel could you write with such a central figure?"

"Perhaps I should not put him in the centre," laughed Archie, determined to win her good nature. "Every story needs lights and shades. You can't deny that he would cast a magnificent shadow."

The humor of this observation struck Miss Fern and she joined mildly in her companion's mirth. Then she remarked that the central figure of a novel--the main thing in it--to her mind, should be a being who could be given the attributes of beauty and grace. The minor characters were of less account, and would come into existence almost of their own accord.

"And now, before we do anything more," she said, "I want you to tell me about that excessively handsome young man that I saw with you yesterday in Madison Square."

Weil was delighted at this introduction of his young friend. He began a most flattering account of Shirley Roseleaf, describing him as a genuine paragon among men, both in talent and goodness. He drew heavily on his imagination as he proceeded, feeling that he was "in for it," and might as well do his best at once. And he could see the cheek of the young listener taking on a new and more enticing color as he went farther and farther into his subject.

"If I have to rearrange my novel--the one Mr. Gouger rejected--I shall draw my hero after that model," she cried, when he paused for breath. "I never saw a man who came so near my ideal."

"But--you would have to alter your hero's character, in that case?" he said. "I have read your MSS., and your description does not tally with my young friend at all."

Miss Fern reddened.

"You don't mean to claim, do you," she replied, "that physical beauty and moral goodness always go hand in hand?"

"They should," he answered, in a tone that was meant to be impressive.

"Ah, that is another question! _Do_ they? that is all the novelist needs to know. Did you ever read Ouida's 'Sigma?' There are the two sisters, one as pure as can be, the other quite the opposite, and the beauty belongs to the depraved one. I know Oscar Wilde takes a different view in 'Dorian Grey,' but he is wrong. I am sure that the worst man or woman in the world--reckoning by what are called the 'amiable vices'--might be the most lovely to look upon, the most delightful to associate with. Eve found the serpent attractive, remember."

Where did she learn all these things? Weil looked at her with increasing astonishment. "Amiable vices." He liked the appellation.

"Perhaps you are right," he assented, as if slowly convinced. "If you wish to be acquainted with Mr. Roseleaf, I will bring him here with pleasure. My only fear is that he will not interest you. He seems almost too perfect for earth. Think of a young man who knows nothing of women, who says he has no idea what it is to be in love, who does not understand why the ladies who pass down Fifth Avenue turn their heads to look at him! He, like yourself, is a novelist, but his characters are beautiful images that lack life. He carves marble figures and attempts to palm them off as flesh and blood. He really thinks they _are_, because he has never known the difference. If you could take him, Miss Fern, and teach him what love really is--"

The young lady blushed more than before.

"_I_--" she stammered.

"In a strictly literary way," he explained. "But," he added, thinking he was getting upon the edge of a quicksand, "we must not forget the object of my visit."

He took the parcel containing her MSS. that he had obtained from Mr. Gouger, and began to untie the string. Manlike he soon had it in a hard knot, and Miss Millicent, coming to his rescue, her young hands touched his and made his heart beat faster.

"There," she said, when the knot had given way to their joint endeavors. "It is all right, now. But, before we begin on this, tell me a little more about Mr. Roseleaf. What has he written? Where was it published? I will send to-morrow morning and buy a copy."

Her enthusiasm was agreeable under the circumstances, but the truth had to be explained to her.

"What he has written I will let you see, one of these days," he replied. "As for publishing, he ran upon the same rock that you did--that of Mr. Lawrence Gouger."

The beautiful eyes opened wider.

"So he rejected his work, too! And yet you say that it was well done?"

"Exquisitely. Shirley's lines are as symmetrical as his face and figure. His people are dead, that is all the trouble. Gouger scented the difficulty under which he labors, in a moment. 'Go and fall in love!' he said to him, 'and you will write a story at which the world will marvel!'"

Miss Fern arranged one of her locks of Titian red that had fallen down.

"And hasn't he taken the advice?" she inquired, in a low voice.

"Not yet," smiled the other. "He says, like a very child, that 'he cannot find any one to love.' I walked up the avenue with him to-day, and afterwards rode in the Park. There were hundreds of the prettiest creatures, all looking their eyes out at him. And he hadn't the courage to return one glance, not one. Ah, Miss Fern, it will be genuine love with Shirley Roseleaf, if any. The imitations one finds in the fashionable world will never answer for him."

The young lady breathed a gentle sigh, as her thoughts dwelt on the handsome figure she had seen in front of the Hoffman House.

"You may bring him here--yes, I should be glad to have you," she said, slowly. "But I must ask one favor; do not tell him what I said so thoughtlessly about his being my ideal. Let me talk with him on fair terms. It may be, as you suggest, that we shall be of advantage to each other. When can you arrange it?"

"Almost any day," smiled Weil. "I will let you know, by mail or otherwise. And now, this story of yours," he added, thinking it a shrewd plan to divert her attention from the other matter while it was still warm in her mind. "Though I have read it through, and think I understand it fairly well, I am all the more anxious to hear it from your lips. You will put into the text new meanings, I have no doubt, that have escaped my observation."

Miss Fern flushed pleasantly and inquired with a show of anxiety whether Mr. Weil had found its construction as bad as his friend, Mr. Gouger, had intimated.

"To be perfectly honest, it might be improved," he replied. "But the germ is there, Miss Fern--that necessary thing for a good novel--an interest that will hold the reader in spite of himself. I disagree with Lawrence in his essential point. I am sure that a good writer of English with a taste for fiction could make all the necessary alterations without in the least detracting from the value of the story. For instance, I believe if Mr. Roseleaf would take hold of it I could guarantee to get you a publisher this winter."

"And do you think he would?" she cried.

"I think so."

The authoress was so delighted with this announcement that she conquered the slight wound to her pride. It would be herself still who had drawn the picture, who had put the coloring into it; all that the other would have to do might be described as varnishing. She took up the first sheet of her writing, and turned up an oil lamp that stood upon the table at her elbow, the better to see the lines.

"Are you ready?" she asked.

"Quite ready," smiled Mr. Weil.

In a voice that trembled a little, and yet not unpleasantly to the listener, Miss Fern began to read her manuscript. The opening chapter introduced the heroine and two gentlemen, either one of whom might be the hero. As the book is now so well known it is needless to transfer its features to these pages.

Presently the authoress paused and seemed to wait for her guest's criticism.

"That is one chapter," she said.

"Yes. I remember. And the second one is where Algernon begins to disclose a very little of his true nature. Shall we not have that now?"

"As you like. I thought perhaps you would give me advice as we proceeded, some fault-finding here and there, a suggestion of alterations."

He shook his head affably.

"Not yet," he answered. "Up to this point I see nothing that requires condemnation."

"Nor praise, perhaps?" she said, in a low tone.

"That might be true, also," he replied. "The first chapter of a novel is only the laying of the cloth and the placing of a few dishes. The viands that form the meal are still in the kitchen."

She smiled at the simile.

"But even the laying of the cloth is important," she said.

"Your cloth is laid most admirably," he answered. "And now we will have the castor, which in this case, I believe, contains a certain quantity of mustard and red pepper."

At this she laughed the more, and glanced through a few of the sheets in her hands before she spoke again.

"Did you form any opinion about--about _me_--from this story?" she asked, constrainedly. "Did you, in brief, think it had taken a bold girl to write it?"

He hesitated a moment.

"Yes," he said, at last. "A bold girl, a daring girl, a brave girl. Not one, however, whose own conduct would necessarily be like that of the woman she has delineated."

She was so pleased that she put down the MSS. and leaned toward him with both hands clasped together.

"You are very, very kind," she said, impressively.

"No, merely truthful," he replied. "With your permission I want to retain that last quality in all my conversations with you. When you ask me a question I wish to be perfectly free to answer according to my honest convictions."

"It is what I especially desire," she said, brightening. "No one able to judge has heard anything of this story except your friend, Mr. Gouger. I know it is bold, sometimes I think it is brazen. I can conceive that there are excellent people who would say it never should have been written. To my mind, the moral I have drawn more than justifies the plainness of my speech. You can tell better than I where I have overstepped the proper bounds, if there be such places. You are, of course, a man of the world--"

The protesting expression on the face of her companion arrested her at this point.

"That depends on what you mean by 'a man of the world?'"

"It is a common expression."

"And has many definitions. Before I plead guilty to it, I want to know just how much you intend by it."

Miss Fern put down the page she had taken up and a puzzled look crossed her pretty face.

"You make it hard for me to explain myself," she said. "I suppose I meant--"

"Now, be as honest as you asked me to be," he interrupted.

"Well, then, I suppose you are a man like--like other men."

"But there are many kinds of other men."

The young lady tried several times to make herself clearer, and then asked, with a very pathetic pout, that she might be permitted to proceed with her reading, as the hour was growing later. It was not a very important point, any way, she said.

"I cannot entirely agree with you," replied Archie. "If you are to be a writer of fiction, you should not consider any time wasted which informs you in reference to your fellow creatures. It is from them that you must draw your inspiration; it is their figures you must put, correctly or incorrectly, on your canvas. Don't understand me as dictating to you, my dear Miss Fern. I only wish, as long as you have referred to me, to know of what I am accused."

To this Miss Fern answered, with many pauses, that she had not intended to accuse her visitor of anything. And once more--with evident distress--she begged to be permitted to drop the matter and return to her reading.

"Very well," he assented, thinking he had annoyed her as much as was advisable for the present. "As they say in parliamentary bodies, we will lay the question on the table, from which it can be taken at some more fitting time. I am as anxious as you can be to get into Chapter II."

She read this chapter to the end, and paused a few seconds to see if he had any comments to make, but he shook his head without breaking silence, and she went on with the story. He pursued the same plan till the end of the fifth chapter.

"It is interesting, exciting and true," he remarked, referring to the closing scene. "And I cannot help feeling arise in my brain the question that Mr. Gouger put when he read it: How could a young, innocent girl like you depict that situation with such absolute fidelity."

He had come to the point with a vengeance. But to Miss Fern his manner was far more agreeable than if he had approached it by stealth, or in an insinuating way. She had anticipated something of the sort and had tried to prepare herself to meet it.

"Does not nature teach us some things?" she asked, speaking straightforwardly, though her color heightened in spite of her efforts. "Given a certain condition, an intelligent mind can prophesy results."

He shook his head in mild disagreement with her.

"Gouger is an expert, and he denies this, as a regular rule, at least. You should have heard him argue it with Roseleaf. 'Either throw yourself into a love affair,' he said, 'or never try to depict one.' Excuse me, Miss Fern, you bade me be frank--"

She assented, with a grave nod of her shapely head.

"You may have been in love--I do not ask you whether you have or not--but you cannot have known personally of the sort of love that you have depicted in these pages. I call it little less than miraculous that you should draw the scene so accurately."

She colored again, this time partly with pleasure, for she was very susceptible to compliments.

"Perhaps your statement may explain to you," she said, pointedly, "what I meant a few minutes ago by calling you 'a man of the world.' You recognize at a glance what I had to construct from my imagination."

Archie Weil's face changed as he realized how deftly he had been caught. He had meant to pretend to this girl that he was more than usually ignorant of the nether side of life.

"Don't think too badly of me because I happen to know what is clear to every man," he said, impressively.

"To every one?" she answered. "To your friend, Mr. Roseleaf?"

"Ah! He is an exception to all rules. And yet, Gouger says he can never write a successful book till he is more conversant with life than he is at present."

She looked troubled.

"With life?" she echoed. "With sin, do you mean?"

"With the ordinary things that men know, and that most of them at some time experience."

Her bright eyes were temporarily clouded.

"What a pity!" she exclaimed.

"Yes," he said, for it was his humor to agree with her. "It is a pity."

There was a pause of a minute, and then she asked if she had read enough for one evening. He answered that as it was now past ten o'clock it would not be easy to get much farther and that he would come again whenever she chose to set the time.

"You do not say much about my work," she said, anxiously, as he prepared to go.

"Silence is approval," he responded. "I can talk it over with you better when you have reached the end. I have things to say, and I shall not hesitate to say them then."

"When is it most convenient to you to come?" she inquired.

"Any time," he answered. "I don't do much that is really useful. But wait till you see Shirley. He will atone for the shortcomings you find in me."

She repeated the word "Shirley," as if to test its sound.

"You are your father's only child, are you not?" he asked, thoughtfully.

"No. I have a sister, Daisy, a little younger than I."

"And has she a literary turn, also?"

"Not in the least."

Archie arose, and Miss Millicent accompanied him to the front door. The tall negro came to open the portal, but Miss Fern told him, with the same quality of dislike in her tone which Weil had noticed before, that he need not wait.

"He is really a magnificent piece of humanity," said Archie, when the man had disappeared. "I never saw anything quite like him."

"You admire negroes, then?" said the young lady, almost impolitely.

"I like representatives of every race," he answered, as if not noticing her. "There are interesting specimens in all. I number among my acquaintances several Chinamen, a Moor, a Mexican, Jews, Portuguese and Russians innumerable. If that fellow was not in your employ I would engage him to-morrow, merely as a study."

Miss Fern took the hand he held out to her and set the next meeting for Saturday evening. Then she said:

"If you want Hannibal, perhaps papa would oblige you. I certainly would do all I could to persuade him."

CHAPTER VI.

"HOW THE WOMEN STARE!"

The next day Archie Weil lunched with Lawrence Gouger. He wanted to talk with his friend about the young author and authoress. Gouger listened with interest to the story he had to relate, and nodded approval when it appeared that Archie had behaved admirably thus far in relation to Miss Millicent.

"Do you know anything about Mr. Fern?" he asked, when the other had reached a period.

"Nothing."

"Well, neither did I, a week ago, but I have taken pains to inform myself. He is a highly respectable elderly party, who deals in wool. He married a very beautiful lady, who has now been dead eight or ten years and he lives altogether in the society of his two daughters. If you succeed in getting Millicent's book on the counters you will earn his everlasting gratitude. They say he is not literary enough himself to be a judge of its merits, and if she has fifty copies to present to the family friends it will probably be all he will ask."

Mr. Weil uttered a low whistle.

"I don't know what the family friends will say of it," he replied, "but I call it pretty warm stuff. If the list includes many prudes they will hardly thank the girl for sending such a firebrand into their houses."

"Pshaw!" said Gouger. "The world is getting used to that sort of thing, and they won't mind it a bit. Besides, they will be so lost in admiration of their cousin's name on the cover that they will think of nothing else. What did you make out of her? Is she as innocent as I predicted?"

Archie poured out a glass of Bass' ale and sipped it slowly.

"Quite," he said, as he put it down on the table. "And she's no dunce, either." He went on to tell of the trap he had fallen into. "I'm dying with impatience to get her and Roseleaf together. They'd make an idealic couple."

Mr. Gouger inquired what he was waiting for.

"Oh, I want to do the thing right," said Weil. "I want to learn her as thoroughly as I can, before I bring him upon the stage. It will take three or four evenings more to hear the rest of her novel, and another to discuss it. I shall get around to him in about a fortnight, at the rate things are going. He will keep. What do you suppose he is doing now? Writing poetry! He sent a piece a few days ago to the _Century_, and they accepted it."

"He will be gray when it appears," said the critic. "It takes a long time for anything to see the light in that publication."

"But in this case an exception will be made," said Weil. "They have assured him that it will come out in their very next issue. He will be so proud to see his name in print that I expect to find difficulty in holding him back. A poet who appears in the Century has certainly stepped a little higher on the ladder."

The critic agreed to this, and remarked that such a man as Roseleaf should give his whole attention to poetry.

"Wait!" cried Archie. "Give him time. See him after he has fallen head over ears in love with charming Millicent Fern. There is something in him, I feel sure, and between that dear girl and myself we will bring it out. By-the-way, there is a character I want you to meet," he added, as Mr. Walker Boggs came into the room. "You have never had the pleasure, I think, though you have heard me speak of him."

Mr. Boggs had his attention attracted by a waiter who was sent for the purpose and came with great willingness to occupy a seat with Mr. Weil and his friend.

"We were talking of a New York merchant just now," said Archie, when the introductions were over, "and it occurs to me that you, who know almost everybody, may have some knowledge of him. He is in the wool business, I hear, and I think you once told me you had done something in that way. His name is Wilton Fern, and he lives at Midlands."

"Do I know anything about him?" echoed Mr. Boggs. "I should say so. He was my partner for seven years, and I still have a little stake left in the concern, on which I am drawing interest."

Mr. Weil showed his astonishment at this statement. What a very small world it was, after all! Then, after pledging his friend not to mention that he had ever discussed the matter with him, he went guardedly into the particulars of Miss Millicent's book, and of his having called at the house for the purpose of passing judgment upon it.

"I didn't know that was in your line," replied Boggs.

"Well, it was this way," answered Archie. "Mr. Gouger's decision didn't exactly suit the young lady, as it was not very favorable. Mine will be quite to her taste, as I view her abilities in a more favorable light. Now tell us all about the family, as the only one of them I have met is Miss Millicent. Why, this is a regular find, old man! You should have told me a week ago that you possessed all this information that I have been aching to get hold of."

Thus adjured, Mr. Boggs entered upon his story. From which it appeared that he knew the Ferns, root and branch, and had dined with them dozens of times.

"What sort of a chap is the pater?" asked Weil.

"A very well-kept man of nearly seventy, with a great deal of what is called 'breeding' in his manner, and a face like the portrait of a French marquis cut out of a seventeenth century frame. He doesn't look like a business man at all, and between ourselves he's not

much of a one. All the money he ever made--saving my apparent egotism--was when I was in the concern. I've heard he's got a big mortgage on his residence and is going down hill generally. Too bad; nice fellow; sorry for him; such is life."

Archie asked if Boggs would do him a personal and particular favor, if it would not cause him much trouble; and on being answered in the affirmative, said he would esteem it a great honor if he could be introduced to Mr. Fern by that gentleman's former business associate.

"I suppose I shall run across him at Midlands, some evening," he said, "and get one of those presentations that are the most aggravating things in the world. I don't want that to happen, and the best way, to use an elegant phrase, is to take the bull by the horns, or in this case, the sheep by the tail. Will you make an accidental call on him to-morrow afternoon and let me be of the party?"

Mr. Boggs responded that he would be delighted. And this matter being settled, all parties could give more direct attention to their lunch than they had been doing for the preceding ten minutes.

"You must have heard of my friend Boggs, in the days when he was a figure on the streets of this town," said Weil, presently, returning to what he knew was the favorite subject of that personage. "You've lived here for twenty years, and of course the name of Walker Boggs is familiar to you."

Mr. Gouger looked a good counterfeit of complete mystification for some seconds, and then a gleam as of sudden recollection shot across his face.

"Certainly, certainly!" he said. "Mr. Boggs was what is popularly known as a lady killer, if I am not mistaken. You got married, did you not, Mr. Boggs, some ten or eleven years ago?"

The party addressed acknowledged the practical correctness of the date.

"Why, it comes back as plain as day," said the critic. "The _Herald_ had a page about you, including your portrait and some verses by a well known poet. It said your marriage had cast a gloom over Manhattan Island and some of the up-river counties."

Mr. Boggs gloomily nodded, to show that the statement was true. Then he touched his most rotund portion with a significant look.

"I'm a widower now," he said, "and nothing but this--_this_--stands in my way. As Shakespeare says, "Tis not as deep as a well, nor as wide as a church door, but--' The ladies never look at me now, and all on account of this d--d flesh, which hangs like a millstone around my neck."

Cutt & Slashem's critic, ignoring the peculiar character of the metaphor used, remarked politely that he thought no lady of sense would put great stress on such an insignificant matter.

"Insignificant!" echoed Boggs. "I'll bet it's fifty inches around, come! And it's not the 'ladies of sense' I'm after. Quite the contrary."

One of Archie Weil's explosive laughs followed this statement, which caused an expression of mild injury to settle over the countenance of Mr. Boggs.

"You're getting on toward forty, and you ought to quit," said Weil. "Confound the women! Let them go."

"That's well enough to talk about," replied Boggs, gruffly. "How would you like to follow your own advice?"

Weil uttered an exclamation.

"I? I have precious little to do with them, I assure you. For a man of my correct habits I have the worst name of any one I know. Everybody insinuates things about me, and they can prove nothing."

"We'll ask Isaac Leveson about that," sneered Boggs. "By-the-way, that wouldn't be a bad place to take young Roseleaf to, when you get to instructing him in earnest. I met the young fellow on the avenue last night and walked around with him for a couple of hours. He's a darling!"

"Roseleaf?" cried both the other gentlemen, in one breath.

"To be sure. How the women stared at him! I couldn't blame them; his waist isn't over thirty, and he's as handsome as--as I was at his age. I told him he could have all the loveliness in New York at his feet, if he liked."

Weil smiled significantly at Gouger.

"What did he reply to that?" he asked.

"Oh, he had an ideal in his head, and none of those we saw quite came up to it; for I did get him to raise his eyes and look at the prettiest ones. I drew out of him slowly that he would have nothing to do with a girl unless she had red hair; that--"

Mr. Weil uttered a laugh so hearty that it attracted the attention of everybody in the room. Mr. Boggs paused to inquire the cause of this outbreak, but Archie assured him that something entirely out of the present discussion had just occurred to him, which was to blame for his impoliteness.

"A girl must have _Titian_ hair," repeated Mr. Boggs, accepting the explanation, "or he would not consider her. He ruled out all the striking blondes and brunettes, saying that he liked only those of a medium shade. We came across one that answered these descriptions, an exquisite little creature who looked as if she would swallow him could she get the chance. And then there came out another idea. He would not think of this fairy because she was so short. 'I want a woman five feet, four inches tall,' he said, as if the article could be made to order, in case the size did not happen to be in stock. Then, would you believe it, he found a girl embracing every attribute he had mentioned. Her hair was just the right shade, her height must have hit the mark exactly, her complexion was medium. But no. She was too heavy. She would weigh a hundred and forty-five, he said, quite twenty pounds too much. If we had found a girl that filled all his description he would have invented something new to bar her out of the race."

Mr. Weil remarked that he was not so sure of Roseleaf's insincerity. He believed the right woman would yet be discovered, and that a case of the most intense affection would then spontaneously develop.

"In fact," he added, "I have the identical creature in mind. It is clear to us--to myself and Mr. Gouger here--that Shirley will never write a thrilling romance till he has fallen wildly, passionately in love."

Mr. Boggs smiled slightly, and then sobered again.

"Shall you have him marry, also?" he inquired, pointedly.

"Why not?"

"Because it will finish him; that's why. The romance in a modern marriage lasts six weeks. At the end of that time he will be useless for literary purposes, or anything else."

Mr. Weil shook his head in opposition to this rash statement.

"My theory is," said he, "that a novelist should know everything. To write of love he should have been in love; to tell of marriage he should have had a wife--a real one, no mere imitation; to talk of fatherhood intelligently he should become a father. How can he know his subjects otherwise?"

The stout man smiled significantly.

"And if he wishes to write of murder, he must kill some one. And if he wants to depict the sensations of a robber he must take a pistol and ask people to stand, on the highway."

"Now you are becoming absurd," said Archie.

"No more than you," said Boggs. "You go too far, and you will find it out. Let your novelist fall in love. That will do him good. But don't let him marry, or you will lose him, mark my word. Let him contemplate matrimony at a distance. Let him reflect on the glory of seeing his children about his knees. So far, so good. But when you have shelved him with a wife of the present era, when you have kept him up nights for a month with a baby that screams--his literary capacity will be gone. Make no mistake!"

Mr. Weil, half convinced, and much surprised to hear such wisdom from this unexpected source, made an effort to maintain his ground.

"Nearly all the modern novelists _are_ married," he remarked.

"Yes, and nice stuff they write, don't they? Namby-pamby, silly-billy stories, misleading in every line! They are the most unsafe pilots on the shores of human life. They start, without exception, from false premises. Their chart is wrong, their compass unreliable, their reckoning ridiculous from beginning to end. Where did you ever see a bit of real life that resembled these abortions? Do lovers usually fall on their knees when they propose? Is the modern girl an idiot, knowing less of the facts of nature than an oyster? Is the conversation between men and women filled exclusively with twaddle? You would think so, from reading these books; and why? They are written by married people, most of them, people who don't dare step over the line of the commonplace any more than a woman would dare order her dressmaker to put pockets in her gown!"

Archie looked at Mr. Gouger, who nodded a partial approval of these statements. Mr. Boggs betook himself with more interest to his chops. And the other two gentlemen, remarking that time pressed, bade him good-by for the day.

"I see you agree with him that I shouldn't marry Roseleaf?" said Archie, with a rising inflection.

"There is certainly point in what he says," replied Mr. Gouger.

"But--confound it! With the boy's disposition, it will be a delicate business," retorted Weil. "I don't know as I can carry him to the point of passionate love for pretty Miss Fern, and then shut off the steam when it suits me."

This matter was discussed for the next ten minutes, as the friends walked along toward the office of Cutt & Slashem.

"I think you are foolish to delay so long introducing him to her," said Gouger, finally. "I don't see that you are making any progress whatever."

"Ah, but I am," replied Weil. "I am making both of them more and more anxious for the meeting. Shirley walks the street feverishly impatient, and I have no doubt mutters her name in his dreams. Millicent talks about her ideal of manly beauty. When they get together failure will be impossible."

Mr. Gouger laughed at the idea that Roseleaf was "feverishly impatient" to meet any girl, and ventured to predict that the young man would have to be put in irons to get him to the residence of the Ferns when the time came; or at least to keep him there.

"Just the point I am working on," replied Weil. "Under ordinary circumstances I would have to handcuff his wrists to mine, but I am making such a strong impression on his imagination that he is crazy to go. And once she gets him under her influence--I tell you, Lawrence, she is no ordinary girl."

"She certainly does not write like one," smiled the critic, "either in her subject or her English. You may make something of him--I rather think you will--but not of her. Her ideas are wild, and her realism a little too pronounced even for the present age."

"She has truth on her side, you admit," said Archie.

"Yes, to a remarkable degree."

"Well, that ought to be something, if Boggs' estimate of the modern liar is correct. Shirley will help her to style, give her his own, if necessary. I am going to land both of these fish, if only to spite you, Lawrence. You tossed them away with that fine contempt of yours, and you will weep hot tears for it before you die."

At the door of Cutt & Slashem's they met the two members of that firm, who paused to say a word to Mr. Gouger. They were anxious for a new book to bring out as soon as possible, and were regretting with him that nothing worth publishing seemed to present itself.

"You may strain matters, it necessary," said Mr. Cutt. "We can't keep up on reprints forever. I hope you made no mistake in rejecting that book of Mrs. Hotbox. I hear it is selling well."

Mr. Gouger's face was, as ever, immovable before his employers.

"What 'Fire and Brimstone?'" he inquired. "The authorities seized the entire edition this morning."

Mr. Cutt looked at Mr. Slashem, with a startled expression.

"In that case, I am glad we escaped it," he said. "We shouldn't like that sort of an affair, of course."

Mr. Weil, who knew both the gentlemen well, inquired what they thought of Mrs. Hotbox's production.

"I have never seen it," said Mr. Slashem.

"Nor I," said Mr. Cutt.

The partners disappeared into the counting-room, where they had an interview with a binder who had offered to do their work at one-tenth of a cent a hundred copies less than the concern with which they were then dealing. Archie said good-by to Gouger, and went off to find Roseleaf, with whom he had engaged to take, later in the day, a ride through the Park.

"How soon am I to see your paragon?" sighed the young man, as they were making the grand round of that famous drive.

"Within a week, I hope. Are you getting uneasy?"

"I am getting lonesome," was the gloomy reply. "And I want to begin work."

"Well, it will soon pass now. To-morrow evening I am to hear another installment of her novel. Two more sittings after that will finish it, I should say. And the next thing will be--you. But have you seen no one else in all this time that you care for?"

The young man looked aimlessly at the fleecy clouds that hung low on the horizon.

"No," he answered.

"And you think you are ready for a passionate affection, if the right person is found?"

"I will try," he said, simply.

Mr. Weil roused himself and touched his horse with the whip.

"Try!" he echoed. "You will not have to try. She will carry you off your feet, at the first go. Shirley, I have found you a superb woman, that you _must_ love. All I want to feel sure of is, that you can control yourself enough to behave in a reasonable manner."

Roseleaf looked up inquiringly.

"She belongs to an eminently respectable family," explained Archie. "Her father is a gentleman of the most honorable type. She has a young sister, who--"

Roseleaf, slow at all times, had at last begun to comprehend.

"You surely don't think--" he began.

"Ah, that is the question! A novelist must learn so very much--a novelist who is to depict the truth, as you are to do. Where should he stop? What experience should he refuse, provided it may be utilized in his work? A responsibility that is no light one will rest on me, my dear boy, when I have introduced you to this family, and left you to your own devices."

Roseleaf's eyes opened wider at these mysterious suggestions, but he did not like to make any more inquiries. Weil changed the conversation, calling attention to the women they met, who turned their handsome heads to look at the young man, as their equipages almost touched his.

"What an awfully wide swath you are cutting!" was Archie's exclamation, as the throng increased.

CHAPTER VII.

A DINNER AT MIDLANDS.

True to his appointment Walker Boggs met Mr. Weil on the following afternoon, and set out with him for Wilton Fern's office. Though engaged, as has been already stated, in the wool trade, Mr. Fern did not have on the premises to which these worthies repaired a very large assortment of that product. His warehouses were in another part of the city, and all the wool that was visible to his customers was arranged in sample lots that would easily have gone into a barrel. Mr. Weil, notwithstanding the description that Boggs had given of his ex-partner, was not prepared to see such an exceedingly fine specimen of humanity as the one introduced to him. The word "gentleman" was written in large characters on his broad forehead and in every word he spoke. It certainly was

not often, said Archie to himself, that one encountered that sort of man in business.

"I have already heard something of you, sir," said Mr. Fern, affably, but with the dignity that was a part of his nature, no more to be discarded than his eyes. "That is, if you are the same gentleman that has kindly offered to assist my daughter in arranging a story she has written."

Mr. Weil admitted the correctness of the supposition, but disclaimed any special credit for what he had done. He explained briefly how he was drawn into the case. The visit lasted upwards of an hour, during which the conversation wandered from literature to business and politics, and all sorts of things.

Mr. Weil could not tell from Mr. Fern's manner of alluding to his daughter's work whether he had a very high idea of its value or not. Indeed, there was very little to be learned from this grave gentleman that was not expressed in the language he used. He was inclined, Archie thought, to reticence, for when there was a lull in the conversation it was always one of the others who had to start it going. The thing that might be counted a substantial gain, out of the whole affair, was an invitation to dinner for the following Wednesday, in which Mr. Roseleaf was included, and Mr. Boggs also.

Before the Wednesday set for the formal dinner at the Ferns', Mr. Weil had heard the whole of Miss Millicent's novel read by the lips of that charming young woman. There was certainly something very strong in it, in spite of its grammatical faults. It would be a very good story when "Dr." Roseleaf had put it into a little better English.

The meeting between Roseleaf and Millicent was most interesting to the one who had been the means of bringing them together. The girl put out her hand with a straightforward motion of welcome, and it was accepted with something resembling timidity by the young man, who did not even raise his eyes to hers. The talk that followed was nearly all her own, Shirley's part in it being largely monosyllabic replies to her statements and suggestions.

When Miss Daisy was presented to both the gentlemen, for the first time--Mr. Boggs she remembered very well--she drew their attention for a few moments from her sister, but soon relapsed into the more insignificant place which she seemed to prefer. She was not as large in any way, as Millicent, and did not seem likely to become so. Her hair was of a soft shade of light brown, and her eyes a decided blue. In the presence of her sister she did not expect to shine, and was evidently relieved when she could go into a corner and talk over times long past with Walker Boggs.

Mr. Fern came in rather late, but still before the hour announced for dinner. He had his habitual look of quiet elegance, but withal an expression of care about his face, that Weil attributed to the business troubles of which Boggs had spoken. The manner of the daughters toward him was marked by the watchful eyes of the chief conspirator. Millicent merely looked up and said, "Papa, this is Mr. Roseleaf, of whom we have spoken," and then when the greetings that followed were exchanged, went on talking with those about her as if there had been no interruption. Daisy, on the other hand, crept softly to her father's side, and putting an arm around his neck, kissed him when she thought no one observed her.

"You are tired, papa," she whispered.

"No, no!" he said, brightening. "I am very well."

It was at the table that Mr. Fern had his first conversation with Roseleaf, and the two men got along nicely together. Shirley acquitted himself creditably. Weil, who saw everything, noticed that the negro, Hannibal, in superintending the service in the dining-room, lingered more about Miss Daisy's chair than any other, and took extra pains to see that her wants were anticipated. In spite of this, however, Mr. Fern frequently asked his younger daughter to have more of certain dishes, as if his mind was constantly turned in that direction.

"How long do you think it will require to do the work you have so generously undertaken?" asked Mr. Fern of Roseleaf, when the dessert was reached.

"It is impossible to say," stammered the young man. "Some weeks, at least."

"So I supposed," said Mr. Fern. "That being the case I wish to tender you the hospitality of my home. It would be a great deal of trouble for you to come every day from the city, and I know we could make you comfortable here."

Roseleaf was about to decline the offer with thanks, when Mr. Weil spoke to him in a low tone.

"Take it, by all means," he said. "It's a chance in a lifetime. You know nothing of family life. Don't dream of refusing."

The delay allowed Miss Millicent to add her request to that of her father, and fearing to let his protege answer, Mr. Weil boldly spoke for him.

"It is a good idea," he said. "He will have his baggage brought up to-morrow. There's nothing like being on the ground, when there's work to be done. And, with the general permission, I am going to run out pretty often myself, to see how things progress."

The bright, off-hand way of the last speaker seemed to please Mr. Fern, for he heartily seconded this suggestion. When the table was vacated, Mr. Fern asked if he might be excused for a few minutes, while he wrote a couple of important letters, and requested Walker Boggs to show the guests through the grounds, where they could smoke their cigars till he returned.

Accordingly Weil and Roseleaf accompanied their new guide out of doors and across an extensive lawn to an arbor at the further end, where a handsome prospect of the Hudson unfolded itself. As Archie was wishing for some feasible way of getting rid of Boggs, temporarily, that gentleman espied an acquaintance in the adjacent road and went off to speak to him.

"Are you in love yet, you dog?" asked Archie, as soon as he and his young friend were alone. "What! You're not! Don't let an hour pass, then, before you are. The best of all proverbs is, 'Never put off till to-morrow what you can do to-day.'"

"How can I do this to-day?" was the doleful response.

"How can you help it, you mean? There she was at the table--Titian hair, hazel-grey eyes, lovely waist--everything. Love! _I_ could fall in love with that girl, marry her, get a divorce and commit suicide, within forty-eight hours."

Even Roseleaf had to smile at this extravagant statement.

"Do you want me to do all of those things?" he asked.

"Only the first one, at present. If you can't do that, give up all ideas of being a novelist and secure a place in some factory or counting-room. Everything is ready for you. You are _persona grata_ here. Nothing can come in your way. Oh, don't exasperate me!"

Roseleaf haltingly said he would do his best; and the next day he came to Midlands, prepared to spend a month or longer.

CHAPTER VIII.

HOLDING HER HAND.

For the first three days Roseleaf gave most of his time to reading the MSS. that Miss Fern had written. He could not say that he liked it, exactly, but that was not necessary. To fill in the time, he consented to let the girl read his own story that Gouger had rejected, though he did this with trepidation, having a dread that she would think it insipid. When she had finished it, however, her delight was unbounded.

"It is lovely!" she exclaimed, in response to his inquiring eyes. "I cannot see why they refused it. I haven't been so interested in a story in years."

When he had read _her_ story through he began to rewrite it, departing as little as possible from the original. As soon as he had a chapter finished he would give it to her, for comparison, and criticism, if she chose to make any. She proved, however, a most charming critic, her shafts falling mainly upon herself, for she declared that her novel seemed unworthy of its elegant new dress. She conceived a shyness toward this quiet youth, and blushed when the striking situations and bold language of her tale came into the conversation. It was so different from his own work!

"It is too bold. I am sure it is," she said, repeatedly. "I ought to begin again. My plot has too much freedom, too little conventionality. People will say a very strange girl must have written it."

And he would tell her that he did not think so; that the strength of her ideas was very great, and that the public would find excuses enough for anything that interested and entertained it. He even added that he wished he possessed her knowledge, her insight into life, her fearlessness to tread on any ground that her subject made desirable.

Between them they were doing very good work, without doubt. Mr. Weil took some of the completed chapters to Lawrence Gouger, who returned them with a smile that spoke volumes. Cutt & Slashem would take the story when it was ready, if the subsequent pages kept up to the mark of the first ones.

"Don't forget your own book," said Gouger, in a note he enclosed for Roseleaf.

Mr. Weil was not backward in accepting the cordial invitation he had had to join the Ferns at dinner whenever he could make it convenient. Besides this he called frequently at the wool office, and ingratiated himself into Mr. Fern's good graces in many ways. Within a fortnight he knew all there was to be known about wool, in which he seemed to have conceived a great interest. In his talks with Roseleaf he spoke learnedly on this subject, referring to the foreign and domestic staples, like one who had made the matter a life study.

"What a queer thing trade is!" he exclaimed, on one of these occasions. "Here we find a man who ought to adorn an atelier, or a seat in Congress, and yet is obliged to guide his entire existence by the price of such a confoundedly dull thing as the hair on a sheep's back. He votes a certain political ticket on account of the attitude of the party on Wool; he dines off mutton and lambs' tongues; he casts his lot with the Sheep at church. I don't know but he would feel a genuine pleasure in having Wool pulled over his eyes. And still I am convinced that he never ought to have been in the Wool business at all, and that Boggs--what a drop--is right in his impression that it will eventually swamp him."

Roseleaf asked how Mr. Fern got into the trade in the first place.

"Well, as I understand it, Boggs was looking for a partner. Mrs. Fern had some cash and her husband wanted to put it into a good thing, from a financial standpoint. They did well while they were together. When Boggs pulled out they had a clear $200,000 apiece. Boggs--confound him!--has his yet; Fern hasn't. He's proud as the devil, and didn't tell me this, by any means. It would break him up completely to have to go into bankruptcy. Really, I wish I could do something for him."

Roseleaf looked up inquiringly.

"Why, I've got a fair amount of money," explained Archie, "and perhaps a lift over these hard times might be the making of him. I'm not particularly a philanthropist, but I like this fellow wonderfully well for such a new acquaintance. I shall give him a delicate hint in a day or two, and if I can fix things without too much risk--we have to protect ourselves, you know--I am willing to do so."

This struck Shirley Roseleaf as rather odd. He had never thought about Mr. Weil in that way. Whether he was rich or poor had never entered his head. He began to wonder if he was very wealthy. He certainly lived well, and had no visible occupation of the sort the census takers call "gainful."

"It is an interesting family, though," pursued Archie, in his rambling way. "I wish I could get into it as you did, you rascal, and observe it at shorter range. Even the servants are worth studying. Look at that Hannibal; who can say that the African race is inferior when it produces such marvels! I can hardly take my eyes off the black paragon when he is present. How he passes the soup--as if it were some heavenly decoction, made by the gods themselves and sent to earth by their favorite messenger! With what grace he opens the carriage door! with what majesty he mounts to his seat by the driver! I wonder if he has a sister. She would be worth a journey to see. I have met such women on their native soil, statuesque, slender, full-breasted, square-shouldered, with jars of water on their heads and clinking silver anklets. What a cursed thing is our American prejudice against color! No other people carries it to such an extent. In the Latin Quarter the West India blacks are prime favorites with the pretty grisettes."

The young man could not help a slight shiver at this information. He did not in the least agree with the sentiments his friend was advancing, but neither did he think it wise to contradict him.

"Then there is the little one--Miss Daisy"--continued Weil, branching suddenly into that topic. "So quiet, so self-abased, as if she would not for the world attract one glance that might be claimed by her elder sister, who is perfectly willing to be a monopolist of attention. A nice girl, sweet as a fresh-plucked lily. There must be treasures hidden under all that reticence. Still waters run deep, the silent swine devour the milk. I think I ought to investigate the child. If you are to have that aggregation of beauty known as Millicent, what prevents me from securing a slight hold in the affections of the junior?"

Roseleaf shook his head in a way that might have meant almost anything. He never could tell how much in earnest his friend was when he took up a vein like this. Neither could he imagine little Daisy in the role of an entertainer for such a very wise man as Archie, not only much her senior but a thousand times her superior in knowledge and acquaintance with things that people talk

about.

"Keep your eye on her--she will be worth watching," said Weil, with one of his laughs at the sober face before him. "She is worth almost as much to a rising author as the negro--not quite, but nearly. Then there is the pater-familias; is there anything in him? No, he will be of no service to you. And that brings us back to our superb Millicent, with whom you must now be wildly infatuated."

Roseleaf shook his head again.

"No--not yet," he said.

"But, what do you do all the time? How can you sit by the side of a pretty girl, and kiss her cheeks, and put your arm around her, and yet keep from falling in love?"

The younger man gasped at each of these suggestions, like one who has stepped into icy water and feels it gradually creeping upward.

"I have done none of those things," he faltered.

"None of them! Then I shall not let you stay here!" cried Archie. "What does the girl expect? That we are going to make her reputation in the literary world and get nothing for ourselves? I never heard such effrontery! She refuses to give you the least opportunity, does she--the jade!"

More and more confused grew the other at these expressions.

"You don't understand--you are quite in error," he articulated. "She--she has refused me nothing, because--because I have asked nothing."

Mr. Weil uttered a disheartened groan.

"But this will not do, my dear fellow!" he said. "How can you accomplish anything unless you make a beginning? Rewriting the story that she has written will not advance you one step on the path you profess such anxiety to tread. That is only an excuse--a make-believe--a pretence under which you have been given quarters in this house and allowed every chance in creation to learn your lesson. Are you afraid of her, or what is the matter? Does she overpower you with her beauty? Tell me where your difficulty lies."

But Shirley could hardly answer these apparently simple questions. He said he feared the trouble might be in the formality of the situation. How could Mr. Weil expect, he asked, that a spontaneous case of love-making would develop from such a condition of things.

"Stuff!" cried Archie, with a grimace. "If you and she were members of a theatrical company, and were cast as a pair of lovers, you wouldn't find so many pitfalls. You would go ahead and repeat the lines of your part, wouldn't you? All you want is to do the same now."

"But what _are_ the 'lines of my part?'" inquired the other, dolefully.

"Take her hand once in yours and they will come to you," retorted Weil.

Roseleaf reddened so much that Archie regretted the severity of his tone, and hastened to turn the conversation to something more agreeable. He made up his mind, however, to have a talk with Miss Fern, and at the first opportunity he did so. It was on an afternoon when he knew Roseleaf was in the city, and he came to the point at once, after his own fashion.

"How are you and my young friend getting along?" he asked her.

"Oh, as well as possible," she responded. "I am learning to like him more and more. I really shall be sorry when his task is done."

Mr. Weil shrugged his shoulders.

"There's a bit of selfishness in your words, Miss Fern," he said. "Have you forgotten that he is not here to be useful to _you_ alone; that you agreed to do what you could for _him_, as well?"

The girl cast down her pretty eyes in confusion.

"I am sure I have tried to be agreeable," she replied, gently.

"That is not enough," replied Archie, gravely. "What he needs is something--some one--to stir his blood, to awaken his fancy. I told you in the first place that you ought to make him fall in love with you--for literary reasons. He must feel a sensation stronger than mere friendship for a woman before he can write such a story as will bring him fame."

Miss Millicent did not grow more comfortable under this suggestion. She remarked, after a long wait, that she did not see how the end sought was to be accomplished. Love, she said, was not a mere expression, it was a deep, actual entity. Two people, playing at love with each other, might afterwards find that they were experimenting with fire.

"I have heard," she continued, her fair cheeks growing crimson, "that there are women--"

Then she paused and could go no further. But he understood.

"There are women--thousands of them," he admitted, "who would willingly do what I ask. If it is necessary, he must go to them."

She wanted to say that she hoped it would not come to that--she wanted to convey to her companion the horror she felt for what she supposed his words implied--but she could not. It was so much easier to write of things than to talk of them to a man like him.

"Do you call it quite fair," he asked, "to claim all and give nothing? He does not require much. Could you not let him take your hand, and--"

"And--"

"Possibly, touch your lips with his?"

Miss Fern rose to her feet with a fierce gesture.

"Sir!" she exclaimed.

"Very well," replied Mr. Weil, shortly, turning away.

The girl resumed her seat, with rapidly rising and falling bosom. She was in a quandary. The suggestion she had heard would have sounded from any other lips like a premeditated insult. Coming from this man the venom seemed to have vanished.

Roseleaf felt somewhat discouraged after his latest talk with Weil. He wanted to make a start, to do something, no matter how little, toward the object he fully believed was to be attained. That evening while walking with Miss Fern (for it was their frequent habit to go out of doors unchaperoned) he found himself unconsciously taking her hand--that hand for which he had until now felt a genuine fright. And she, after all her resolutions never to permit anything of the sort, gave it to him, as they strolled together along an unfrequented byway.

"I want so much to make a Name," he was saying fervently. "I have tried and tried to begin such a book as Mr. Gouger wants, but I cannot. Won't you help me, dear Miss Fern? Won't you show me what I lack? I know you can, if you will. They tell me I have had no experiences, and that I must have--not a real affair, you know, but an inkling of what it is like. I have tried to say things to you and have been in fear that you would not like them, and have held my peace. But now, I can wait no longer."

In his exuberance Roseleaf spoke at last with ardor, and even went so far as to attempt to put one of his arms around the waist of the fair creature by his side. On her part Miss Fern was nearly overcome by surprise.

In one instant the timid young gentleman had changed into the similitude of a most ardent swain; but in the next he became again his natural self, with the added confusion resulting from his excited and mortified state.

"Let me take you home," he said, when he saw that she could find no words even to chide him. "Let me take you home; and to-morrow I will go away."

Go away! She did not like that idea! Her book was not yet finished, for one thing; and besides he was a nice young fellow, and had meant no offense.

"There is no reason why you should go," she stammered. "I forgive you, I am sure."

"Do you!" cried Roseleaf, grasping her hand again in his joy. "You are kindness itself to say so. I must appear very stupid" (here he half put his arm around her again, checking himself with difficulty from completeing the movement) "and dull, and wanting in manners, but you are the only young lady I have ever known on terms of the least intimacy."

Miss Fern replied that she did not mind what had occurred, and hoped he would forget it. She added that she would do anything she could for him, and had the most earnest wish that they should be friends.

At the gate they paused, and in some way their eyes were looking into each other. The girl laughed, a relief to feelings that had been for the past ten minutes somewhat overcharged.

"Well, you have made a beginning," she said, mischievously, for she wanted to drive the sober expression from his clouded face.

"A beginning?" he echoed.

"Yes," she said. "You have held my hand."

He crimsoned.

"You said you would forgive me," he murmured.

"With all my heart," she responded, putting the hand in his again.

He felt a thrill go through him, but it was a pleasant sensation.

"I came very near putting my arm around you," said he, looking away from her. "Do you forgive that, too?"

She took the hand away and struck him playfully on the cheek with the palm of it.

Then, before he surmised what she intended, she ran brightly up the steps of the house and vanished.

CHAPTER IX.

"DAISY, MY DARLING!"

It was Roseleaf's full intention to say something about this adventure to his instructor in the art of love, Mr. Archie Weil, but somehow he was not able to summon the requisite courage. He had a delicate sense that such a thing ought not to be repeated, where it might by any possibility bring a laugh. And about this time the novelist's attention began to be attracted toward the younger sister, who had till then almost entirely escaped his observation.

He noticed particularly the ceaseless devotion that the black servant of the family exhibited toward her. She might have been a goddess and he a devotee; a queen and he her slave. Hannibal moved about the girl like her very shadow, ready to anticipate her slightest wants, while Daisy seemed to take this excess of attention as a matter of course.

Millicent constantly showed her dislike for the servant.

"I don't see how you can endure to have him touch you," she said to Daisy. "He knows better than to lay his hands on me. I have told papa often that I want him discharged, and he ought to consider my wishes a little."

To this Daisy answered that the boy, as she persisted in calling the giant, meant well and was certainly intelligent. Her father did not like to change servants, for it took him a long time to get used to new ones. So Millicent tossed her head, returned to her collaboration with Mr. Roseleaf, and things went on as usual.

Imperceptibly Shirley began to take an interest in Daisy. She did not run away from him, and he discovered, much to his surprise, that she was worth talking to. She was not exactly the child he had supposed, and she had the full value of her eighteen years in her pretty head. He got into the habit of taking short strolls with her, on evenings when Millicent was occupied with Archie, and when, as often happened, Mr. Fern was away with Hannibal in the city. There was a sequestered nook at the far end of the lawn, in which the pair found retreat. Before he realized it, Roseleaf had developed a genuine liking for these rambles, and was pleased when the evenings came that brought Mr. Weil to dinner.

Daisy was ingenuous, to a degree, if surface indications counted for anything. The words that flowed from her red lips were as unstudied as the pretty attitudes she assumed, or the exceedingly plain but very becoming dresses that she wore. After she once got "used" to Roseleaf she treated him quite as if she had been five years his senior.

"Are you a rich man?" she asked him, on one of those early autumn evenings that they passed together.

Her manner was as simple as if she had said that it looked like rain, and his answer was hardly less so.

"No, Daisy. I have not much property, but I intend to earn more, by-and-by. Did you think, because I seem so idle, that I was a millionaire?"

"No," she answered, a shade of disappointment in her face. "I only wanted, in case you had plenty of money, to get you to lend me some."

He stared at her through the half-light. Her features were turned in a direction that did not reveal them very well. What did she want of money!

"How much do you need?" he inquired, wondering if it was within his power to oblige her.

"Oh, too much, I am afraid. And I cannot answer any questions, because the object I have is a secret. I don't think my plan very feasible, for it might be years and years before I could pay it back. You won't mind my speaking of it, will you?"

Curiosity grew stronger, and as politely as possible he renewed his question as to how much the girl needed to carry out her plan.

"I don't know, exactly," she said, thoughtfully. "Perhaps a thousand dollars a year for five or six years; it might take less."

"It is a great deal," he admitted. "Does your father know what you contemplate?"

The girl changed color at once.

"Oh, no. I should not like to have him, either. He would say it was very foolish. And yet I am sure it would not be. The money would do much good--yes, ever so much."

The young man thought hard for a few moments. A desire to see a brighter light flash into those young eyes possessed him. He debated seriously the idea of handing her his patrimony, as he would have given her a pound of candy if she had wanted it.

"I might give you part," he said, after a pause. "Perhaps your thousand for the first year or two."

She looked him full in the face, and put both her hands in his impulsively.

"You are too good," she exclaimed, with fervor. "But you cannot afford so large a gift. No, I would only take it if you had a very large sum, and could not possibly miss it. I asked carelessly. I should not have done so--I was selfish to think of such a thing."

"I want to speak to you about something, also," said Roseleaf, after a strained pause. "I have noticed of late that your father has some trouble on his mind."

She started suddenly.

"Ah!" was all she said.

"And I have wondered if there was anything I could do to--to aid _him_--to relieve him. Because, I would like it very much if I could, on account of--of--"

She looked up inquiringly.

"I have been so much a member of your family, in a certain way, that a grief like this appeals strongly to me," he said, haltingly.

She paled slightly as she repeated his words.

"A grief?"

"Well, distress, annoyance, whatever it may be called. If there is anything I can do, I shall be more than happy."

The girl sat for some moments with her eyes on the ground.

"He _is_ troubled," she said, finally. "I am glad to talk with you, for I cannot get him to tell me anything. He is greatly troubled, and I am worried beyond expression. I can't understand it. He has always confided in me so thoroughly, but now he shakes his head and says it is nothing, trying to look brighter even when the tears are almost ready to fall. What can it be, Mr. Roseleaf? He has no companions outside of his office and this house? He sits by himself, and isn't a bit like he used to be and every day I think he grows worse."

Roseleaf asked if Daisy had talked much with her sister about it.

"No," she said, with a headshake. "I don't believe Millie has noticed anything. She is so occupied with her literary matters"--there was a sarcastic touch upon the word, that did not escape the listener--"she has no time for such things. I hope you won't think I mean to criticise her," added the young girl, with a blush. "I know you care a great deal for my sister, and--"

She stopped in the midst of the sentence, leaving it unfinished. And Roseleaf thought how interesting this girl had become.

"Let me confide in you, Daisy," he said, in his softest tone. "I do not care 'a great deal,' nor even a very little for your sister. You see," he went on, in response to the startled look that greeted him, "I am to be a novelist. To be successful in writing fiction, I have been told that I ought to be in love--just once--myself. And I came here and tried very hard to fall in love with Miss Millicent; and I simply cannot."

Daisy's fresh young laugh rang out on the air of the evening.

"Poor man!" she cried, with mock pity. "And hasn't she tried to help you?"

"No. She hasn't. And as soon as I get the work done I have commenced for her, I am going away."

The child--she was scarcely more than that--grew whiter, but the shadows of the evening hid the fact from her companion.

"You ought not to go," she said, slowly, and rather faintly, "until you have made another trial."

"Oh! It is useless!" he replied.

"Is it that you cannot love--Millie--or that you cannot love--any one?"

He hesitated, puzzled, himself, at the question.

"I never did love any one--any woman," he confessed, "and perhaps I never shall. But your sister seems peculiarly hard to love. Yet she is a very handsome girl and equipped with a mind of unusual calibre."

Daisy acknowledged this description of her sister's charms. She remarked that it was strange that such a combination did not suffice to accomplish the desired result.

"There are people who do find her entertaining," she added. "Mr. Weil is one of them."

"Oh, Archie!" said Roseleaf. "He finds everything entertaining. It is nothing worth remarking. She is the exact description of his ideal in feminine face and form. He once gave me the list of the excellencies of a 'perfect woman,' and your sister has them all."

The younger Miss Fern had her own opinions about this matter. She thought the innocent man at her side had not quite gauged the interest that Mr. Weil took in her family.

"I will make a proposition," she said, with a light laugh, when they had talked longer upon the subject. "I am afraid it won't seem worth much to you, and perhaps you can do better; but why can't you stay here, and--if Millie won't do--make love to _me_?"

Darkness is responsible for many things. In the light, Daisy could not have uttered those words, even in jest. There, when the sun had set and the stars were not yet on duty, she found the courage to make that suggestion.

"You are very kind," he stammered, when he grasped her meaning. "But I do not think it will answer. I am afraid love cannot be pushed to any point without its own initiative."

"That is probably the case with _real_ love," replied the girl, "but an imitation that would serve your purpose might be evolved in the way I have indicated. For instance, you could take my hand in yours--like this--and I could lean toward you in--this way. And then, if you had sufficient courage--"

Before he dreamed of doing it, it was done! He had kissed her on her tempting lips, placed within an inch of his own.

"You are too good a scholar," she pouted, rising to her feet in some confusion. "I did not give you leave to do that."

"I beg your pardon most humbly," he answered, with intense contrition. "May I assure you that the act was wholly involuntary and that I am very sorry for it?"

She turned and surveyed him in the shadow.

"Are--you--_very_--sorry?" she repeated.

"Yes."

"Why?"

"Because I have made you angry."

"Do I seem angry?"

"At least, I have injured your feelings."

Her face was close to his again.

"Well, I forgive you. There, let us make up."

She raised herself on the tips of her toes and kissed him twice.

All the blood in this young man's body seemed to rush to his head and then back with violence to his heart.

"_Daisy!_" he stammered. "_Daisy!_"

But she sprang away as he tried to embrace her, and standing two yards off, tauntingly cried that he did not know what love was, and that no one could ever teach him. Taking up the challenge he started toward her. She ran away, he in pursuit. She had gone but a few steps when she tripped over an object in the path and went down. In trying to stop himself Roseleaf fell by her side.

"Daisy!" he cried. "Are you injured?"

She did not answer. In the darkness he saw her lying there so still that he was frightened. He caught her passionately in his arms, and knew no better way to bring her to consciousness than to rain kisses on her cheeks. As might be expected this only served to prolong her swoon, which was not a very genuine one, if the truth must be told, and it was some seconds before she opened her eyes and caught him, as one might say, in the act.

"How dare you!" she demanded, shrinking away from him.

"Daisy, my darling!" he answered, his voice tremulous. "I thought you were dead, and I knew for the first time how dearly, how truly I loved you!"

She laughed, not very heartily. She had hurt herself truly in her fall, and her feminine nerves were jarred.

"You are doing nicely," she said. "For a beginner, one could ask nothing better. And now, if you will help to rise, I think it would be more proper."

"No." He spoke with force and passion. "You must not think I am trifling. _I love you!_ Yes, I love you! _I worship you!_"

"I do not see," she remarked, insisting in spite of him that she must assume a standing position, "how you differ in your expressions from the lovers I have read of in novels. It is quite time that we returned to the house. To-morrow, if you like, I will give you another lesson."

Shirley was a picture of utter despair. His new sensations almost overwhelmed him. In one second the dead arteries in his body had leaped into the fullest life. The touch of that young maiden's lips had galvanized him. He could not bear to leave her with those mocking words. But at that moment a voice was heard in the direction of the residence.

"Miss--Dai-sy! Miss--Dai-sy!"

It was Hannibal, who had returned from a drive with Mr. Fern. They could see him dimly coming across the lawn with the girl's cloak in his hand. Daisy, with one quick grasp of the fingers that hung close to hers, said good-night to her companion, and started in the direction of the servant. If she intended--as seemed probable--to pretend she was out alone, Roseleaf did not mean to share in that deception, and he followed close behind her.

"Here I am, Hannibal," called Daisy. "Ah, you have my coat. It was very kind of you. Has papa come home? I am coming in. I did not think how late it was."

The negro stopped as he saw the strollers, and knew that they had undoubtedly been together. What more he suspected no one can say with certainty. But he threw the cloak upon the grass that bordered the pathway and turned on his heel without a word.

"Confound his impudence!" exclaimed Roseleaf, when he had recovered sufficiently from his surprise to speak. "I have a good notion to follow him and box his ears."

The soft hand of the girl was on his sleeve in a moment.

"Say nothing to him--_please!_" she answered. "He--he is very thoughtful for me--of my health--and I was careless. Papa must have sent him."

The touch on his arm mollified the young man at once. He tried to make out the lines of the pretty face that was so near him and yet so far away.

"We are to study again to-morrow, then," he said, taking up her statement with an assumed air of gayety. "At what hour?"

But she broke away from him abruptly, and ran into the house without a word. Hannibal stood in the doorway and Roseleaf thought he distinguished harsh sounds from the negro's lips; but this seemed so incredible that he conceived his senses at fault.

Looking at his watch the novelist saw that it was still early enough to take a stroll by himself and ponder over his new happiness--or misery, which was it?--under the open sky. It was two hours later that his latchkey turned in the door, and in that time he had resolved either to make Daisy Fern his wife or commit suicide in the most expeditious fashion.

CHAPTER X

"OH, SO MANY, MANY MAIDS!"

The only disagreeable thing about falling in love with Daisy was that Roseleaf felt compelled to reveal the truth to Archie Weil. He believed he was bound to do this by a solemn contract which he had no moral right to ignore. Perhaps Weil might claim that he had no business to fall in love with one sister when his "manager" had picked out the other for this operation. Be that as it may, there was no use in evading the question. It must be talked over, be the result what it might.

"Well, I know what love is now," was the abrupt way in which the young man opened the subject on the following afternoon.

He had ridden to the city, as Weil was not expected at the residence of Mr. Fern that day. The hope he had formed the previous evening of getting another interview with Daisy had not materialized, she having gone on some short journey before he could intercept her.

"You do!" was the equally abrupt reply, uttered in a tone that betrayed undoubted astonishment. "What do you mean?"

Roseleaf reddened.

"It came to me all at once, last evening," he said, avoiding the gaze of his companion. "We were down at the end of the lawn, you know--"

Archie interrupted him with a sudden shout.

"Not _Daisy_!"

"Yes."

"You are in love with _Daisy_!"

Roseleaf bowed.

"Upon my word!"

There was nothing in any of these expressions that conveyed the information which the younger man craved, namely, whether his friend approved what he had announced, but he stole a look at him and saw that he appeared more astounded than angry.

"You dear boy," he said, "I don't know what to say to you. You blush like a maiden over the acknowledgment. I am half inclined to believe you are the girl in the case, and your partner in love some great, strapping fellow on whose bosom you intend to pillow your coy head. So it is Daisy, eh? And last night it came to you? Tell me how it happened."

Comforted in a measure by the good nature of his friend, Roseleaf proceeded to give the outlines of what had occurred, suppressing the more intimate facts with which the luckier reader is acquainted. He admitted the touch of hands, but did not mention the pressure of lips to lips. He told of the girl's swoon, but said nothing of the extraordinary measures adopted to bring her to her senses. But, while he made no insinuations, nor pretended to see through the meshes in this net, the experience of Mr. Weil served him in good stead. He could fill in the vacant places in the story with substantial correctness.

"I don't know what Miss Millicent will say to all this," he remarked, when the recital came to a pause.

"I think she was just beginning to like you a little herself. Most of our talk last evening was about you, and when I mentioned, as I took my leave, that you were probably out walking with Daisy, I could see distinct traces of jealousy. I want to be fair with my client. I told her that you came there to learn love from her, not from her little sister. If all this should result in breaking her heart, I don't see how I could excuse myself. And the other one, she seems such a child, I never thought of her in that connection. Why, how old is she--not over eighteen, I think."

Roseleaf answered that Daisy would be nineteen on her next birthday, an ingenious way of stating age that was not original with him.

"All right," said Archie, digesting this statement slowly. "And now, what is your programme?"

Roseleaf looked surprised at the business-like nature of the question.

"I mean to secure her consent to marry me, as soon as possible," he said.

"And then?"

"Why, see her father, I suppose. Isn't that the most important thing to do?"

Mr. Weil shook his head decidedly.

"Not by any means. You must not act with undue haste. Mr. Fern would say she was too young to think of matrimony, a proposition you could not successfully dispute. Besides, should he happen to give his consent and appoint a week from Wednesday for the happy occasion, see what a mess it would put you in."

The suggestion caused the brightest of smiles to illumine the countenance of the listener.

"It would make me the happiest of mortals!" he cried. "There is nothing that could prevent my summoning the clergyman and securing the prize I desire."

Mr. Weil grunted.

"H--m! And in the meanwhile what would become of your great novel?"

This question brought a sober pause to the young novelist.

"I could write it after my wedding," he answered, finally.

"Could you? You could write nothing at all then--nothing that any one would pay a cent to read. I have told you from the start that what you want is a _grande passion_, something to stir your soul to its depths. You are on the verge of that experience. Already you have had a glimpse of what it will be like. For the first time the touch of a woman's fingers has driven sleep from your eyelids. No, you didn't tell me you laid awake all night, but I saw it by looking at you. You can shut yourself up in your room now, and rhapsodize over the dear face, the lovely mouth, the soft voice of your beloved. In another week, if this keeps on, you can write like a combination of George Eliot (after she met Lewes) and Amelie Rives (before her marriage). A month later, Gouger might rave over your productions, for you will be on the Matterhorn of bliss unsatisfied."

A slight laugh, at his own excess of description, issued from the lips of Mr. Weil, but the countenance of his companion was as firm as a rock.

"You are right," said Roseleaf, gravely. "Already I see the vast difference between this sensation of love and the thing I imagined it to be when I wrote those silly pages that Cutt & Slashem did so well to reject. But I am torn between two desires. I want to write my novel--until yesterday I thought no wish could be so great. And I also want my wife." He breathed the word with a simple reverence that affected even the flinty heart of his hearer. "I shall never rest easy until I find her wholly mine, to love, honor and cherish while God gives me breath!"

The hand of the elder man dropped heavily on the table by his side.

"_Good!_" he exclaimed. "_Very_ good! You could not have said it better. There is an opportunity before you to accomplish both of these things. I only wish to impress upon you the fact that they must come in the order I have indicated, or one of them will never come at all. Write your story while the fever of passion is on you. The dead calm of married life would only bring the sort of novel that the shelves are already piled with, nauseating to the public and a drug in the hands of the publishers."

Roseleaf doubted the full correctness of these conclusions. He thought, with that dear girl by his side, he could write with all the fervor of a sweetheart, for his affection was to have no boundary, no limit, no end. But he had a high opinion of the abilities of Mr. Weil, and he had no idea of disputing the conclusions of that wise guide.

"Do you think she will accept me?" he asked, wistfully, returning to the main question. "It came so sudden, and there was very little said, and it was late; and then Hannibal came after her, and she went into the house. Everything was left in a state of uncertainty."

"Did nothing show whether you were indifferent to her?" was the wily interrogation that followed. "Usually I believe something conveys the sweet word 'hope' to the waiting one. And what do you say about Hannibal? That he came to call your charmer and took her away from you?"

Without reserve the young man repeated what had happened. Archie seemed deeply interested, but whatever his thoughts he did not express them at the time.

"And that reminds me of another thing," said Roseleaf. "Have you noticed anything strange about Mr. Fern?"

"Yes," said Mr. Weil, "I have noticed. I wondered if you had done the same. Have you discovered what the trouble is?"

"No, and Daisy doesn't know, either. Indeed, she is much distressed about it. Remember, this is a secret between us, for perhaps I had no right to talk of their affairs. He is in a state of great depression, and as he is so regular in his habits I can't imagine what to lay it to. You are so shrewd, couldn't you find out?"

Mr. Weil rose and took a few paces up and down the room.

"You are the fellow to do that, not I," he said, presently. "Yes, hear me out. You are in a sense a member of his family, and would have a natural right to allude to the state of his health. Then, if you were to put in a word about Miss Daisy--why, you might kill several birds with one stone."

Roseleaf looked much puzzled.

"I thought," he said, "that you wanted me to postpone the matter of my marriage as long as possible."

"Your marriage, yes. But not the preliminaries. They may require a dozen bouts with the old gentleman. The first time he will probably laugh you out of the room as a silly young noodle; the second he will say that he has nothing against you personally, but

that his 'baby' is too infantile to think of such things for ten years yet; the third he will begin to see the situation in its right light, and after that it will be only a matter of detail. All these things will be of the greatest value to you in the novel you are going to write, and you must not on your life miss a single one of them.

"Drop into the wool shop, catch his royal highness there, and for the first thing express solicitude for his health. Unless he is on his guard more than is likely you ought to catch some slight straw to show what ails him. Then follow it up with a word or two about Miss Daisy, and you will have spent a good afternoon, even if he doesn't smile on your suit at first hand, and take you to his manly breast as his long-lost son-in-law."

The reasonings set forth in these propositions were so evidently correct that Roseleaf resolved to adopt them just as soon as he could bring himself into the proper mood. In the meantime, however, he wanted to have a little further talk with Daisy, for he could hardly ask her father for her hand without the semblance of permission on her part. He tried to remember all she had said to him at the foot of the lawn, and was compelled to admit that it was very little indeed. The only things he was certain of were the kisses, but his experiences were so slight that he could not tell how much weight to give even these.

That evening he tried his best to get a word with her alone, but she eluded him, and he was obliged to go to the boudoir of her sister and read over that young lady's MSS. as it stood revised by his careful hands.

"Well, another chapter will finish it," said Miss Fern, when he put down the pages. "And then Mr. Gouger will decide whether Cult & Slashem consider it worth printing."

"Yes," he answered, gravely. "They will print _your_ story now, without doubt. But _I_ am as far as ever from satisfying their requirements."

Millicent thought how supremely selfish she must seem, talking always of her own hopes and doing nothing to help the one who had made her success possible. She saw that he wore a dejected look, and she began to sincerely pity him. When our own ships are safely in sight of the harbor we have more time to dwell on the derelicts in which the property of our friends is embarked.

"Perhaps, when we get this disposed of, I can help you," she suggested.

It was nearly a week before Roseleaf could get another talk with Daisy, a week that tried him to the utmost, for he could think of nothing but her, and could not understand her reasons for treating him so strangely. At last he wrote her a letter, giving it to Hannibal to deliver, in which he said that he was about to return to his city lodging and wanted to know if she meant him to leave without a kind word at parting. He thought the negro looked peculiar as he took the note, half as if he did not intend to accept the commission to deliver it; but he concluded that this must be imagination. He wondered why Archie Weil took such a fancy to Hannibal. If Roseleaf was lucky enough to claim Daisy as his wife, he would never have that figure darken his door.

The letter must have been taken to its destination without delay, for an answer was brought in the course of an hour, stating in the briefest language that Miss Daisy would await him in the parlor, after lunch.

At the table Miss Fern was present, as usual, but not her father, his business in the city keeping him away at that hour. At meals it was Daisy's habit to say little, leaving the conversation to her sister and whoever else happened to be there. At the end of this particular lunch Millicent went up stairs to her chamber and Daisy betook herself to the parlor, followed a few minutes later by the young man.

"Why have you treated me so coldly?" were his first words, when he found himself alone with her.

"Oh, dear, that is a very bad beginning!" she said, smiling. "I shall have to instruct you in some of the simplest things, I see already. When you wish to make friends with a woman, don't begin by scolding her. I am here because you wrote that you wished a kind word. Don't give me too many cross ones, please."

He sighed impatiently.

"Daisy," he exclaimed. "I hope you are not going to make fun of me! I have passed a most miserable week. After the glimpse of heaven you gave me, that evening--"

She put on an air of mock surprise.

"Did I do that! It was much more than I intended, then. I fear you are inclined to use extravagant metaphors, Mr. Roseleaf. But, never mind. You are going away, and I am very, very sorry. However, as you came here on Millie's account, and not on mine, I suppose I have no right to say so."

The fair brow of the young man was a mass of wrinkles.

"I can't understand why you speak so lightly," he answered. "You know--I told you--that I love you--that there is nothing in all the world so dear to me--that I want your promise to be my wife. I can't go from here without that consolation. Daisy, I ask you, in all sincerity, to say that as soon as your father's consent is obtained, you will name a day when you will marry me."

The smile faded from the girl's lips. Something brought to her mind a very sad reflection.

"You ask a great deal," she said. "Much more, I think, than you realize. Until a week ago I was nothing to you. We lived under the same roof, we took our evening strolls together, we talked like the commonest acquaintances, and that was all. Then, in a moment, you discovered that your heart was on fire. I have not ascertained what made the marvellous change. I am sure you cannot tell yet if it be a genuine and lasting one. Were I inclined to believe I ever should be willing to go to the lengths of which you speak, I should assuredly want time for the maturest reflection. In the first place, I know almost nothing about you. One would not engage a--a coachman--without more inquiry. How can a girl promise to trust her entire future to a man with whom she has but a casual acquaintance? Such things need consideration. I know my father would say so. And if he heard only the nicest things about you, I doubt if he would like to have you take me from him--especially now, when his heart is heavy and he leans so much on my love and care. No, you are in too great haste."

His impatience grew to boiling heat as he listened. How could she find so many reasons, and (he was obliged to confess) such sensible ones, to bring against him?

"There is one thing you _can_ do," he said, with an attitude of deep dejection. "You can tell me if you love me."

She tossed her head with a feminine movement that was wholly charming.

"Yes, I could tell you that, but it would be a very improper thing, under the circumstances, provided I was able to give you the answer you seem to wish. If I did care for you, would I like to say so in definite words when anything further might turn out to be impossible? A girl would not wish to have a man that she was never to marry going about with the recollection that she said, 'I love you.'"

"Then you can say nothing at all?" he asked sadly. "Shall I be uncertain whether at the end of my term in purgatory I am to be raised to a state of bliss or dashed into the Inferno?"

She laughed; a delicious little laugh.

"You are getting hyperbolical," she answered. "There are ten thousand better women than I."

"But I don't want them," pleaded the young man. "Did you ever read the lines of Jean Ingelow:

"'Oh so many, many, many Maids and yet my heart undone. What to me are all or any? I have lost--my--one.'"

Daisy replied that the sentiment was very sweet, and added that when a lover could quote such admirable poetry with accuracy, there was hope for him. Do what he would, Roseleaf could not make her see that everything in his future life depended on "one little word" from her. She persisted that he was misled by the violence of his first affection, and that if he would only let a month or two pass he would discover that his pulse would fall off a number of beats to the minute.

"And is that what you want?" he asked, reproachfully. "Would you like to have me come back two months later, and tell you my love had ceased?"

"Yes, if it was the truth. How much better than to learn it after my vows had been pledged and I was bound to you for the rest of my days!"

He rose and went with quick steps to her side, catching up her hand and covering it with kisses. She did her best to stop him, whispering, with a glance toward the door, that they might be interrupted at any minute.

"By whom!" he retorted, stung at her coldness. "Your sister has gone up stairs, and there is no one else in the house."

"Hannibal might come in," she said, in a low tone. "He has no way of knowing that I do not wish to be interrupted."

He grew angry at the mention of that name. But the warning had its effect and he sat down, nearer to her than before, his heart beating rapidly.

"I hate the fellow!" he exclaimed bitterly. "It is a good thing I am going away, or I should strike him some day for his insolence!"

Daisy paled at the vehemence of her companion.

"Has he been insolent to you?" she murmured.

"To me? He would not dare! What angers me is the way he speaks to the rest of you. He came with your cloak that night, acting as if he was your master, instead of your servant. I have heard him speak to Mr. Fern in a way that made me want to kick him! Why does your father bear it? Why do you? Has Hannibal some mysterious hold on his situation?"

The girl heard him patiently, though the roses did not come at once to her white cheek.

"I am afraid," she said, when he had finished his tirade, "that you despise him for his color. It is a prejudice that seems to me--and to my father--unchristian and uncharitable. Perhaps, in the anxiety to make Hannibal forget that God gave him a darker skin than ours, we may have gone to the other extreme, and treated him with too great consideration. But I think you overstate the case."

Her gentle words smote upon the ears that heard them, and in a moment Roseleaf was affected by the most lively contrition. Without attempting to excuse himself he begged her pardon, which she readily granted.

"When do you leave us?" she asked.

"To-morrow morning."

"But you will call--occasionally?"

"If I may."

His tone was so sad that Daisy assured him he ought to have no doubt of that.

"I understand," she added, "that you have probably helped Millie to a reputation that she craves above everything, and she ought not to prove entirely ungrateful. We have enjoyed your stay here, and shall be most sorry to have you go. I should be glad to think you would honor us with your company to dinner not less often than once each week."

For the first time a ray of light came into his face.

"Oh, may I?" he cried. "Then I shall not be shut off entirely from seeing you?"

"No, indeed," she answered. "Father likes you and Mr. Weil too well--you will bring him, of course. Once a week, at least--if it were twice it wouldn't do any harm; and if it were three times--"

His face was now one bright beam of light.

"Daisy," he cried. "I believe you do not hate me after all!"

"I hope you never thought I did," she responded. "Why is it that a man can see no middle ground between positive dislike and marriage? I expect to like a good many men in the course of my life, but I can only marry a very few of them."

He was obliged to laugh at this, and to say that she would only marry _one_, if he had _his_ way. Before they had finished with this subject Roseleaf was in a state of high good nature, though he had little apparently upon which to base the rise in his spirits.

"Can't I say something--just a hint, if no more, to your father?" he asked, getting down again to business.

"Pretty risky!" she answered, sententiously. "He wouldn't give you much encouragement I fear."

The young man caught eagerly at the word.

"You _fear_!" he echoed. "God bless you, Daisy!"

Bearing in mind what she had previously said about the unlocked doors, he did not attempt to suit the action to the phrase. But his happy face spoke volumes.

"You had best say very little to father at present," said Daisy, soberly. "He is most unhappy."

"I wish I knew what troubled him!" he exclaimed.

"I wish so, too, if you could aid him," she answered, earnestly.

"Who knows but I may?" he asked, with a smile that she hoped would prove prophetic.

CHAPTER XI.

ARCHIE PAYS ATTENTION.

Roseleaf took rooms at his old lodgings in the city, and set in earnest about the work of beginning his great novel. He had interviews with Mr. Gouger, at which he detailed the slight thread of plot which he already had in mind, profiting by the critic's shrewd suggestions. It was decided that he should portray, at the beginning, a youth much like himself, who was to fall in love with an angelically pure maiden. The outline of their respective characters were to be sketched with care, and sundry obstacles to their union were to be developed as the story progressed. Gouger warned his young friend not to write too fast, and to content himself for the present with delineating the phase of love with which he had become familiar.

"Later on," he said, "when your hero finds that this girl is not all his bright fancy painted her--when it is proved beyond a doubt that she has played him false, that she has another lover--"

Roseleaf turned pale.

"But that will never be!" he interrupted.

"It will, of course--in the story," corrected Gouger. "She will lead him a race that will make him an enemy to the entire sex, if she is used for all the dramatic effect possible. People expect to find immaculate purity in the earlier chapters of a story, as they do in small children. With the progress of the action they look for something more exciting. To sketch a seraph who remains one would only be to repeat the failure you made in your other effort--the one you brought to me the day I met you first. It is not the glory of heaven that attracts audiences to our churches, but the dramatic quality of hell. A sermon without a large spice of the devil in it would be much worse than a rendition of Hamlet minus the Prince. Put your heroine in the clouds, if you will, at the beginning. The higher she goes, the greater will be her fall, and the greater, consequently, your triumph."

The young novelist shivered as he listened to these expressions. How could he build a heroine on the model of Daisy Fern, and conceive the possibility that she would ever allow her white robes to touch the earth? He might have constructed such a plot with Millicent as the central figure, though that would be by no means easy; but Daisy! Impossible! He asked the critic if it would not do to send the hero of the tale to perdition, while leaving his sweetheart immaculate to the close.

"No," said Gouger, decidedly. "A man's fall is not much of a fall, any way you put it. The public is not interested in such matters. It demands a female sacrifice, like some of the ancient gods, and it will not be appeased with less. I expect you to be new and original in your treatment of the theme, but the subject itself is as old as fiction. You have too little imagination, as I have told you before. You must cultivate that talent. Having conceived your paragon, imagine her placed under temptations she cannot resist; surround her with an environment from which she cannot break; place her in situations that leave her no escape."

Roseleaf shook his head.

"I am afraid I never shall be able to do it," he said.

"Pshaw! Don't talk of failure at this stage of the game. All you have to do is to introduce upon the scene a thoroughly unprincipled man of good address, who is fertile in expedients. You will find your model for that among a dozen of your acquaintances. Why, take Archie Weil, and hold him in your mind till you are saturated with him."

What did Mr. Gouger mean? That Mr. Weil would actually do these dreadful things, would in his own person perpetrate the outrage of winning a pure girl to shame. It seemed childish to ask such a question, and yet such a meaning could easily be taken from what

the critic had said. No, no! All he could have meant was that Mr. Weil might serve as a figure on which to lay these sins--that he could be carried in the writer's mind, as a costumer uses a stuffed frame to hang garments on while in the process of manufacture.

"Then there is Boggs," added Gouger, with a laugh. "You ought to find some place for a fellow like him, if only for the comic parts of your novel, and there must be a little humor in a book that is to suit the mass. A writer for a magazine said recently with much truth, 'He who would hit the popular taste must aim low.' I think Boggs could furnish the cheap fun for an ordinary novel, without too great a wear on the writer. Go ahead, my boy. Write a half dozen chapters in your own idyllic way, and then get Archie to take you to a few places where your mind will be turned to opposite scenes. It takes all sorts of edibles to suit the modern palate."

So Roseleaf wrote, slowly, patiently, with devotion to his art, until he had completed five chapters of his story. And Gouger read it and went into ecstacies, declaring it the best foundation he had ever seen for a most entrancing romance.

"He has wrought his people up to such a superlative height," said the critic to Mr. Weil, "that the _chute_ will be simply tremendous! How simply, how elegantly his sentences flow! If he can handle the necessary wickedness that must follow, the sale of 'Uncle Tom's Cabin,' or 'Thou Shalt Not,' will be eclipsed without the least doubt. But, the question still is, _can_ he?"

"There's no such question," was the response. "He must, that's the way to put it. Confound it, he shall! And the next thing for him to do is to take a few visits with me to the underground regions, where he can get such slight shocks to his literary system as will enable him to take up the vein he must work."

During this time Roseleaf did not forget the invitation he had received to dine with the Ferns. It did him good to see Daisy, although he could not now get her for a moment to himself. He sighed to her over the table, and across the parlor, after the party had retired to that part of the house, and she answered him with little bright smiles that acted like an emollient on his hurt spirit. He had never found the courage to beard her father in his den--of wool--and was not even sure that the affair had reached a stage where anything could be gained by taking such a step. What he wanted was a word of assurance from Daisy that she would wait for him till he had made a Name in literature, or proved his ability in some definite manner. There was no indication that any one else was in the way; everything pointed to a contrary probability. But there is nothing so desolate as the heart of a lover whose fair one is just beyond his reach.

Mr. Weil accompanied Shirley on most of these visits, and knew very well what was going on. None of the glances exchanged between the young people were so much their exclusive property as they believed. Had Archie possessed eyes in the back and sides of his head, he could have seen little more than he did. While appearing to devote his entire attention to Mr. Fern and Millicent--principally the former, he found time to watch Roseleaf and Daisy, and even the negro Hannibal.

He noticed that the servant was no less devoted than formerly to the youngest member of the household. He saw him hover around her at the table like a protecting spirit, letting her want for nothing that thoughtfulness could procure. And he noticed that Daisy seemed as oblivious of this as she had always been. She accepted these extraordinary attentions quite as if Hannibal were some automaton, acting with a set of concealed springs--a mechanism in which there was nothing of human life or intelligence.

Mr. Fern was the same gentlemanly host as of yore, with the same dark cloud hanging over him, whatever might be its cause. Courteous by nature to an exceptional degree he could not assume a gayety he did not feel. There was some terrible weight bearing him down, some awful incubus of which he was unable to rid himself. The only person who did not notice it was Millicent, and the one it troubled most was Daisy, on whose sweet young face the share she had in her parent's griefs had already begun to leave its impressions.

Millicent's novel was soon placed in Mr. Gouger's hands, completed. The original theme was unaltered, but in its new garb of perfect English no one would have recognized the rejected work. The combination of the girl's strength of mind and the man's elegance of diction was successful. The critic recommended its acceptance without a word of dissent, and Cutt & Slashem even consented, on his suggestion, to forego the guarantee against loss which they had of late demanded from all authors whose names were unknown to the reading public.

"I have fixed it for you, Archie," he said, when that gentleman next made his appearance at the sanctum. "No deposit or guarantee, and ten per cent. of the retail price for royalty. So take a train to your inamorata's house and tell her the news."

Mr. Weil did not seem to wholly relish the announcement.

"In the first place," he remarked, "you have no business to speak of Miss Fern as my inamorata; and in the second you will pay her more than ten per cent. or you won't get the book to print."

At this, Mr. Gouger, after the manner of all publishers and their agents, proceeded to show to Mr. Weil that it was perfectly impossible to pay another cent more than the figure he had named; and before he had finished he agreed to see the firm and get the amount raised considerably, provided the sales should exceed five thousand copies. In short, Mr. Weil secured a very respectable contract for a new author, and one that was sure to please Miss Fern, if she was in the least degree reasonable.

"I wish you would hurry up Roseleaf," remarked Gouger, when this matter was disposed of. "When will you take him down into the depths and let him see that side of life?"

"I have arranged a journey for to-morrow night," said Weil. "We shall go to Isaac Leveson's and make an evening of it. Unless things are different there from usual, he will lay the foundation for all the wickedness he needs to put into his story."

The critic nodded approval.

"He will probably have a Jew in it, then--a modernized Fagan."

"Yes," said Weil. "And a negro. A tall, well-built negro, who has a white man for his slave!"

CHAPTER XII.

DINING AT ISAAC'S.

On the following day, when Shirley Roseleaf presented himself at the Hoffman House, he found Mr. Weil awaiting him in a state of great good nature.

"Go home and make yourself ready for a dive into the infernal regions," he said, merrily. "I am going to take you to a place where the devil spends his vacation, and show you a set of women as different from those you have lately met as chalk is from indigo. Be here at nine o'clock this evening, prepared for the descent."

A vision of subterranean passages crossed the mind of the listener, and he thought of tall boots and a tarpaulin.

"How shall I dress--roughly, I suppose?" he inquired.

"Certainly not. Put on your swallow tail, and white tie. Vice in these days wears its best garments. You cannot tell a gambler from a clergyman by his attire. Dress exactly as if you were going to the swellest party on Fifth Avenue. The only addition to your toilet will be a revolver, if you happen to have one handy. If you do not, I have several and will lend you one."

If he expected to startle the young man he was in error. Roseleaf merely nodded and said he would take one of the weapons owned by Mr. Weil.

"We shall not use them--there are a thousand chances to one," said Archie. "New York is like Montana. You remember what the resident said to the tenderfoot, 'You may be a long time without wantin' a we'p'n in these parts, but when you do you'll want it d--d sudden.'"

When Roseleaf returned, the hands of his watch indicated the time at which he had been asked to make his appearance, but Mr. Weil did not take him immediately to the point of destination. Instead he walked over to a variety theatre that was then in operation on Twenty-third street, and after spending a short time in the auditorium guided the young man into the "wineroom." Here the ladies of the ballet were in the habit of going when off the stage, for the sake of entertaining the patrons with their light and frivolous conversation, and inducing them if possible, to invest in champagne at five dollars the bottle.

Archie was, it appeared, not unknown to the throng that filled this place, for his name was spoken by several of both sexes as soon as he entered. He nodded coolly to those who addressed him, and took a seat at a table with his companion. With a shake of his head he declined the offers of two or three fairies of the ballet to share the table, and ordered a bottle of Mumm with the evident intention of drinking it alone with his friend.

Roseleaf slowly sipped the sparkling beverage. He was cautioned in a whisper to drink but one glass, as it was necessary that he should keep a perfectly clear head. Weil remarked in an undertone that he had only ordered the wine as an excuse for remaining a

few minutes.

"I call this 'the slaughter house,'" he added, in a voice still lower. "Girls are brought here to be murdered. Not to have their throats cut," he explained, "but to be killed just as surely, if more slowly. I have seen them come here for the first time, with good health shining out of their rosy cheeks, delighted at the unwonted excitement and the amount of attention the frequenters of the place bestowed. I have watched them growing steadily paler, having recourse to rouge, the eyes getting dimmer, the voice growing harsher, the temper becoming more variable. And then--other fresh faces came in their stead. There are killed, on an average, twenty girls a year here, I should say; killed to satisfy the appetites of men, as beeves are killed in Chicago, but not so mercifully."

The novelist looked into the faces that were nearest to him and thought he could discern the various grades of which his friend spoke--the new, the older, the ones whose turn to give way to others would soon come. All of them were drinking. Most had on the stage dresses they had just worn or were about to wear in the performance. Some had finished their parts and were enveloped in street clothes, ready to take their departure with the first male who asked them. And they were drinking, drinking, either in little sips or in feverish gulps, as they would at a later day, when the five-dollar wine would be replaced by five cent beer or perhaps the drainings of a keg on the sidewalk.

Mr. Walker Boggs soon came into the wine-room and joined the pair at Mr. Weil's table. He called for a whiskey straight, pushing the champagne aside with an impatient movement.

"I won't punish my stomach with such stuff, even if it _has_ gone back on me," he exclaimed. "That will knock out any man who drinks it between meals."

Mr. Weil assented to this proposition, and to show his full belief in it filled his own glass again and tossed its contents down his throat.

"What brings you here?" he asked, quizzically.

"Those creatures," replied Boggs, with a motion of his hand toward the members of the ballet. "They're all that's left me now. _They_ don't mind the size of my waist. My hold on _them_ is as strong as ever. But _you_ ought not to be here," he broke in, turning to Roseleaf. "It will be years before you get to this stage, I hope."

Mr. Weil hastened to explain.

"Shirley is merely observing," said he. "He came at my request. We are going next to Isaac Leveson's."

Mr. Boggs grew interested.

"So, so! You intend to show him Isaac's to-night?"

"Yes. Isn't it a good idea?"

The stout man shrugged his shoulders as if he had nothing to say on that point. The movement was essentially a Frenchy one and might have meant anything.

"Perhaps you would like to go with us," said Archie.

"What do you intend to do there?"

"Tell Mr. Roseleaf all the secrets."

Mr. Boggs stared at the speaker.

"Isaac won't let you," he answered, grimly.

"Won't he? He'll have to. Why, what's the odds? The boy won't give him away. And if he should--" His voice sank to a whisper.

Mr. Weil then proceeded to explain to his young friend that "Isaac's" was a peculiar affair, even for Gotham. It had entrances on two streets. Into one door went the most respectable of people, intent on getting an exceptionably good dinner, which was always to be had there, cooked in the French style and elegantly served. At that end of the house there were several dining-rooms that would hold forty or fifty guests, and several others made to accommodate family parties of six to twelve. If a couple happened to stray in

and inquire for a room to themselves the head waiter informed them that it was against the rule of the house to serve a private dinner to less than four people.

It was evident that the establishment was conducted on the most moral principles, and in a way to prevent the possibility of scandal. For though a great many couples undoubtedly take dinners in private rooms with the utmost propriety, it must be admitted that such a course is open to suspicion and might be used as a basis for unpleasant rumors. Mr. Leveson, who kept this hotel, took great pride in saying that nothing in all New York bore a better name, and no amount of bribery would have induced one of his employes--on _that_ side of the house--to vary the rules laid down.

But on the _other_ side of the building--at the entrance on the other street--ah, that was different!

If only the most respectable customers entered the first door it was almost equally true that none but those who lacked that quality used the second. Mr. Leveson sometimes remarked with glee, at twelve o'clock at night, that he would give a hundred dollar bill for an honest man or woman in any of the rooms up-stairs. The waiters had instructions to "size up" all comers with care, and to admit no accidental parties who might apply for entrance under a misapprehension as to the character of the place.

"We are all full, sorry to say," was the established formula. "There is a very good restaurant just around the corner, on ----th street." And in this manner the shrewd restaurateur got all the custom he wanted, while preserving the natural atmosphere in each part of his dominions.

The meals served in these two places were prepared by one chef, and served from one kitchen. Thus the virtuous and vicious patrons were supplied with exactly the same dishes. But on what may be called the Good side nothing stronger than wines were found on the bill of fare. On the Wicked side every decoction known to the modern drinker was to be had for the asking. Then, again, the doors of the Good side were closed at eleven o'clock, while it was often daylight before the last patron of the Sinful side reeled into his carriage.

After a little more talk Mr. Boggs seemed satisfied and consented to join the party.

Mr. Leveson was notified of the presence of the newcomers and met them at the door. Isaac was of a decidedly Jewish cast of countenance, slightly gray, not very tall, and quite round shouldered. He put out a lank hand toward Roseleaf, when that young gentleman was named as a matter of introduction, but put it down again when Mr. Weil curtly said handshaking was out of date. Archie had seen a disinclination in the eye of his friend to touch the fingers of the Hebrew, and with his usual quickness had solved the difficulty. The party entered a private office at the left of the entrance, where Mr. Leveson inquired what he should order for them to drink.

"You will order nothing, at present," said Weil, in a contemptuous way that excited the astonishment of Mr. Roseleaf. "When I wish for anything I will ring. Who is there in the house?"

The manager of the establishment bowed humbly, and proceeded to run over the list of his customers.

"There is Major Waters and his wife--"

"Together!" exclaimed the questioner.

"Oh, no! The Major has the little blonde that he has brought for the last month; his wife has Mr. Nikles of the Planet. Then--"

But Mr. Weil interrupted him again.

"You'll let them run into each other some day and there'll be a nice time."

"Never fear that. The boys understand thoroughly. He comes earlier and stays later than she. Besides, we never let anybody meet on the stairs. The waiters cry out, 'You must go back; it is bad luck!' if any of them seem in danger of running into each other. They are as safe from discovery here as if they were in places a mile apart."

Some one descended the stairs at this moment and Leveson tiptoed to the door and opened it half an inch to peer at them.

"You know I have no object in saying these things," said Weil, "except to save your precious self from trouble. Who is that going out?"

"Some new people; it is the third time they have been here."

"Well," asked Weil, impatiently, "who are they?"

Leveson held up both his hands as if to beg a moment to answer.

"They come from Brooklyn. I don't know their names. I think neither is married."

"I have a curiosity about things," explained Weil to his friends, "that I cannot account for. You remember how Silas Wegg used to talk about 'Aunt Jane' and 'Uncle Parker.' Well, I have the same way of studying the men that wander in here of an evening, with other people's wives and daughters. There is so little really entertaining in this confounded world that I seize upon anything promising a change with avidity. Isaac tells me all the secrets of his queer ranch, and they prove wonderfully interesting, sometimes. You see," he added, addressing himself particularly to Roseleaf, "not a couple comes into this place that would like to have it known."

Roseleaf bowed constrainedly.

"And how does Mr. Leveson know them?" he inquired. "They surely do not register, or if they do their names must be fictitious."

Mr. Weil laughed.

"He has ways of finding out," said he. "There are little birds that fly in at the window and tell him."

"I should not think he would wish to know," commented Roseleaf. "Especially when it is evident they would not like to have him."

Archie laughed again.

"Let me explain, then," he said. "I need not mind Boggs here, who is discretion itself. Leveson's reason--of course, I can rely on your silence?"

The young face reddened at the insinuation that he might betray a secret.

"I was sure of it," said Archie, so quickly that Roseleaf felt at ease again. "Well, the reason why Isaac wants to know what is going on is, he is connected with the police."

Roseleaf said "Ah!" and opened his eyes wider.

"People who go to places like this," continued Mr. Weil, "are of great interest to the guardians of the peace. And by the police I do not mean the members of the regular force so much as the special service. It is to the latter that we go when a confidential clerk has robbed us or we become suspicious that our wives are unfaithful. Nine times out of ten the chief of the private detective office knows in advance all we wish him to ferret out. When he has told us that we will set investigations on foot, and that he hopes to learn something of the matter within a few days, he bows us out of his bureau with an air that implies that we have not come to the wrong party. And as soon as we are gone he turns to a ledger, and in a few minutes has found an abstract that tells him everything.

"Let us suppose," said Mr. Weil, "that a jeweler misses twenty valuable pieces of _bijouterie_ from his stock. The circumstances prove that they were taken by some one in his employ. He thinks of his clerks, and cannot find the heart to accuse any of them of such a grave crime. He goes to the detective office and states his case. When he is gone the chief turns to the book and finds this:

"'L. M. Jenkins, clerk at Abram Cohen's, Sixth Avenue; about twenty-three, medium height, dark, dresses well. Rooms at No. -- Twenty-Ninth street. Has been giving expensive suppers as well as valuable jewelry to Mamie Sanders, No. so-and-so, Such-a-street. They dined together at Isaac Leveson's on such-and-such dates.' Etc., etc., etc.

"Now, he can recover the jewelry and get that clerk into quod in three hours, if he likes. Naturally he won't expedite things in that way, because he wants some excuse for running up a large bill, unless it be a bank case, where he prefers to make a great impression and get himself solid with the directors. But he will collar the fellow and recover the stuff, and all because he knew about it long before any one in the store had a suspicion."

Mr. Leveson returned. Mr. Weil asked that one of the private rooms on the second floor be put in order at once, for himself and friends. He then inquired what ladies were in the house unoccupied by escorts.

"Miss Pelham has been waiting an hour for the Judge," replied Isaac, "but I don't think he'll come. He disappoints her half the time now. And Mrs. Delavan, who has just come in, found a note from Col. Lamorest, asking her to excuse him to-night."

Archie looked pleased.

"They'll do," he said. "Tell them to come and dine with us. But," he paused, and looked at Roseleaf, "we need still another."

The color mounted to the cheeks of the young novelist, as he understood the thought that prompted this statement.

"Not on my account--I would much rather not," he stammered.

"You will kindly leave that to my judgment," replied Archie, impressively. "Remember, you are not the instructor here, but the pupil. There must be some one else, Isaac."

Mr. Leveson hesitated. He was mentally going over the rooms upstairs and taking stock of what was in them.

"There are two girls," he said, at last, "who used to work in one of the dry goods stores, but you wouldn't want them. They are very strict, and they dress plainly,--and I am afraid the other ladies wouldn't like to associate with them."

Mr. Weil grew vastly irritated by this statement. He brought his hand down on the table with a bang.

"The other ladies!" he echoed, angrily. "When you tell Mrs. Delavan and Jenny Pelham that you want them to dine with us, you know that ends it! As to these shop girls, what do you mean by calling them _strict_? What would a _strict_ girl be doing in _this_ house?"

Mr. Leveson cringed before his interrogator and made the old, imploring movement with his hands.

"Let me explain," he said. "These girls came here a few weeks ago with some traveling men. They took dinner, but Adolf says neither drank a drop of wine. A few days later they came again, with other escorts, and the same thing occurred."

"Why did you let them in?" demanded Weil.

"Because I knew the gentlemen."

Archie started to say something, but checked himself.

"And after that they came alone and asked to see me," pursued Isaac, humbly. "They said they had been thrown out of work, and thought there might be an opportunity to do something here, like waiting on the guests. And while we were talking, two old customers of the house called to dine, alone, and asked me if they could get some one to share the meal with them. And, it seemed quite providential--"

Archie stopped the voluble speech by striking his hands sharply together.

"Enough!" he said. "When the dinner is ready send one of them in. That will make the three we need."

In half an hour the dinner was ready to be served. Then Isaac came with the information that the girls refused to be separated.

"What a nuisance!" exclaimed Weil. "Well, send both of them, then. We'll take care of them, somehow."

CHAPTER XIII.

A QUESTION OF COLOR.

The next morning, when Roseleaf awoke, he was for some time in a sort of stupor. Through the bright sunlight that filled his room he seemed to scent the fumes of tobacco and of liquor. The place was filled, he imagined, with that indefinable aroma that proceeds from a convivial company made up of both sexes. He half believed that Jennie Pelham and Mrs. Delavan were sitting by his bed, more brazen than the bell which, from a neighboring steeple, told him the hour was ten. And surely, by those curtains there, hiding the flame that filled their cheeks, were the two "shop-girls," their pinched faces denoting slow starvation. Boggs, and Isaac Leveson, and Archie Weil were there, all of them; and the young man tossed uneasily on his pillow, struggling with the remnant of nightmare that remained to cloud his brain.

When he was able to think and see clearly he sat up and rang for a pitcher of ice water. He was consumed by thirst, and his forehead ached blindly. When he had bathed his head and throat he turned, by a sudden impulse, to his table, and took out the

MSS. of the story he had begun. Slowly he read over the pages, to the last one. Then, seizing his pen, he devoted himself to the next chapter, without dressing, without breakfasting.

It was four o'clock when he ceased work. He realized all at once that he was feeling ill. The fact dawned upon him that he needed food, and donning his garments, he took his way listlessly to a restaurant and ordered something to eat. As he swallowed the morsels, he fell to wondering how much temptation _he_ would be able to bear, with hunger as a background.

He passed a good part of the evening in walking the streets, selecting, instinctively, sections where he was least likely to meet any one he knew. When he returned to his room he read over the MSS. he had written that day, and into his troubled brain there came a sense of pleasure. Gouger was right. To tell of such matters in a novel, one should know them himself. Roseleaf could never have written of vice before he saw Leveson's. Now, it was as plain to him as print, almost as easy to use in fiction as virtue. What was to follow? He pondered over the plot he had mapped out, and it grew clearer.

Daisy had given him no further encouragement--at least in words--since that day she had said it was "risky" to ask her father, but he felt certain that she regarded him with favor, and that if Mr. Fern put no obstacles in the way she would not refuse to wed him when the right time came. He thought it would be wise to obtain one more brief interview with her, before proceeding to extremities, and determined to do his best to draw her aside, when he made his next visit to her house. This settled, he went to bed again and slept soundly.

When the day to go to Midlands arrived Shirley's courage began to ooze a little. So much depended upon the attitude of his dear one's mind, which, for all he knew, had changed since he talked with her, that he fairly trembled with apprehension. He avoided Mr. Weil, with whom he usually took the train, and went out early. Alighting at a station a mile or two away from the right one, he walked through the woods, trying to think how to act in case matters did not turn out as he hoped. Under the branches he strolled along, until he came within sight of the roofs of Midlands; and then he threw himself at the foot of a tree close to Mr. Fern's grounds, and gave himself up to reverie.

When he laid down here it was only five o'clock, and he was not expected at the house for a full hour. It pleased him to be so near the one he loved, and to lie where he could dream of her sweet face and see the outlines of the house that sheltered her, while she had no knowledge of his presence. Just over there was the arbor, where he had first had the supreme bliss of touching her lips with his own. If he could get her to come there with him again--to-night--when the others were occupied with their talk of earthly things, and if she would only tell him frankly that he might go to her father, and that her prayers would go with him! A soft languor came over his body at the deliciousness of these reflections, but it was dissipated by the sound of voices which presently came to him from the other side of the hedge.

"I can't exactly understand, Miss Daisy," said one of the voices, which he had no difficulty in recognizing as that of Hannibal, "why you wish me to go away?"

There was an assurance in the tone that Roseleaf did not like. He had noticed it before in the intercourse of this negro with his employers. There was something which intimated that he was on the most complete level with them.

"I want you to go," said Daisy, in her quiet way, "because education is the only thing that will make you what you ought to be. There are a hundred chances open to you, in the professions, if you can take a college course. Unless you do, you can hope for nothing better than such employment as you have now."

It made the listener's blood boil to think that these people should be consulting in that way, like friends. Daisy ought to have a better sense of her position.

"I will not refuse your offer, at least not yet," replied Hannibal, after a slight pause. "It may be as you say--if I graduate as a doctor or a lawyer. But I know that I live in a country where my color is despised--and all that could possibly come to me here as a professional man is work among my own race. I should be a black lawyer with black clients; or a black physician, with black patients. To really succeed I should go across the ocean to some land where the shade of my skin would not be counted a crime."

Daisy's face could not be seen by the listener, but he was sure it was a kindly one, and this made him fume. The situation was atrocious.

"It should not be considered so anywhere," said the girl, gently.

"It is an outrage!" responded the black. "Having stolen our ancestors and brought them here from their native country, the Americans hate us for the injury they have done. In France, they tell me, it is not so. Oh, if I _could_ gain an education, and become what God meant to make me--a man!" He paused as if the thought was too great to be conceived in its fullness, and then said, abruptly: "Where can you get this money?"

Roseleaf's suspicions were now keenly aroused and he dreaded lest she should bring his name into the conversation.

"Your father would not give it to you--without an explanation," pursued the negro. "And you have no fortune of your own."

"I will get it--let that suffice," interrupted the girl. "I can give you $1000 a year for two years, at least, and I hope for two or three more, if you will go to Paris and put yourself under instruction. Can you hesitate to accept a proposal of that kind? I thought you would seize it with avidity."

As Daisy said this she arose, and started slowly toward the house. Hannibal walked by her side talking in a tone so low that nothing more was intelligible to the eavesdropper she little suspected was so near. But suddenly the girl stopped, and Roseleaf heard her cry with startling distinctness:

"_How dare you!_"

The voice that uttered these words was filled with rage, and the girl's attitude, as Roseleaf could see--for he had risen hastily to his feet--was one of intense excitement. Then she added:

"If you ever speak of that again, they will be the last words I will ever exchange with you. My offer is still open--you can have the money if you wish it--but never another syllable like this! Understand me, Hannibal, never!"

Miss Daisy passed on toward the house, alone. The negro stood where she had left him, his head bowed on his breast, as if completely cowed by the rebuke. Roseleaf's heart beat rapidly. What gave this fellow such power over these people? How could he say things to call out such an exclamation as that of Daisy's, and yet hold her promise to pay him a large sum of money, instead of getting the prompt discharge he merited?

And this was what the girl wanted to do with the $1,000, she had asked him to lend her! Should he still give it to her? Yes, if it would rid the country of that insolent knave who, from whatever cause, occupied a position that must be growing unendurable to those who had to bear with him.

What had Hannibal said, that made her turn as if grossly insulted, and speak with a vehemence so foreign to her nature? Roseleaf would have enjoyed following the negro and giving him a severe trouncing. Though Hannibal was twenty pounds heavier and considerably taller than he, the novelist had not the least doubt of his ability to master him. He believed the courage of an African would give way when confronted by one of the superior race; and at any rate, righteous indignation would count for something in so just a contest.

There were no traces of excitement on Daisy's pretty face as she welcomed the guests of the family. Weil arrived at about the same time as Roseleaf, coming directly from the station, and Mr. Fern arrived a little later. Millicent looked her best, which is saying no less than that she was a beauty, and Archie told her politely that she ought to sit for a painting. When the dinner was served, Hannibal took charge as usual. Shirley watched him with an interest he had never felt before, and nodded assent when Weil whispered behind his napkin, "Good material for a novel in that fellow, eh?"

The opportunity for a word alone with Daisy came earlier than Roseleaf expected. In fact she herself proposed it, while passing out of the dining room. She said she had something particular to tell him.

"It is about that money you were so kind as to say I could have," she explained, when they were far down the lawn, and out of hearing of the others. "I want it very much and very soon. It--it will be all right, I hope, and--and not cause you any inconvenience."

"I will bring it, or send it to-morrow," he replied, instantly. "But I still wonder what you intend to do with it."

She smiled archly.

"A good act, I assure you," she replied. "Something of which you would certainly approve, if you knew all the circumstances. You are very kind, and if it was darker here I should be--almost--tempted to kiss you."

He replied that it was growing darker rapidly, and that the requisite shadow could be obtained if they stayed out long enough; but she said she could remain but a few moments, and turned in the direction of the house.

"But, Daisy!" he cried, and then paused. "You--you know there is something of very great importance that I want to talk about. I get so little chance, and I want so much to tell you things. I have been trying to go to your father's office, and I can't find courage."

"I didn't know you were thinking of buying wool," she said, mischievously.

"I want one little lamb, to be my own," he answered, "to love and cherish all my life long. Am I never to have it?"

She sobered before the earnestness of his sad face.

"You are a dear boy," she said, "and I love you. There! Don't say anything more to me to-night. I have made a foolish confession, for which I may yet repent. We must go in. They will be looking for us."

She looked at his countenance and saw that it was radiant.

"I can endure anything now," he said. "You love me, Daisy--can it be true? I will go in with you--and I will wait. But not too long, my sweetheart; do not make me wait too long. Repent your confession, indeed! If you do, it will be from no fault of mine. _Daisy!_"

As he said these things they were gradually nearing the piazza, where the negro was taking in the chairs.

"I have something pleasant to tell you," whispered Daisy. "You don't like Hannibal. Well, he is going away soon."

Roseleaf assumed surprise.

"Has your father discharged him?" he asked.

"No, he intends to leave of his own accord. He believes himself fitted for better work. Hush! He may hear you."

As they passed the servant, Daisy said, "Good-evening, Hannibal." It was her invariable custom, and she spoke with the greatest courtesy. But in this case the negro did not raise his eyes, nor turn his head toward her, nor make the slightest sign to show that he heard.

It was too much for Roseleaf, and he stopped.

"Did you hear Miss Daisy address you?" he demanded, sharply.

Hannibal looked up, with a curious mixture of amusement, contempt and hate in his dark face.

"I did," he answered.

"Why did you not answer?"

"Because I did not choose."

Daisy threw herself in front of Roseleaf, just in time to prevent Hannibal's receiving a blow.

"Oh, stop!" she exclaimed, "I beg you!"

The noise and the sound of raised voices brought Mr. Fern and his other daughter, with Archie Weil, to the door. Mr. Fern took in the situation at a glance, and his troubled face grew more distressed.

"Mr. Roseleaf," he said, speaking as if the words choked him, "I am surprised--that you should--hold an altercation like this--in my daughter's presence."

Roseleaf did not know what to do or say. Daisy's pleading eyes decided him, much against his judgment, to drop the matter where it was, galling to his pride though it might be. He escorted his sweetheart into the parlor, where the entire party followed, in a most uncomfortable state of mind.

"How can you permit that negro to insult your guests?" demanded Millicent, as soon as the door was closed. "It is beyond belief. If he is master of this house it is time the rest of us left it. I am certain Mr. Roseleaf did not act without great provocation."

Before Mr. Fern could answer, Daisy had spoken.

"It is over now, and there is nothing to be said. Hannibal is going away in a few days, and that will end your trouble."

The father turned such an incredulous look toward his daughter that it was evident he had heard nothing of this.

"Going?" he echoed, faintly. "Going?"

"Yes," said Daisy. "He told me to-day. He is going to some country where his color will not be counted a misdemeanor."

Roseleaf had difficulty in maintaining the silence with which he had determined to encase himself. But Daisy did not wish him to speak, and her will was law.

"Well, I am glad of that!" exclaimed Millicent. "In a country where they consider such people their equals, he will not meet the pity and consideration he has so abused here. Still, I do think, father, that you ought to apologize to Mr. Roseleaf for the way in which you have addressed him."

This freed the young man's tongue.

"By no means," he said. "Very likely I was wrong to say anything."

"You were not wrong!" retorted Millicent. "You were entirely right. You would have been justified in punishing the fellow as he deserved. It is others who are wrong. If he were not going, I would never stay to see repeated what I have witnessed in the last six months."

Mr. Fern seemed to have lost all ambition for controversy. His elder daughter's cutting words evidently hurt, but he would not reply.

Mr. Weil came to the rescue by introducing a new topic of conversation, that of a European tenor that was soon expected to startle New York. Daisy went to the piano, and played softly, talking in whispers to Roseleaf, who leaned feverishly over her shoulder. But she made no allusion to Hannibal, and he did his best to forget him.

"What do you make of that?" asked Mr. Weil, when he was in a railway car, on the way back to the city with his young friend. "A glorious chance for a novelist to find the reason that black Adonis is allowed such latitude."

But Roseleaf was not listening. He was thinking of a sweet voice that had said: "You are a dear boy and I love you!"

CHAPTER XIV.

"LET US HAVE A BETRAYAL."

Mr. Archie Weil had become quite intimate with Mr. Wilton Fern; so much so that he called at his office every few days, took walks with him on business errands, went with him to lunch (to the annoyance of Lawrence Gouger, who did not like to eat alone) and sometimes took the train home with him at night, on evenings when Shirley Roseleaf was not of the party. Everybody in the Fern family liked Archie. Even Hannibal, who had conceived a veritable hatred for Roseleaf, brightened at the entrance of Mr. Weil either at the house or office, the negro seeming to alternate between the two places very much as he pleased. Millicent liked him because he was so "facile," as she expressed it; a man with whom one could talk without feeling it necessary to pick each step. Daisy liked him because her father did, and because Roseleaf did, and because he treated her with marked politeness that had apparently no double meaning.

And they all got confidential with him, which was exactly what he wanted them to do; only the one he most wanted to give him confidence gave him the least. This was Mr. Fern, himself.

Try as he might, Archie could not discover what clouded the brow of the wool merchant, what made him act like a person who fears each knock at the door, each sound of a human voice in the hallway of his office. He could find no reason for Mr. Fern's attitude toward Hannibal, whose manners were as far removed as possible from those supposed to belong to a personal servant. There must be a cause of no ordinary character when this polished gentleman permitted a negro to insult him and his daughter, in a way to excite comment. What it was Mr. Weil was bent on discovering, but as yet he had made little progress.

It was on account of this plan that Mr. Weil affected to like Hannibal so well. He used to spend hours in devising ways for securing the truth from that source. Hannibal, however, gave no signs of intending to reveal his secret, and if he was going abroad to study, it seemed unlikely that the investigator would get at many facts in that quarter.

One day, Mr. Weil happened to call at the office of the merchant at an hour when the latter was out, and found Hannibal in possession. As this was an opportunity seldom available, Archie entered into a lively conversation with the fellow.

"They tell me you are soon going to leave us," he said, as a beginning. "I hear that you are going to Europe."

"Yes," said Hannibal, with a certain wariness.

"If I can tell you anything about the country I shall be glad," said Weil, affably. "I have spent considerable time there. You don't understand the language, I believe?"

The negro simply shook his head.

"It's easy enough to acquire. Get right into a hotel with a lot of students, and pitch in. Though they _do_ say," added the speaker, archly, "that the best method is to engage a pretty grisette. The poet was right:

"'Tis pleasing to be schooled in a strange tongue By female eyes and lips; that is, I mean, When both the teacher and the taught are young--

"You know the rest."

The answering smile that he expected, did not come into the negro's face. If possible, it grew still more reserved and earnest.

"There's one good thing, if you'll excuse my mentioning it," pursued Archie, "and that is, the French have no prejudice whatever against color. Indeed, a colored student gets a little better attention in Paris than a white one."

Then the silent lips were unlocked.

"Could a black man--_marry_--a white woman, of the upper or middle classes?" asked Hannibal, slowly.

"To be sure. There was the elder Dumas, and a dozen others. I tell you there's absolutely no color line there. They judge a man by what he is, not by the accident of race or skin. You'll see such a difference you'll be sorry you didn't go years before."

Hannibal sat as if lost in thought.

"Mr. Fern will miss you, though," continued Archie. "Yes, and the family. You seem almost indispensable."

A suspicious glance was shot at the speaker, but his face bore such an ingenuous look that the suggestion was dismissed. What could he know?

"They will get some one else," said the negro, quietly.

"Yes, but in these days it is not easy to get people one can trust. Mr. Fern will not find any one to take your place in a moment. And just now, when he evidently has a great deal of trouble on his mind, it will be unpleasant to make a change."

Hannibal was completely deceived by the apparently honest character of these observations. He could not resist the temptation to boast a little, that peculiar trait of a menial.

"I know all about Mr. Fern's affairs," he agreed. "Both here and at the house. He would not trust the next man as he has me."

Mr. Weil nodded wisely.

"I see, I see," he answered. "You know then what has annoyed him of late--that which has puzzled all the rest of us so much. You know, but having the knowledge in a sort of confidential capacity, you would, of course, have no right to reveal it."

Hannibal straightened himself up in an exasperating way.

"You will not find what troubles Mr. Fern," he said, loftily. "And now, may I ask _you_ something. Do you expect to marry his eldest daughter?"

An inclination to kick the fellow for his impudence came so strong upon Mr. Weil that it required all of his powers to suppress the sentiment. But through his indignation there struggled his old admiration for this elegant physical specimen. He wished he could get a statue modeled from him, before the original left the country.

"That is a delicate question," he managed to say.

"I know it," replied Hannibal. "But I have observed some things which may have escaped you. Shall I tell you what I mean?"

Not at all easy under this strain, the curiosity of Mr. Weil was so great that he could only reply in the affirmative.

"Miss Millicent," explained Hannibal, slowly, "is in love--very much in love--with another person."

A stare that could not be concealed answered him.

"You have not seen anything to indicate it?" asked the negro. "I thought as much. She has done her best to cover it, and yet I can swear it is true. She _likes_ you, as a friend. But she _loves_ him, passionately."

He was in for it now and might as well follow this strange matter to the end.

"Do I know this individual?" asked Archie.

"Yes. You brought him to the house and introduced him to her."

The man gave a slight cry, in spite of himself.

"Not Roseleaf!"

Hannibal bowed impressively; and at the moment Mr. Fern's footsteps were heard in the entry.

Mr. Weil did not know, when he tried to think about it afterwards, whether the wool merchant noticed particularly that he and Hannibal had been talking together, or suspected that they might have confidences. His head was too full of the startling statement he had heard, and when he was again upon the street he wandered aimlessly for an hour trying to reconcile this view with the facts as they had presented themselves to his mind previously.

Millicent in love with Roseleaf! She had said very little to the young man, so far as he had observed. Her younger sister--sweet little Daisy--had monopolized his attention. If it were true, what an instance it was of the odd qualities in the feminine mind, that leave men to wonder more and more of what material it is constructed. But _was_ it true? Was Hannibal a better judge, a closer student, than the rest of them? He did not like Millicent, any better than she liked him. Was he trying a game of mischief, with some ulterior purpose that was not apparent on the surface?

Out of it all, Archie Weil emerged, sure of but one thing. He must use his eyes. If Millicent loved Roseleaf, she could not hide it successfully from him, now that he had this clue.

The girl's novel was selling fairly well. Weil had made a bargain with Cutt & Slashem that was very favorable. It gave him an excuse to talk with the authoress as much as he pleased, and he used his advantage. He brought her the comments of the press--not that they amounted to anything, for it was evident that most of the critics had merely skimmed through the pages. He came to tell her the latest things that Gouger had said, what proportion of cloth and paper covers were being ordered, and the other gossip of the printing house. And now he talked about the work that Shirley was engaged on, and grew enthusiastic, declaring that the young man would yet make a place for himself beside the Stevensons and Weymans.

Millicent struck him as caring much more for news of her own production than that of the young man who had been represented as the object of her adoration. If she was half as fond of Roseleaf as Hannibal intimated, she was certainly successful in concealing her sentiments from the shrewd observer. The result of a fortnight's investigation convinced Weil that the negro had made a complete mistake, and all the hypotheses that had arisen were allowed to dissipate into thin air and fly away.

Another two weeks passed and Hannibal still remained with the Ferns. An inquiry of Daisy produced the answer that he thought of remaining in America till spring. The girl tried to act as if it made not the slightest consequence to her whether he went or stayed, but she did not succeed. Mr. Weil knew that she wished most heartily for the time when the negro would take his departure. She was bound up in her father, and Hannibal was worrying him to death--from whatever cause. She wanted the tie between him and this black man broken, and hated every day that stood between them and his hour of sailing.

Roseleaf was almost as uneasy as Daisy over the delay. He had given her the money she asked for, though no allusion to its purpose had been made.

She still had it, somewhere, unless she had given it to the one for whom it was intended. When she took the package from his hand she rose on her tiptoes and kissed him with the most affectionate of gestures. It was the second occasion on which he had been permitted to touch her lips, and he appreciated it fully. He realized from her action how deeply she felt his kindness in providing her with the funds that were to relieve her father of an incubus that was sapping his very life.

"You don't find much use for our black Adonis yet, I see," said Weil, as he laid down the latest page of the slowly building novel. "I had hoped you would penetrate the secret of his power over your heroine's father, by this time."

"No, I cannot understand it at all," replied Roseleaf. "And if you, with your superior quickness of perception, have found nothing, I don't see how you could expect me to."

"You have greater opportunities," said Weil, with a smile that was not quite natural. "You have the ear of the fair Miss Daisy, remember," he explained, in reply to the inquiring look that was raised to him.

"Ah, but she knows nothing, either," exclaimed Roseleaf. "I am sure of that."

Mr. Weil was silent for some moments.

"Well, if you cannot find the true cause," he said, "you will have to invent a hypothetical one. Your novel cannot stand still forever. Imagine something--a crime, for instance, of which this black fellow is cognizant. A murder--that he peeped in at a keyhole and saw. How would that do?"

Roseleaf turned pale.

"You know," he said, "that you are talking of impossibilities."

"On the contrary, nothing is impossible," responded the other, impatiently. "College professors, delicate ladies, children not yet in their teens, have committed homicide, why not this handsome gentleman in the wool business? Or if you _won't_ have murder--and I agree that blood is rather tiresome, it has been overdone so much--bring a woman into the case. Let us have a betrayal, a wronged virgin, and that sort of thing."

The color did not return to the young man's cheek.

"Which is still more incredible in the present case," he said. "Do you think Wilton Fern could do evil to a woman? Look in his face once and dismiss that libel within the second."

A desperate expression crossed the countenance of the elder man.

"You must agree that he has done something!" he cried. "He wouldn't allow a darkey to annoy him like this for fun, would he? He wouldn't wear that deathly look, and let his child grow thin with worriment, just as a matter of amusement!"

To this Roseleaf could not formulate a suitable answer. He felt the force of the suggestions, but he would not associate crime with the sedate gentleman who was the object of these suspicions. He simply could not think of anything disreputable in connection with Daisy's father, and it seemed almost as bad to invent an offense for the character in his novel whose photograph he had thus far taken from Mr. Fern.

Daisy was surprised, a month after this, to have Mr. Weil stop her in the hallway, and speak with a new abruptness.

"Why don't that cursed nigger start for Europe?" he asked.

She glanced around her with a frightened look. She feared ears that should not might hear them. But she rallied as she reflected that Hannibal was miles away, in fact in the city with her father.

"He is going soon," she replied. "But why do you allude to him by that harsh term? I thought you rather liked him."

"I do," he answered. "I like him so well that if he continues to talk to--to your father--as I heard him the other day, I will throw him into the Hudson: I can't stand by and see him insult an--an old man--much longer."

The girl looked at him with sad eyes.

"I thought I had succeeded in silencing that kind of talk," she said. "Mr. Roseleaf used to speak very violently of Hannibal, but he has listened to reason of late. Let me beg you to see nothing and hear nothing, if you are the friend of this family you have given us reason to believe."

She extended her hand, as if to ask a promise of him, but he affected not to see it.

"When does he intend to go?" he demanded.

"Before the 1st of April."

"I will give him till that date," he answered, "but not an hour beyond. He will sail out of this country for some port or other, or there will be a collision. You must not, you shall not defend him!" he added, as she was about to speak. "I know the harm he is doing, and it must have an end!"

Turning from her suddenly he went out of doors. Far down the road he stopped to look around, pressing his hand to his forehead, like one who would make sure he is awake, and not the victim of some fearful dream.

CHAPTER XV.

THE GREEN-EYED MONSTER.

Before the first of April came, Hannibal sailed. During the winter he had taken lessons in French of a city teacher, until he believed he could get along after a fashion with that language. He announced to Daisy that he would go on the third of March, then he changed it to the tenth, and again to the seventeenth. Each time, when the date approached, he seemed to have a weakening of purpose, a dread of actually plunging into the tide that set toward foreign shores. The girl had interviews with him on each of these occasions, at which what passed was known only to themselves. And each time, when she had reached her own room, she threw herself on her bed and wept bitterly.

But, at last, on the twenty-fourth, he went. With his overcoat on his arm, his satchel and umbrella in his hands, he said "Good-by" to the little party that gathered at the door. He had been treated with great consideration in that home. Perhaps he realized this to some extent as he was about to turn his back upon it. Certain it is that he could not hide the choking in his throat, as he said the words of farewell. Archie Weil, who stood there with the rest, thought he saw a strange look in those black orbs as they dwelt a moment on the younger daughter; but it passed so quickly he could not be sure.

Mr. Fern was there, and Roseleaf. Millicent had responded, when a servant went to inform her that Hannibal was going, that she was very glad. Did she wish to go down? By no means. She hoped she was not such a fool.

Weil, who watched everybody, saw an unmistakable relief in the careworn countenance of Mr. Fern, when the tall form of his late servant disappeared at the gate.

"I hope you will do well," had been the last words of the merchant, and Daisy had added, "So do we all, I am sure." Roseleaf had not spoken. He had stood a little apart from the others, his mind filled with varying emotions. It was he who had furnished the money to carry out this plan, and if it made one hour of Daisy's life happier he would be content.

Within an hour it was evident that a cloud had been lifted from the entire household. Everybody felt brighter and better. Roseleaf eyed Mr. Fern with surprise, and had half a mind to go to his office the next day and tell him how dearly he loved his daughter. It was the first time anything like a smile had been upon that face since he had known its lineaments.

Archie Weil devoted his attention, as usual, to Millicent. He did not talk to her about Hannibal, knowing how distasteful was the subject. He discussed her novel, of which she never seemed to tire, and asked her about another, which she had begun to map out. She told him she was sure she could do better the next time, and spoke of the assistance Mr. Roseleaf would furnish if needed, quite as if that was a matter already arranged between her and the young novelist.

Archie wondered if Millicent knew the extent of the attachment that had grown up between Shirley and her sister. She seemed to feel sure that he would be at hand when wanted. Could it be that she believed he would ultimately become her brother-in-law? The negro's guess had almost been blotted out of his mind. There had been absolutely nothing in his observation to confirm it.

A day or two after the departure of Hannibal, Mr. Fern had a conversation with Daisy, in which he dwelt with more stress than she could account for on a special theme. He was talking of Walter Boggs and Archie Weil, and he cautioned her earnestly to treat both gentlemen with the greatest consideration. The girl detected something strange in his voice, and she stole apprehensive glances at him, hoping to read the cause in his eyes.

"Why, papa, I never see Mr. Boggs," she said. "It is weeks and weeks since he came here. As for Mr. Weil, we all treat him nicely, I am sure, and are glad to have him come."

"Yes," he admitted. "You use him quite right, my child. I am not complaining; only, if you could show him _particular_ attention, something more than the ordinary--" He paused, trying to finish what he wished to say. "There may be a time when he will be of great value to me--and--I want him to feel--you observe things so cleverly--do you think Millicent cares for him?"

Daisy looked up astonished.

"Cares--for--Mr. Weil?"

Her father nodded.

"He has been here several times a week for months, and most of his time here has been spent with her. I thought--I hoped that she cared for him."

He thought! He hoped! Daisy had never had such an idea in her head until that moment. She had a dim idea that her father would give up either of his daughters with great regret, although she could not help knowing that the relations between him and Millicent were not as cordial as those between him and herself. And he "hoped" that Millie would marry, and that she would marry Mr. Weil! Her mind dwelt upon this strange thought. She tried to find a reason for it. Was there any stronger incentive in her father's mind than a desire to see Millie well settled in life, with a good husband?

Had he a fear that the time might soon come when he could not provide for her?

Or was there a worse fear--the kind of fear that had haunted him in relation to Hannibal?

Every time Mr. Weil came to the house after that the young girl watched him as closely as he had ever watched her. He did not exchange a word with her father that did not engage her attention. And the conclusion she came to was that, whatever the object of Mr. Fern in this matter, Mr. Weil was honor itself.

Daisy had never made much of a confidant of Millicent, and the latter had the habit of keeping her affairs pretty closely to herself. It was no easy task, then, that the young sister had in view when she came to a decision to talk with Millie about Mr. Weil.

Her father had expressed a hope that Millie and Weil would marry. Mr. Fern had some strong reason for his wish. Whatever it was, Daisy, with her strong filial love, wanted it gratified.

"Millie, what do you think of marriage?" she asked, one day, when the opportunity presented itself.

"I suppose it's the manifest destiny of a woman," replied her sister, quietly.

Much encouraged, Daisy proceeded to allude to Mr. Weil, praising him in the highest terms, and saying that any girl might be proud to be honored with his addresses. Millie answered with confirmatory nods of the head, as if she fully agreed with all she uttered. But when her sister spoke, the words struck Daisy like a blow.

"I am glad to hear this," she said, in a voice more tender than usual. "I think Mr. Weil would have proposed to you long ago, but that he feared the result."

Daisy gasped for breath.

"Millie!" she cried. "Do you mean that Mr. Weil--that--why, I do not understand! He has hardly spoken to me, while he has spent nearly every minute he has been here, with you!"

"Of course he has," responded the other. "What could be more like a case of true love? If ever a man lost his head over a woman he has lost his over you, Daisy. And, at any rate, you must know that _I_ care nothing for him. You certainly could see where _my_ affections were engaged."

Daisy pressed her hand dreamily to her forehead. She had never known her sister to show the least partiality to any other man.

"I understand you less than ever," she faltered.

"Are you so blind?" exclaimed Millicent, with superior wisdom. "Did you think Mr. Roseleaf had been so closely engaged all this time in my literary work without learning to care for me? I presume you will think I ought to blush, but that is not my way. The strangest thing is that I should have to explain what I thought every one knew."

Poor little Daisy! She was so crushed by these statements that she did not know what reply to make, which way to turn for consolation.

"He has told you that he loves you?" she managed to articulate.

"He has shown it, at least," was the answer. "He had not been here a week before he tried to put his arms around me. I had to let him hold my hand to avoid an absolute quarrel. He is not an ordinary man, Daisy, and does not act like others, but we understand each other. He is waiting for something better in his business prospects, and as I am so busy on my new book I am glad to be left to myself for the present."

It was the old story. Daisy could not doubt her sister's version of her relations with Mr. Roseleaf. When he called the next time there was a red spot in both her cheeks. He told her with happy eyes that he had at last secured something which made it possible to speak to her father. He had been offered a position on the Pacific Quarterly, at a good salary, and another periodical had engaged him to write a series of articles.

"They tell me I have no imagination," he explained, "but that I do very good work on anything that contains matters of fact. I have some money of my own, but I did not want to tell your father I was an idle fellow, without brains enough to make myself useful in the world. The novel on which I base such great hopes might not seem to him worth considering seriously, you know. So I can go with a better account of myself, and I am going this very week."

The bright light that shone from the face at which she looked made her waver for a moment, but she found strength to answer that he must not speak to Mr. Fern about her--now, or at any other time. She did not want to marry, or to be engaged. She wanted to live with her father, and take care of him, and she wanted nothing else.

"Millie will marry," she added, as a parting thrust, meant to be very direct and bitter. "One of us ought to stay with papa."

For a while he was too overwhelmed by her changed attitude to make a sensible reply. When it dawned on him that she meant what she said, he appealed to her to take it back. He could not bear the thought of giving her up, or even of waiting much longer for the fulfillment of his hopes. He spoke in the most passionate tone, and his whole being seemed wrought up by his earnestness. The girl was constantly thinking, however, that this was the same way he had addressed Millicent, and that there was no trust to be placed in him.

"Calm yourself," she said, when he grew violent. "I have tried to be honest with you. I have thought of this matter a great deal. You will admit that it is of some importance to me."

"To you!" he echoed. "Yes, and to me! I do not care whether I live or die, if I am to lose you!"

She wanted to ask him if he had told Millie the same thing, but she could not without making an explanation she did not like to give.

"There are others," was all she said. "Others, who will make you happier, and be better fitted for you--in your career as a writer."

He never thought her allusion had reference to any particular person, and he answered that there was no one, there never could be any one, for him, but her. He had never loved before, he never should love again. And she listened, thinking what a capacity for falsehood and tragic acting he had developed.

After two hours of this most disagreeable scene, Roseleaf left the house, moody and despondent. It would have taken little at that moment to make him throw himself into the bosom of the Hudson, or send a bullet through his brain.

On the way to the station he met Mr. Weil, who could not help asking what was the matter.

"Oh, it's all up!" he answered. "She has refused me, and I am going to the devil as quick as I can."

"What are you talking about?" exclaimed the other, staring at him. "You don't mean--Daisy!"

"That's just what I mean. I went there to tell her of my good luck, and to say I was going to ask her father's consent; and she met me as cold as an iceberg, and said she had decided not to marry. So I'm going back to town without a single reason left for living."

Mr. Weil stood silent and nonplussed for a few seconds. Then a bright idea came into his head.

"Look here, Mr. Impetuousness," said he. "I know this can be arranged, and I'm going to see that it's done. My God, the same thing happens in half the love affairs the universe over! Give me a few days to straighten it out. Go home and go to work, and I'll fix this, I promise you."

It took some time to persuade Roseleaf to follow this advice, but he yielded at last. Weil pleaded his warm friendship, begged the young man to do what he asked if only to please him, and finally succeeded. A few minutes later Archie had secured an audience with Daisy.

Too shrewd to risk the danger of plunging directly into the subject he had in mind, Mr. Weil talked on almost everything else. It happened that Millicent was away, which enabled him to devote his attention to the younger sister without appearing unduly to seek her. But Daisy, only half listening to what he said, was pondering the strange revelation her sister had made, and thinking at each moment that a declaration of love might be forthcoming.

She remembered her father's injunction to treat this man with particular courtesy, and was in a quandary what to do in case he came to the crucial point. But to her surprise, instead of pressing his own suit, Mr. Weil began to support in a mild manner the cause of Mr. Roseleaf.

"I met Shirley leaving here," he said, in a sober tone, "and he was in a dreadful state. You didn't say anything cross to him, I hope."

With these words there seemed to come to Daisy a new revelation of the true character of this man. Loving her himself, he was yet loyal to his friend, who he believed had a prior claim. As this thought took root it raised and glorified its object, until admiration became paramount to all other feelings.

"Why should I be cross to him?" she asked, evading the point. "There are no relations between us that would justify me in acting as his monitor or mentor."

Mr. Weil shook his head.

"He loves you," he said. "You cannot afford, my child, to trifle with a heart as noble as his."

The expression, "my child," touched the girl deeply. It had a protective sound, mingled with a tinge of personal affection.

"I hope you do not think I would trifle with the feelings of any person," she said. "Still, I cannot marry every man who may happen to ask me. You know so much about this matter that I feel justified in saying this; and I earnestly beg that you will ask no more."

But this Mr. Weil said gently he could not promise. He said further that Roseleaf was one of his dearest friends, and that he could not without emotion see him in such distress as he had recently witnessed.

"You don't know how fond I am of that boy," he added. "I would do anything in my power to make him happy. He loves you. He will make you a good husband. You must give me some message that will console him."

He could not get it, try as he might; and he said, with a forced smile, that he should renew the attack at an early date, for the cause was a righteous one, that he could not give over unsatisfied. He took her arm and strolled up and down the veranda, in such a way that any visitor might have taken them to be lovers, if not already married. She liked him better and better. The touch of his sleeve was pleasant. His low tones soothed the ache in her bosom, severe enough, God knows! When her father came from the city he smiled brightly to see them together, and after hearing that Millicent was away, came to the dinner table with the gayest air he had worn for months.

Another week passed, during which Mr. Weil went nearly every day to Midlands, and communicated to Roseleaf on each return the result of his labors, coloring them with the roseate hues of hope, though there was little that could legitimately be drawn from the words or actions of Miss Daisy. The critic for Cutt & Slashem had also been given more than an inkling of the state of affairs, and had perused with delight the chapters last written on the famous romance. He saw that the next experience needed by the author

was a severe attack of jealousy, and as there was no one else to play the part of Iago he himself undertook the role.

"Archie Weil is pretty popular with the Fern family, isn't he?" was the way he began, when he called on Roseleaf. "I met the old gentleman the other day and he seemed absolutely 'gone on' him, as the saying is. They tell me he's out at Midlands every day. Got his eye on the younger daughter, too, they intimate."

It takes but little to unnerve a mind already driven to the verge of distraction. The next time that Weil saw Roseleaf, the latter received him with a coolness that could not be ignored. When he pressed for a reason, the young man broke out into invective.

"Don't pretend!" he cried. "You've heard of the case of John Alden. What's been worked once may go again. I'm not entirely blind."

Mr. Weil, with pained eyes, begged his friend to explain.

"Tell me this," shouted Roseleaf. "Do you love that girl, yourself?"

Unprepared for the question, Archie shrank as from a flash of lightning, and could not reply.

"I know you _do_!" came the next sentence, sharply. "And I know that it is owing to the inroads you have made--not only with her but with her father--that I have been pushed out. Well, go ahead. I've no objection. Only don't come here every day, with your cock and bull stories of pleading _my_ cause, for I've had enough of them!"

The novelist turned aside, and Mr. Weil, too hurt to say a word, arose and silently left the room. His brain whirled so that he was actually giddy. Not knowing where else to turn he went to see Mr. Gouger, to whom he unbosomed the result of his call.

"Don't be too serious about it," said Gouger, soothingly. "It's a good thing for the lad to get his sluggish blood stirred a little. In a day or two he'll be all right. That novel of his is coming on grandly!"

Weil was in no mood to talk about novels, and finding that he could get no consolation of the kind he craved, he soon left the office. The critic laughed silently to himself at the idea of the biter having at last been bitten, and then took his way to Roseleaf's rooms.

No answer being returned to his knock, he opened the door and entered. At first he thought the place was vacant, but presently he espied a still form on the bed. The novelist was stretched out in an attitude which at first suggested death rather than sleep, and alarmed the visitor not a little. Investigation, however, showed that he was simply in a tired sleep, worn out with worry and restless nights.

"What a beauty!" whispered Gouger. "A very dramatic scene could be worked up if that sweetheart of his were brought here and made to stand beside the couch when he awakes. Yes, it would be grand, but it would need his own pen to trace the words!"

The hardly dry pages of the great manuscript that lay on an adjacent desk caught the eyes of the critic, and he sat down to scan them closer. As he turned the leaves he grew so delighted as to become almost uncontrollable.

"He's a genius, nothing less!" he said, rapturously, and then tiptoed softly from the chamber.

CHAPTER XVI.

"I'VE HAD SUCH LUCK!"

One day Mr. Fern came home in a state of great excitement. He had not acted naturally for a long time and Daisy, who met him at the door, wondered what could be the cause of his strange manner. He caught his daughter in his arms and kissed her like a lover. Tears came to his eyes, but they were tears of joy. He laughed hysterically as he wiped them away and told her not to mind him, for he was the happiest man in New York.

"I've had such luck!" he exclaimed, when she stared at him. "Oh, Daisy, I've had such grand luck!"

She led him to a seat on a sofa and waited for him to tell her more.

"You can't imagine the relief I feel," he continued, when he had caught sufficient breath. "I've had an awful time in business for years, but to-day everything is all cleared up. The house over our heads was mortgaged; the notes I owed Boggs were almost due; I had given out paper that I could see no way of meeting. And now it is all provided for, I am out of financial danger, and I have enough to quit business and live in ease and comfort with my family the rest of my days!"

Daisy could only look her surprise. She could not understand such a transformation. But she loved her father dearly, and seeing that he was happy made her happy, too; though she had had her own sorrows of late.

"Tell me about it, father," she said, putting an arm around his neck.

"You couldn't understand, no matter how much I tried to make it clear," he answered, excitedly. "There was a combination that meant ruin or success, depending on the cast of a die, as one might say. Wool has been in a bad way. Congress had the tariff bill before it. If higher protection was put on, the stocks in the American market would rise. If the tariff rate was lowered they would fall. I took the right side. I bought an immense quantity of options. The bill passed to-day and the President signed it. Wool went up, and I am richer by two hundred and fifty thousand dollars than I was yesterday!"

For answer the girl kissed him affectionately, and for a few moments neither of them spoke.

"I don't wonder you say I can't understand business," said Daisy, presently. "It would puzzle most feminine brains, I think, to know how a man could purchase quantities of wool when he had nothing to buy with."

The father drew himself suddenly away from her, and gazed in a sort of alarm into her wide-opened eyes.

"That is a secret," he said, hoarsely. "It is one of the things business men do not talk about. When stocks are rising it is easy to buy a great deal, if one only has something to give him a start."

"And you _had_ something?" asked Daisy, trying to utter the words that she thought would please him best.

"Yes, yes!" he answered, hurriedly. "I--had--something! And to-morrow I shall free myself of Boggs, and of--of all my troubles. I shall pay the mortgage on the house, and we can have anything we want. Ah! What a relief it is! What a relief!"

He panted like a man who had run a race with wolves and had just time to close the door before they caught him.

"May I tell Millie?" asked the girl. "She has worried about the house, fearing it would be sold."

He shook his head as if the subject was disagreeable.

"She will find it out," he said. "There is no need of haste. And at any rate I don't want you to give her any particulars. I don't want her to know how successful I have been. You can say that I have made money--enough to free the home. Don't tell any more than that to any one. It--it is not a public matter. I was so full of happiness that I had to tell you, but no one else is to know."

Daisy promised, though she asked almost immediately if the prohibition extended to Mr. Weil. He was such a friend of the family, she said, he would be very much gratified.

She had reached thus far in her innocent suggestion, when she happened to glance at her father's face. He was deathly pale. His body was limp and his chin sunken to his breast.

"Father!" she exclaimed. And then, seized with a nameless fear, was about to summon other help, when he opened his eyes slowly and touched her hand with his.

"You are ill! Shall I call the servants?" she asked, anxiously.

He intimated that she should not, and presently rallied enough to say he was better, and required nothing.

"What were we speaking of?" he asked, in a strained voice.

"We were talking of your grand fortune, and I asked if I might not tell Mr.--"

He stopped her with a movement, and another spasm crossed his face.

"You will make no exception," he whispered. "None whatever. My affairs will interest no one else. If you are interrogated, you must know nothing. Nothing," he added, impressively, "nothing whatever!"

Mr. Fern's recovery was almost as quick as his attack, although he did not resume the gaiety of manner with which he had opened the subject. After dinner he talked with Daisy, declaring over and over that she had been on short allowance long enough, and asserting that she must be positively in a state of want. She answered laughingly that she needed very little, and then suddenly

bethought herself of something and grew sober.

"Do you feel rich enough to let me exercise a little generosity for others?" she inquired.

He replied with alacrity that she could do exactly as she pleased with whatever sum he gave her, and that the amount should be for her to name.

"You don't know how big it will be," she replied, timidly.

"I'll risk that. Out with it," he said, smiling.

"Supposing," she said, slowly, "that I should ask for a thousand dollars?"

"You would get it," he laughed. "In fact I was going to propose that you accept several thousand, and have it put in the bank in your name, so you would be quite an independent young woman. You must have your own checkbook and get used to keeping accounts. I will bring you a certificate of deposit for three thousand dollars, and each six months afterwards I will put a thousand more to your credit, out of which you can take your pin money."

It seemed too good to be true, and the girl's face brightened until it shone with a light that the father thought the most beautiful on earth. Now she could return the thousand dollars she had borrowed of Mr. Roseleaf, a sum that had given her much uneasiness since she broke off her intimate relations with the young novelist. More than this, she would have sufficient on hand to send the future amounts that Hannibal would need to keep him abroad. It was such a strange and delightful thing to see smiles on her father's face that she did not want anything to disturb them. She was quite as happy as Mr. Fern, now that this cloud had been lifted from her mind.

The next day was a bright one for the wool merchant. By noon he had sent for Walker Boggs and astonished that gentleman by handing him a check in full for the entire amount of his indebtedness. In answer to a question he merely said he had been on the right side of the market. Mr. Fern also settled with his mortgage creditor, and went home at night happy that his head would again lie under a roof actually as well as in name his own. Notes which he had given came back to him soon after, and he burned them with a glee that was almost saturnine. Burned them, after looking at their faces and backs, after scanning the endorsements; burned them with his office door locked, using the flame of a gas-jet for the purpose.

The ashes lay on the floor, when a knock was heard and Archie Weil's voice answered to the resultant question. Mr. Fern lost color at the familiar sound, but he mustered courage.

"I've come to congratulate you," said Archie, warmly. "They say you have made a mint of money out of the rise in wool."

"Who says so?" asked Mr. Fern, warily.

"Everybody. Don't tell me it's not true."

"I've done pretty well," was the evasive reply. "And I'm going out of business, too. It seems a good time to quit."

Mr. Weil made a suitable answer to this statement and the two men talked together for some time. After awhile the conversation took a wider turn.

"Where's your young friend, Roseleaf?" asked Mr. Fern, to whom the matter did not seem to have occurred before. "I don't believe I have seen him at Midlands for a month."

"No, he doesn't come," replied Archie, growing darker. "If you wish a particular reason, you will have to ask it of your daughter."

Mr. Fern looked as if he did not understand.

"He became very fond of her," explained Archie, "and for some reason, he does not know what, she has evinced a sudden dislike to him."

Mr. Fern looked still more astonished.

"Millie is a strange girl," he ventured to remark. "But I supposed--I was almost sure, her affections were engaged elsewhere; and, really, I thought he knew it."

Mr. Weil stared now, for it was evident his companion was far from the right road. He was also interested to hear that Miss Fern had anything like a love affair in mind, for he had supposed such a thing quite impossible.

"I was not speaking of Miss Millicent, but of Miss Daisy," he said.

The wool merchant rose from his chair in the extremity of his astonishment.

"You meant that--that Mr. Roseleaf--was in love with Daisy!" he said. "And that she seemed to reciprocate his attachment?"

"I did. And also that a few weeks ago she asked him to cease his visits, giving no explanation of the cause of her altered demeanor. He is a most excellent young gentleman," continued Weil, "and one for whom I entertain a sincere affection. Her conduct is a great blow to him, especially as he does not know what he has done to deserve it. I trust the estrangement will not be permanent, as they are eminently suited to each other."

The face of Mr. Fern was a study as he heard this explanation.

"If he was an honorable man, why did he not come to _me_?" he asked, pointedly.

"He was constantly seeking Miss Daisy's permission to do so," replied Archie. "Which she never seemed quite willing to give him."

"She is too young to think of marriage," mused Mr. Fern, after a long pause.

"He is willing to wait; but her present attitude, giving him no hope whatever, has thrown him into the deepest dejection."

From this Mr. Weil proceeded to tell Mr. Fern all he knew about Roseleaf. He said the young man was at present engaged on literary work that promised to yield him good returns. He had a small fortune of his own beside. Everything that could be thought of in his favor was dilated upon to the fullest extent.

"I don't believe I can spare my 'baby,'" said Mr. Fern, kindly, "for any man. You plead with much force, Mr. Weil, for your friend. How is it that _you_ have never married. Are you blind to the charms of the sex?"

For an instant Archie was at loss how to reply.

"On the contrary," he said, at last, "I appreciate them fully. I have had my heart's affair, too; but," he paused a long time, "she loved another, and there was but one woman for me. Perhaps this leads me to sympathize all the more with my unfortunate young friend."

Mr. Fern said he would have a talk with Daisy, and learn what he could without bringing in the name of his informant.

"We fathers are always the last to see these things," he added. "It would be terrible to give her up, but I want her to be happy."

CHAPTER XVII.

A BURGLAR IN THE HOUSE.

Millicent Fern lay wide awake a few nights later, at Midlands, when the clock struck two. She was thinking of her second novel, now nearly ready for Mr. Roseleaf's hand. There was a hitch in the plot that she could best unravel in the silence. As she lay there she heard a slight noise, as of some one moving about. At first she paid little attention to it, but later she grew curious, for she had never known the least motion in that house after its occupants were once abed. She thought of each of them in succession, and decided that the matter ought to be investigated.

Millicent had no fear. If there was a burglar present, she wanted to know. She arose, therefore, and slipped on a dress and slippers. Guided only by the uncertain light that came in at the windows, she tiptoed across the hall, and in the direction in which she had heard the noise. She soon located it as being on the lower floor where there were no bedrooms, and a thrill of excitement passed over her. She crept as silently as possible down the back stairs, and toward the sound, which she was now sure was in the library.

What was the sound? It was the rustling of papers. It might be made by a mouse, but Millicent was not even afraid of mice. She was afraid of nothing, so far as she knew. If there was a robber there, he would certainly run when discovered. At the worst she could give a loud outcry, and the servants would come.

She tiptoed along the lower hall. A man sat at her father's desk, examining his private papers so carefully, that he seemed wholly lost in the occupation.

The room was quite light. In fact, the gas was lit, and the intruder was taking his utmost ease. His face was half turned toward the girl, and she recognized him without difficulty.

It was Hannibal!

Hannibal, whom she supposed at that moment in France!

Without pausing to form any plan, Millicent stepped into the presence of the negro.

"Thief," she said, sharply, "what do you want?"

They had hated each other cordially for a long time, and neither had changed their opinion in the slightest degree. Hannibal looked up quietly at the figure in the doorway.

"I have a good mind to tell you," he said, smiling.

"You will _have_ to tell me, and give a pretty good reason, too, if you mean to keep out of the hands of the police," she retorted. "Come!"

He laughed silently, resting his head on his hands, his elbows on the desk. Millicent's hair hung in a loose coil, her shoulders were but imperfectly covered by her half buttoned gown, the feet that filled her slippers had no hosiery on them. She was as fair a sight as one might find in a year.

"Do you remember the time I saw you in this guise before?" he asked, in a low voice.

A convulsion seized the girl's countenance. She looked as if she would willingly have killed him, had she a weapon in her hand. But she could not speak at first.

"It was you who sought me then," said the negro. "And because I bade you go back to your chamber, you never forgave me. Have you forgotten?"

Gasping for breath, like one severely wounded, Millicent roused herself.

"Will you go," she demanded, hotly, "or shall I summon help?"

"Neither," replied Hannibal. "If you inform any person that I am here, I will tell the story I hinted at just now. Besides, I would only have to wait until your father came down, when he would order them to release me, and say I came here by his request."

Millicent chafed horribly at his coolness.

"Came here by my father's request!" she echoed. "In the middle of the night! A likely story. Do you think any one would believe it?"

"I do not think they would. It would not even be true. But he would say it was, if I told him to, and that would answer. Don't you know by this time that I have Wilton Fern in a vise?"

Yes, she did know it. Everything had pointed in that direction. Millicent could not dispute the insinuation.

"What has he done, in God's name, that makes him the slave of such a thing as you?" she cried.

"I will answer that question by asking another," said the negro, after a pause. "Do you know that Shirley Roseleaf hopes to wed your sister?"

The shot struck home. With pale lips Millicent found herself trembling before this fellow.

"You love him," pursued the man, relentlessly. "You do not need to affirm or deny this, for I know. He loves Daisy, and unless prevented, will marry her. I hold a secret over your father's head which can send him to the State prison for twenty years. If I confide it to you, will you swear to let no one but him know until I give you leave?"

The girl bowed quickly. She could hardly bear the strain of delay.

"Then listen," said the negro. "To save himself in business he has committed numerous forgeries upon the names of two men. One of them is Walker Boggs and the other Archie Weil. Very recently he has been successful in his speculations, and has called in many notes with these forged endorsements. But the proofs of his crimes are ample, and I possess them. If he ever proposes to let Roseleaf marry Daisy, hint to him of what you know, and he will obey your will. I shall be in the city. Here is my address. If you need me I am at your service. Understand, I shall not harm your father unless he makes it necessary. I only mean to use the fear of what might await him, and you can do the same. It is time I was going. I have found all I want here, though I had enough before."

He handed Millicent a card on which was the address he had mentioned, and she allowed herself to take it from his hand. Then he started to pick up a package of papers that lay where he had put them on the table, when a third figure, to the consternation of both, brushed Millicent aside, and stepped into the room. It was the younger sister.

"Give that to me!" she demanded, imperiously, reaching out her hand for the package.

The apparition was so unexpected that the previous occupants of the library stood for a few seconds staring at it without moving a step. Daisy was dressed in much the same manner as Millicent, but she thought only of the danger that threatened one she loved better than life--her father.

"Give that to me!" she repeated, approaching Hannibal closer.

Without a word the negro, his head bowed, handed it to her.

"And now," she said, in the same quick, sharp tone, "the others!"

"They are not here," he answered, huskily.

"Where are they?"

"At my lodgings in the city."

Instantly Daisy snatched the card from her sister's hand.

"At this place?" she asked, hastily scanning the writing.

"Yes," said Hannibal, in a voice that was scarcely audible.

"I will be there this morning at ten o'clock. See that they are ready."

The negro bowed, while his chest heaved rapidly.

"And now," said the girl, pointing to the door, "go!"

He hesitated, as if he wanted to say more to her, but recollecting that she would meet him so soon, he turned and obeyed her. At the threshold he only paused to say, "You must come alone; otherwise it will be of no use." And she answered that she understood.

She followed some paces behind and closed the door after him, pushing a bolt that she did not remember had ever been used before.

Then she turned to encounter her sister; but Millicent had disappeared.

CHAPTER XVIII.

BLACK AND WHITE.

When Daisy reached her own room again, she felt assured that no one but herself and Millicent knew what had occurred. This was something. Had her father awakened, she did not know what might have followed. She had seen him too often, pale and distraught, in the presence of his relentless enemy, not to entertain the greatest thankfulness that he had slept through this terrible experience. At any cost it must be kept from him. She would beg, pray, entreat Millicent to seal her lips. And in the morning she would go to the address Hannibal had given her and obtain his proofs of her father's guilt, removing the frightful nightmare that had so long hung over that dear head.

Would Hannibal surrender his documents? He had made a tacit promise to do so, and she had faith that she could make him keep his word. She knew the negro had a liking for her that was very strong.

She had made it possible for him to become a man--by giving him the money that took him to France. Why had he returned so suddenly? What new fancy had caused him to give up his studies and recross the sea to enter her doors at night, to plunder still further secrets from her father's private desk? There were a thousand reasons for fear, but the devoted daughter only thought of saving the one she loved at all risks. She would dare anything in his behalf.

And this father of hers--that she had revered from babyhood--was a forger! He had made himself liable to a term of imprisonment in the common jail! He was a criminal, for whom the law would stretch out its hand as soon as his guilt was revealed! His previous high standing in the community could not save him; nor the love of his children; nor his new fortune--won by such means as this. Nothing could make his liberty secure but the silencing of the witness to his fault, the negro who had carefully possessed himself of certain facts with which to ruin his benefactor.

What did Hannibal want? Surely he had no revenge to gratify, as against her or her father! They had treated him with the greatest consideration. Only once--that day on the lawn--had Daisy spoken to him in a sharp tone, and then the provocation was very great. Since then she had raised the money that was to make a man of him. What did he require now? An increased bribe to keep him away? Well, she would get it for him. She would spend one, two, three thousand dollars if necessary to purchase his silence; if it needed more she could borrow of--of Mr. Weil.

Yes, Mr. Weil was the friend to whom she would turn in this emergency. He had lost nothing, apparently, by the unwarranted use of his name. The notes on which his endorsement had been forged were all paid. When she met Hannibal she would ascertain his price and then the rest would be easy. Her father need not even know the danger to which he had been exposed.

In the morning she went to Millicent's room early, in order to have a conversation with her undisturbed. Millicent was sleeping soundly and was awakened with some difficulty.

"I've only been unconscious a little while," she said, in explanation. "I thought I never should sleep again. Oh, what a disgrace! My father a forger! Liable to go to prison with common criminals, to wear the stripes of a convict! It seems as if my degradation could go no lower."

Reddening with surprise at the attitude of her sister, Daisy answered that the thing to be thought of now was how to save Mr. Fern from the consequences of his errors.

"You're a strange girl," was Millicent's reply. "You don't think of me at all! Won't it be nice to have people point after me in the street and say, 'There goes one of the Fern girls, whose father is in Sing Sing!' I never thought I should come to this. There's no knowing how far it will follow me. I doubt if any reputable man will marry me, when the facts are known."

Thoroughly disgusted with her sister's selfishness, Daisy cried out that the facts must _not_ be known--that they must be covered up and kept from the world, and that she was going to bring this about. She reminded Millicent of the evident suffering their father had undergone for the past two years, changed from a light-hearted man into the easily alarmed mood they had known so well.

"If he deserved punishment, God knows he has had enough!" she added. "And there is another thing you and I ought not to forget, Millie. Whatever he did was in the hope of saving this home and enough to live on, for us! During the last week he has had an improvement in business. He has paid all of those people whose claims distressed him. You have seen how much brighter it has made him. Now, when he had a fair prospect of a few happy days, comes this terrible danger. Surely you and I will use our utmost endeavors to shield him from harm. Even if he were the worst of sinners he is still our father!"

But Millicent did not seem at all convinced. She could only see that her reputation had been put in jeopardy, and that a dreadful fear would constantly hang over her on account of it.

"It is your fault, as much as his, too!" she exclaimed, angrily. "You both made as much of that negro as if he were a prince in disguise. I've told you a hundred times that he ought to be discharged. I hope you'll admit I was right, at last."

There was little use in reminding her sister that Hannibal had shown himself the possessor of some information that endangered Mr. Fern before either he or Daisy began to cultivate his good will; for she knew it well enough. What Daisy did say was more to the point.

"Have you _always_ hated him?" she asked, meaningly. "What did he mean last night by his reference to a time when you _sought_ him, _en dishabille_?"

Millicent sprang up in bed, with flashing eyes.

"He is a lying scoundrel!" she cried, vehemently. "I never did anything of the kind, and I do not see how you can stand there and repeat such a calumny!"

"The strange thing about it," replied Daisy, quietly, "is that you did not dispute him. But then, you did not know a third person was present. When I meet him this morning I shall ask for further particulars."

Millicent sprang from the bed and threw herself at her sister's feet.

"Would you drive me mad!" she exclaimed. "I am distracted already with the troubles of this house, and now you wish to hear the lying inventions of one you know to be a blackmailer and a robber! Don't mention my name to him, I entreat you. He is capable of any slander. You can't intend to listen to tales about your sister from such a low, base thing!"

Having Millicent at her feet, Daisy was pleased to relent a little.

"Very well," she said. "I will not let him tell me anything about you. But I want you to promise in return that you will do all you can to protect father from the slightest knowledge of what happened last night. I am afraid it would kill him. So far he believes us ignorant of his troubles. If I can make an arrangement to send Hannibal back to France he will remain so. Be sure you do not arouse his suspicions in any way, and we may come out all right yet."

The promise was made, and, as nothing could be gained by prolonging the conversation, Daisy withdrew. In the lower hall she met her father, and his bright smile proved to her that he was still in blissful ignorance that any new cloud had crossed his sky. Millicent did not appear at breakfast, for which neither of the others were sorry. It enabled Mr. Fern to talk over some of his plans with his younger daughter. Among them was a possible trip abroad, for he said he felt the need of a long rest after his troubled business career.

The last suggestion opened a new hope for Daisy. If worse came to worst, and there was no other way to escape the jail, flight in a European steamer could be resorted to. It would mean expatriation for life, as far as he was concerned, but that would be a thousand times better than a lingering death inside of stone walls. He could raise a large sum of ready money, and they would want for nothing. Millie would not wish to go with them, probably. She would stay and marry--how the thought choked Daisy--marry Mr. Roseleaf; unless indeed, the young novelist did what she had foreshadowed, repudiated the thought of allying himself with a tainted name.

Roseleaf! The bright, happy love she had given him came back to the child like a wave of agony.

Making an excuse that she had shopping to do, Daisy took the train to the city with her father, and parted from him at a point where the downtown and uptown street cars separated. Then she took a cab and drove to the address given her.

It was not the finest quarter in the city, and she would have hesitated at any other time before taking such a risk as going there alone. At present she thought of nothing but the object of her visit. Inquiry at the door brought the information that the lady was expected and that she was to go upstairs and wait. The woman who let her in was a pleasant faced mullatress, and several young children of varying shades were playing on the stairs she had to ascend. Daisy mounted to the room designated, which proved to be a small parlor, with an alcove, behind the curtains of which was presumably a bed.

As the weather was quite warm, the girl went to the front windows and opened them, in order to admit the fresh air. Then she sat down and waited impatiently. There was a scent in the room which she associated with the Ethiopian race, a subtle aroma that she found decidedly unpleasant. It gave her an indefinable uneasiness, and she mentally remarked that she would be glad when the ordeal was over. Her nerves were already beginning to suffer.

After the lapse of fifteen minutes, Hannibal entered. He had the look of one who had passed a sleepless night, and despite the blackness of his complexion, his cheeks seemed pale.

"Good-morning," said Daisy, rising.

"Good-morning," he replied.

And then there was a brief space of silence, each waiting for the other.

"I am here, you see," said the girl, finally, with an attempt at a smile. "And now will you give me the things I came for, as I cannot stay long?"

The negro tried to look at her, tried many times, but failed. His eyes shifted uneasily to all the other objects in the room, resting on none of them more than a second at a time.

"You wonder," he said, after another pause, "why I returned to America, why I came to your house last night. I thought I could tell you--this morning--and I have been trying to prepare myself to do so--but I cannot. You blame me a great deal, that is evident in every line of your face, but you do not know what I have suffered. Were your father to go to jail for the term the law prescribes, he would not endure the agony that has been mine."

He looked every word he spoke and more.

"I am sorry, truly sorry for you," she replied. "But why could you not leave all your troubles, when you went to France, and begin an entirely new life? You found it true what I told you, I am sure, about the lack of prejudice--on account of your--race."

He nodded and cleared his throat before he spoke again.

"Oh, yes; but it is not the prejudice _there_ that worries me. It is the prejudice _here_. It is the barrier my color brings between me and the only being whose regard I crave!"

The girl's cheeks grew rosier than ever, but she affected not to understand, and once more reverted to the errand that had brought her thither.

"You promised me the documents with which my poor father has been tortured," she said, reproachfully; "let us not talk of other things until you have given them to me."

The negro drew from a pocket of his coat a fair-sized package tied with a ribbon.

"They are all there," he said. "Every scrap, every particle of proof, everything that could bring the breath of suspicion upon your father's honesty. All there, in that little envelope."

She reached for it, but instead of giving it to her, Hannibal caught her hand, and before she dreamed what he intended, pressed a kiss upon it. The next moment the girl, with a look of outraged womanhood, was rubbing the spot with her handkerchief, as if he had covered it with poison.

"You brute!" she exclaimed. "You--you--"

She could not find the word she wanted; nothing in the language she spoke seemed detestable enough to fill the measure of her wrong.

"You see!" he answered, bitterly. "Because I am black I cannot touch the hand of a woman that is white. You have claimed to be without the hatred of the African so ingrained among Americans; you have talked about the Almighty making of one blood all the nations of the earth; and yet you are like the rest! A viper's bite could not have aroused deeper disgust in you than my lips. And all because the sun shone more vertically on my ancestors than it did on yours!"

Daisy was divided between her horror of the act he had committed and her anxiety to do something to free her father from his danger. She suppressed the hateful epithets that rose to her tongue and once more entreated the negro to give her the packet he held in his possession.

"You can do nothing with it but injure a man who has been kind to you," she pleaded. "And if you use the information you have, and afterwards repent, it will be too late to remedy your error. Give it to me, and return to France with the proud consciousness that you are worthy the position you wish to occupy."

Hannibal shook his head with decision.

"That would be very well if I ever could be considered a man by the one for whose opinion I care most. But while I am to her a creature something below the ape, a mere crawling viper whose touch is pollution, I will act like the thing she thinks me. To-day I

possess the power to make a high-born gentleman dance whenever I pull the string. You ask me to give up this power, and in return you offer--nothing."

"One would suppose," remarked Daisy, struggling with herself in this dilemma, "that the ability to inflict pain was one a true nature would delight to surrender. My father has done no harm to you."

The negro bent toward her and spoke with vehemence.

"But his daughter has! She has made my life wretched. Whatever position I may attain will be worthless to me, without the love I had hoped might be mine."

"_Love!_" cried the girl, recoiling. "_Love!_"

"Love and marriage," he replied. "In France we could live without the hateful prejudices that prevail in America. I have natural ability enough, you have told me so a thousand times, and I could make myself worthy of you. As my wife--"

Daisy rose and interrupted him fiercely.

"Cease!" she exclaimed. "There is a limit to what I can endure. If you mean to make any promise of that kind a prelude to my father's freedom from persecution, we may as well end this conversation now as later. He would rather rot in prison than have his child sacrifice herself in such a manner!"

She started toward the door, and he did not interrupt her passage, as she half expected he would do; but he spoke again.

"All this because I am black," he said.

"Because you are a cruel, heartless wretch!" she answered, her eyes flashing. "Because you have abused the goodwill of a generous family; because you have tortured a kind old man and a loving daughter. If you were as white as any person on earth, I would not marry you. Worse than all outward semblance is a dark and vile mind. Do what you like! I defy you!"

The door opened and closed behind her. Hannibal heard her retreating footsteps grow fainter on the stairs, and then there was silence.

"I might have known it," he said, aloud. "I did know it, but I kept hoping against hope. She would wed a Newfoundland dog sooner than me. Nothing is left but to make her repent her action. I will bring that father of hers to the dust, if only to revenge the long list of injuries his race has inflicted on mine!"

CHAPTER XIX.

"PLAY OUT YOUR FARCE."

When Daisy left the house where she had the interview with Hannibal, she walked for some minutes aimlessly along the street. Her mind was in a state of great excitement. She realized that she had defied a man who could inflict the deepest injury on the father she dearly loved. How she could have done otherwise was not at all clear, but the terror which hung over her was none the less keen. The proposal of the negro--to marry her--filled her with a nameless dread that made her teeth chatter, though it was a warm day. Rather would she have cast her body into the tides that wash the shores of Manhattan Island. Even to save her father from prison--if it came to that--she could not make this sacrifice. She now felt for Hannibal a horrible detestation, a feeling akin to that she might entertain for a rattlesnake. Whatever good she had seen in him in other days had vanished under the revelations of his true character.

What to do next was the absorbing question. A great danger hung over her father. A dim idea of seeking the mayor--or the chief of police--and imploring their mercy, entered her brain. Then she thought of Roseleaf, whose aid she might have secured, if he had not proved himself a double-dealer, capable of making love to herself and Millicent at the same time. And then came the resolve to seek out Mr. Weil, the one person in all this trouble that seemed clear of wrong. Her sister had told her that he loved her. Well, if necessary she would marry him. At least he was a man of honor, and white. Yes, she would go to him and throw herself upon his mercy.

Daisy knew that Archie made his headquarters at the Hoffman House, and summoning a cab she asked to be taken to that hotel. Ensconced in the ladies' parlor she awaited the coming of the man she wanted and yet dreaded so much to see. Luckily he was in the house, and in a few moments responded in person to her card.

"Why, Miss Daisy," he stammered. "What is the matter? Nothing wrong, I trust. You look quite pale. Is it anything--about--your father?"

The girl was pale indeed. Now that Mr. Weil was so close, the danger that he might not be willing to help her rose like a mountain in her path. She did not know exactly how grave a matter forgery was--whether it was something that the injured party would be able or likely to forgive. If she should tell him everything, and he should refuse to be placated--what could she do then?

There was no one else in the parlor, but seeing that she wanted as much seclusion as possible, Mr. Weil motioned the girl to follow him to a remote corner, where the curtains of a recessed window partially concealed them. He felt that she had come on a momentous errand. His suspicions concerning Mr. Fern were apparently about to be verified, and if so, he did not mean that other ears should hear the tale.

"Mr. Weil," began Daisy, tremblingly, "I don't know what to say to you. I am in great distress. Would you--will you--help me?"

He responded gently that he would do anything in his power. He bade her calm herself, and promised to be the most attentive of listeners.

Reassured by his kind words and manner, the girl began again; but she could not tell her story connectedly, and after making several attempts to do so, she broke out in a new direction.

"I want so very much of you, dear Mr. Weil. And I am nervous and afraid to ask what I would like. I will give you anything you please in return. Yes, yes, anything."

He smiled down upon her face, on which the tears were making stains in spite of her.

"You are promising a great deal, little girl," he said.

"I know it; I realize it fully," she responded quickly. "But I mean all I say. I did not think I could, once, but I am quite resolved now. Millie told me you were in love with me, and feared I would refuse you. But I won't. No, no, I will marry you--indeed I will--if you will only save my darling father!"

The concluding words were spoken in the midst of a torrent of sobs that shook the girlish frame and affected powerfully the strong man that witnessed them.

"Daisy, dear child, don't speak like this," he answered. "If I can do anything for your father I will most gladly, and the price of your sweet little heart shall not be demanded in payment, either. Leave that matter entirely out of the question, and tell me at once what you desire."

She heard him with infinite delight, and wiping her eyes she began, in broken tones, to relate the history of Hannibal's revelations. As she proceeded his brow darkened, and when she had finished he muttered something that sounded very much like a curse.

"And what do you wish of me?" he asked, when she had ended.

"To keep him from having my father put in prison; to give us time to escape, if there is no other way; and to forgive the harm to yourself. I know," she added earnestly, "it is a great deal to ask, but I have no one else to go to. He has paid every cent, and you will lose nothing. Tell me, dear Mr. Weil, is there anything you can do?"

He had the greatest struggle of his life to keep from bending over that trembling mouth and pressing upon it the kiss he knew she would not refuse; that mouth he had coveted so long and which must never be touched by his lips!

"Can I do anything?" he repeated. "Certainly. I can stop that fellow so quickly he won't know what ails him. Have no fear Miss Daisy. Go home and rest in peace. Before the sun sets I will remove the last particle of danger from your father's path."

The girl sprang to her feet and would have thrown her arms around his neck had he not prevented her.

"You are certain you can do this?" she cried, beaming with happy eyes upon him.

"There is not the least question of it. But--I must demand payment for my trouble. I shall not do this work for nothing."

With a hot blush Daisy lowered her eyes to the carpet.

"I have already told you what I will do," she said, trembling. "If you accomplish what you say, have no fear but I shall keep my word."

There was an element of pride and truth in the way she spoke that struck the hearer strongly. The reverent smile on his face grew yet deeper.

"I am placed in a peculiar situation," he said, after a slight pause. "Your sister has, unintentionally, no doubt, misrepresented matters in a way that may be embarrassing for us both. When I have removed the troubles that stand in your way, I will talk this over with you."

Daisy looked up quickly. What could he mean?

"I beg you to explain," she stammered. "If there has been any mistake no time can be better to set it right than now."

The man toyed with the lace of the window curtain. He had no intention of evading his duty, and yet he did not find it agreeable as he proceeded.

"Your sister told me," he said, finally, "that--you loved me. She was wrong. I knew all the time she was wrong. You have just offered to give yourself to me in marriage in exchange for the efforts that I am to make on your father's behalf. But I would not marry a woman who did not love me--who only became mine from gratitude. No, I could not accept you under such circumstances."

The young girl glanced at him timidly.

"I wish you knew how much I liked you," she said. "I never knew a man I respected more."

"That is most gratifying," he answered, "for I hold your good opinion very highly. You must think I speak in riddles, for I have said that I demand payment for my services, and yet that I would not accept the greatest gift it is in your power to bestow upon me. Let me wait no longer in my explanation. When I have put your father out of all danger from this blackmailer--and I can easily do it, never fear--you must do justice to Shirley Roseleaf."

She shivered at the name, as if the east wind blew upon her.

"He is not a true man," she replied, in a whisper. "He has forfeited all claim to my consideration."

"Why do you say that? I am afraid there is another misunderstanding here, my child."

Then he drew out of her, slowly at first, the revelations that Millicent had made. And he disposed of the charges, one by one, until there was nothing left of them.

"Could you--would you--only go with me to his rooms," he added, "and see him lying there, wan and pale, disheartened at the present, hopeless for the future, you would change your mind. He has never in his life loved but one woman, and that one is yourself. I will not undertake to say why you have been told differently, though I could guess. Shirley Roseleaf loves you, Miss Daisy, and you love him. When I have made good my promise, I shall ask you to come to my friend's side and bring him back to health with the sunshine of your presence."

Daisy was more than half convinced, for the strong affection she had had for the young man plead for him in every drop of her blood.

"Is he so very ill?" she asked, dreamily.

"He has not left his room for a week," was the answer. "Nothing his friends can say will move him. He is in such a state of mind that he even refuses to have me with him; me, until very lately, his closest friend. But if I tell him you have relented, there is no medicine on earth will have such an instant effect."

The girl thought for some moments without speaking.

"It is my father first, of course," she said at last. "But while you are arranging matters concerning him, I do not see any reason to keep me from helping a sick boy. I--yes, I will go with you now."

He looked the gratitude he could not speak, and fearful that in her mercurial mood she might change her mind, he accompanied her without delay to the street, and procured a cab, in which they were driven rapidly to Roseleaf's lodgings. On the way, with that loved form so near him, Archie Weil had a constant struggle. She might be his, if he would forget duty.

And he loved her! God, how he loved her! He could marry her, and perhaps after a fashion make her happy. The perspiration stood on his forehead as he dwelt on the bliss that he had resolutely cast aside.

Roseleaf's landlady came to the door in person and informed the callers that her guest was in about the same condition as he had been for some days. He was not ill in bed, but he did not leave his room. When she sent up his meals he received them mechanically, and they were often untouched when the domestic went for the dishes. He wrote several hours a day, though he was undoubtedly feeble. Did he have any visitors? Only one, Mr. Gouger, who was with him at the present moment. Should she go up and announce them? Very well, if it was not necessary. Mr. Weil could show the lady into the adjoining room, which was empty, until he had announced her presence in the house to his friend.

Archie whispered to Daisy when he left her at Roseleaf's door, that he would come for her as soon as possible. He did not enter the sick boy's chamber at once, for something in the conversation that came to his ears arrested his steps at the threshold. Mr. Gouger's voice was heard, and Archie's ears caught the sound of his own name.

"You should let me send to Mr. Weil," said Gouger. "I am sure he can explain everything. You have written all you ought for the present. He would take you to ride and bring the color to those white cheeks of yours."

"But he cannot bring me the girl I love," responded Roseleaf, with a profound sigh. "Even if I have done him injustice, she is lost to me now. You know appearances were against him. Why, you agreed with me about it. I don't want to see any one. I want to go away from here, and forget my sorrows as best I can in some far distant place."

There was a sadness in the tone that went to the listener's heart. The door was slightly ajar and Archie took the liberty of looking into the room. Roseleaf lay stretched out in a great chair, and Gouger leaned over him, appearing for all the world like some sinister bird of prey. Mr. Weil felt for the first time in his life that there was something uncanny in the aspect of the book reviewer. He did not think he could ever be close friends with him again. And what did Shirley mean by saying that Lawrence had "agreed" with him when he heard such base opinions?

The critic was fingering with apparent satisfaction a pile of MSS. that lay on the table. It had grown vastly since Archie saw it the last time, and must be fifteen or twenty chapters in extent now.

"You must not go away until you have finished this wonderful work," replied Gouger, with concern. "A few more months--a little further experience in life--and your reputation will be made! Ah, it is wonderful! It is magnificent! The world will ring with your praises before the year is ended. Such fidelity to nature! Such perfection of detail! In all my career I have never seen anything to approach it!"

Shirley moved uneasily in his chair.

"Do you ever think at what cost I have done this?" he asked. "I know the pain of a burn because I have held my hands in the fire. I know the agony of asphyxiation, because I have dangled at the end of a rope. I can write of the miner buried beneath a hundred feet of clay, because I have had the load fall on my own head. To love and find myself beloved; then to see happiness snatched without explanation from my grasp; to feel that my best friend has been the one to betray me! That is what I have passed through, and from the drops of misery thus distilled, I have penned those lines you so much admire. I have written all I can of these horrors. I will not begin again till I have caught somewhere in the great sky a glimpse of sunlight!"

Mr. Weil could wait no longer. He pushed open the door and went to the speaker's side.

"The sunlight is awaiting you," he said, gazing down upon the figure in the armchair. "You have only to raise your curtain."

Mr. Gouger sprang up in astonishment at the sudden arrival, and perhaps a little in alarm also; for he could not tell how long the visitor had been eavesdropping at the portal. But Roseleaf turned his languid eyes toward his old friend, and was silent.

"Shirley, my boy," pursued Weil, with the utmost earnestness, "I can prove to you now that Daisy Fern loves you and you alone."

Roseleaf did not move. His lips opened and the words came stiffly.

"You can promise many things," he said, "but can you fulfill any of them?"

So cold, so unlike himself!

"What will convince you?" demanded Weil. "Shall I bring a letter from her? Or would you rather she came in person, to tell you I speak the truth?"

The shadow of a smile, a smile that was not agreeable, hovered around the corners of the pale mouth.

"I shall write no more," said the lips, when they opened, "until I have seen her and heard the reason for my rejection. I will discover who my enemy is. I will unmask the man or the woman that has done me this injury. Till then, I shall write no more. No, not one line."

Mr. Gouger was nonplussed by the new turn in affairs. He knew that Weil had some basis for what he said, that he was not the man to come with pretence on his tongue. Neither of the other persons in the room paid the least attention to him, any more than if he had not been present. It was like a play, at which Gouger was the only spectator.

"Could you bear it if I brought her to you to-day, if I brought her here now?" asked Archie, beseechingly. "If I go and get her, and she comes with me, will the shock harm you?"

The ironical smile deepened on the face of the younger man.

"Play out your farce," he said.

Casting one look of apprehension at Roseleaf, Mr. Weil turned toward the door that entered the hallway. Before he could reach it, a female form came into the room and caught his arm. Together they faced the recumbent figure in the chair. This lasted but a moment. Then Daisy broke from her escort and threw herself at her lover's feet.

"Come," whispered Archie, to the critic. "Let us leave them alone."

CHAPTER XX.

LIKE A STUCK PIG.

Hannibal was neither better nor worse, morally, because his color was black. There are men with white complexions who would have done exactly as he did. There are others as dark as Erebus who would have done nothing of the sort.

He was no ordinary negro. His intelligence was above the average. When he first entered the employ of Mr. Fern, that gentleman took every pains to encourage the aptitude for learning that he found in him. Hannibal accompanied his employer to his office, where he was entrusted with important commissions, which he seemed for a long time to execute with faithfulness and discrimination. At home he performed his duties in a way that gave great satisfaction. At the end of the first six months Mr. Fern would have hated to part with a servant that he believed difficult to replace.

But the great source of trouble arose gradually. Hannibal began to entertain a sentiment for his master's younger daughter that was impossible of fruition. Daisy treated him in the most considerate manner, never dreaming what was going on behind his serious brow. Millicent, ungovernable in all things, began early to show the bitterest enmity toward the negro, while her sister, seeing that her father liked and appreciated him, tried by her own kindness to compensate for the other's rudeness. What caused Millicent's feelings Daisy had no means of knowing, and she had not the least suspicion until she heard the conversation in the library the night the house was entered. Even then she did not take the subject much to heart, for she did not comprehend all that Hannibal had meant to convey in the brief and sarcastic expression he used. Daisy had a mind too pure to believe anything so heinous of her own sister as Hannibal had intimated.

The passion of love is a thing that grows in curious ways. What made it seem to Hannibal that there was hope for him was the discovery that Mr. Fern was committing forgeries and that the proofs might be his for the taking. If he could hold such a power as that over this gentleman, who could say that even so great a mesalliance as his daughter's marriage to an African might not be

arranged?

The negro proceeded cautiously. He secured the proofs he wished, and let Mr. Fern know tacitly that he had them. The terror, the undisguised fear that followed, the admittance of the menial to a totally different position in the household and the office, showed that the servant had not underrated the importance of his acquisition.

Not one word bearing directly on the subject passed between them. The condition of the merchant was more horrible than it would have been had his employe said outright, "I have the proof that you are a forger--I can send you to prison for twenty years, and I will do so unless you do so-and-so for me." He did not know how Hannibal meant to use his information. He was afraid to broach the matter to him. He could only wait and suffer; and suffer he did, as a proud-spirited, high-minded man who has made an error must suffer, when such a sword hangs over his head, ready at any moment to fall.

As Walker Boggs had said, Mr. Fern was not by nature a business man. After the former's retirement from active participation in the concern there was a series of losses. When Mr. Fern took his pen and began to imitate the signature of his late partner on a sheet of paper, nothing but some such course stood between him and bankruptcy. He felt certain that if he could tide over twenty-four hours he would be saved. Before he left his office he had made a note, written Mr. Boggs name across the back of it, and raised money thereon.

He did this many times afterwards, but finally, when he again wanted a name to save himself with, he dared not use this one. Boggs had called in to remark that he should withdraw the capital he had lent as soon as the term arranged for had expired. The sum was already infringed upon, had the investor known it. The next name used was that of Archie Weil. Archie had been to the house a good deal to see Millicent. Mr. Fern believed there was a love affair between them, and he caught at the straw of possible protection in case of discovery. The forgeries became numerous, and the total amount on that day when the passage of a new tariff saved the venturesome speculator, was very large. Hannibal was at this time in foreign parts, or at least so the merchant supposed. He soothed his conscience with the reflection that this additional wrong act would enable him to right the others that preceded it. And things might have gone well had not the negro returned, consumed with the love he bore the younger daughter, and had not his love turned to vinegar by her contemptuous rejection of his advances.

An hour after Daisy left him, Hannibal had made up his mind to be revenged. He had faltered a little in the meantime, asking himself what good it would do to bring disgrace on the head of this poor old man, but his injuries were too strong for mercy. He was despised by them all; he would show them that, black as he was, his ability to hurt was no less strong than theirs. Roseleaf had made the first impression on that young heart he himself had craved. It remained to be seen whether he would wed the daughter of a convict. There would be something pleasant, too, in disgracing Millicent, who had once placed herself in a position where he could have blasted her reputation forever, and had afterwards dared to treat him as if he were the dirt beneath her shoes. Yes, Hannibal decided, he would go to Mr. Weil and Mr. Boggs, and show them the way this man had used their names, hawking them in the public market without their knowledge.

When Hannibal reached the Hoffman House and inquired for Mr. Weil, he was told that he was absent. An hour later he received the same answer. A visit to the residence of Mr. Boggs elicited a reply precisely similar. In fact, the day wore away and evening arrived before he found them.

In the meantime, Mr. Weil had not been idle. While Daisy and Shirley Roseleaf were tearfully exchanging their explanations, he sent a messenger to Mr. Boggs, asking that gentleman to come to him without delay. An hour later the messenger arrived with the gentleman, and having engaged a room for temporary use, and seen to it that Roseleaf wanted nothing at present but his fair nurse, Archie pulled Boggs in and locked the door securely.

"What's all this?" exclaimed Boggs. "You look and act as if there was the devil to pay."

"There is," was the short answer. "I want you to do one of the most creditable acts of your life. I want it as a personal favor, and I'm going to have it, too."

Mr. Boggs crossed his hands over his paunch and waited for further information.

"Are you a first-class liar?" was Mr. Weil's next question. "Could you, in an emergency, do yourself justice as an eminent prevaricator? Are you able, for a certain time, to banish truth from your vicinity?"

Mr. Boggs remarked, in response to these astonishing suggestions, that he could tell much better what his friend was about if he would drop metaphor.

Mr. Weil hesitated. He saw no way but to trust this man with the facts, and yet he dreaded the possibility that he might prove obstinate.

"By-the-way," he said, as if to change the subject temporarily, "have you been out to see Fern lately?"

Mr. Boggs shook his head.

"You ought to," said Weil. "He's improved a thousand per cent. in the last few weeks. His financial luck has made a new man of him."

"I'm glad of that," responded the other. "And I'm glad too that I've got my money out of his firm, for I had a strong suspicion at one time that he was running pretty close to the wall."

Mr. Weil nodded to show that he believed this statement, and then grew sober.

"Sometimes, when men get into a tight place financially," he said, "they do queer things. Supposing I should tell you that Mr. Fern had endorsed checks and notes in a way he was not authorized to do?"

The stout man opened his eyes wider.

"That would be a piece of news," he answered. "But, if he did, he's made it all right by this time, of course, and nobody is the loser."

Mr. Weil drew himself up in his chair, as if righteously indignant.

"Do you think that is enough?" he demanded, raising his voice. "By Gad, supposing I tell you my name was one of those he monkeyed with!"

The other did not seem much perturbed.

"If the paper is all in, I wouldn't make a fuss about it, if I were you," he replied. "Fern is a good fellow. He has gone out of business, and I hope he'll never go in again. Take my advice, if you have learned anything to his discredit, and keep it to yourself."

Weil could hardly control himself.

"Do you think I intend to let him forge my name on his notes and checks and not put him under arrest!" he cried; "when the proofs are beyond question?"

Mr. Boggs bowed and said he meant that, exactly. He further remarked that he was astonished that his friend had any other idea in his mind. The Fern family was one in which he had been favorably received and he ought to do everything possible to prevent harm to any of its members. As he proceeded in this vein, Mr. Boggs grew so earnest that he did not notice the broad smile of happiness that was creeping over the face of his companion, and was not prepared to find a pair of manly arms clasped around his neck.

"You--you!" Archie Weil was trying to say. "You dear, kind, sensible fellow. You've made me the happiest man on earth! Of course _I_ wouldn't trouble Fern, but I was afraid _you_ would. He used your name as well as mine, the rascal! Everything is paid up, and all the trouble now is that a miserable scamp has got hold of some of the paper and wants to blackmail him. And what I called you here to-day for is to get you to agree--with me--to acknowledge every scrap of that paper as being our own!"

The sudden change was more than Mr. Boggs could bear for a moment. He sat, to use a common expression, "like a stuck pig," staring at Archie.

"You remember the nigger that worked for Fern," explained Mr. Weil. "He got hold of some of these notes and checks, in Fern's office, and is coming to look us up to-day, for the purpose of having his employer arrested. A nice game, eh? But we will foil him, won't we? We'll show him a trick worth several of his! He's probably gone to the Hoffman House and he'll hang round till he finds me. I'll send word that I am to be home this afternoon at five. You will be there with me. We'll tackle him together. When he tells us that he has some forged paper in his possession we'll act astonished and enraged; we'll ask him to show it to us; and when we've got it all in our hands we'll say the signatures are our own, and kick him down stairs. Are you with me, Walker? Is it a go, old boy?"

The agreement was made without more ado. Mr. Boggs began to see the humorous element in the affair, and actually came nearer laughing than he had done since the day he discovered that the size of his waist placed him out of the list of eligible "mashers."

When everything was settled, Mr. Weil excused himself for a few moments, while he tiptoed to Roseleaf's door and knocked. Daisy came to open it, and when she saw who the visitor was she blushed charmingly.

"Come in," she said. "I am sure both of us are glad to see you."

Shirley's eyes met those of his friend with a strange expression. He knew now that all his suspicions were unfounded, that Weil had proved himself noble and true. But the apologies that he owed could not be suitably made in the presence of a third person, and he made no reference to them. His changed appearance was enough, however, for Archie. The reconciliation with the girl of his heart was perfect, and the happiness that shone from their faces repaid their good friend for his sacrifice.

"I think I ought to take Miss Daisy to her train now," said Archie, after the exchange of a few ordinary remarks. "She can come to see you to-morrow again, and before many days we will have matters arranged with pater familias, so that Shirley can go out to Midlands in his proper capacity. Oh, you need not redden, little woman! The love you two have for each other does both of you credit."

Returning to Mr. Boggs, for the sake of allowing the young couple a few minutes for their good-bys, Archie dismissed that gentleman with the understanding that not later than half-past four he would join him in his room at the Hoffman House. Soon after he escorted Miss Fern to her station, and before he left the building Archie sent a dispatch to her father, asking him to come to the city and meet him at his hotel at four that afternoon.

Everything worked to a charm. Mr. Fern arrived at the time designated and went promptly to Mr. Weil's apartments. A brief explanation of what was about to occur threw the wool merchant into a state of extreme agitation, but he was assured that the last particle of danger to himself would be removed before he left the Hoffman House. He was asked to step into an inner room of the suite, the door of which was to be left ajar, and to make no move unless he was called.

Mr. Boggs came at his appointed hour, and Hannibal soon after. Delighted to find both gentlemen--accidentally, as he supposed--the negro began without delay to explain the cause of his visit. He stated the manner in which he had discovered the forgeries, and said he thought it only his duty to let the facts be known.

Messrs. Weil and Boggs exchanged glances of well-simulated surprise as the discoverer proceeded.

"How long is it since you first knew of this matter?" asked Mr. Weil, when Hannibal came to a pause.

"Something like eighteen months."

"And you allowed this swindle to go on all that time without saying a word!" said the questioner. "I am surprised, when I remember that for a long time you saw me almost daily."

"That is true," was the quiet response. "I could not easily bring myself to disgrace one whose bread I was eating. But that does not matter now. I have here a number of notes on which Mr. Fern has forged both of your names. The law will hold him just as strongly as if I had exposed him at the time."

He exhibited a package of papers, and unsuspiciously passed them to the two gentlemen. Undoing the band Archie Weil spread the documents on the centre table and went over them carefully with Mr. Boggs, separating those which bore their several names. A close perusal of all the notes followed, and finally Mr. Weil looked up and asked if there were any more.

"No, those are all," said Hannibal. "I believe there are thirty-six of them."

Mr. Weil consulted in a low tone with Mr. Boggs. They seemed puzzled over something.

"If these are really all the notes you have," said Archie, "there has been a great mistake on your part. These endorsements are genuine in every case. Where are the forged papers of which you spoke?"

The negro stared with all his might at the speaker.

"Genuine!" he repeated.

"Undoubtedly, as far as my name is concerned. I have lent my credit to Mr. Fern for a long time."

"That is equally true of myself," spoke up Boggs, slowly. "I wrote every one of these signatures and I am willing to swear to them."

Hannibal's eyes flashed with baffled rage. He had been trapped. These men had conspired to save his late employer from his clutches. They had lied, deliberately, and he was powerless against their combined assertions, although he knew the falsity of all they said.

"You will be as glad as we to learn the truth," said Archie, in a softly modulated voice. "It would have grieved you to know that your kind employer had made himself amenable to the criminal law. Your only object in this matter was to ease your conscience, and do justice. There is nothing, now, to prevent your returning at your earliest convenience to France."

The negro rose and took up his hat.

"This is very nice," he growled, "but I want to tell you that you are not through with me yet."

Mr. Weil rose also.

"I trust," he said, "that you are not going to be impolite. I certainly would not be guilty of discourtesy to you. But let me assure you of one thing: If you ever, hereafter, annoy in the slightest degree my friend, Mr. Fern, or any member of his family, you will wish heartily that you had never been born. We can spare you now, Mr. Hannibal."

With the last words, Archie waved his hand toward the door, and without further reply than a glare from his now blood-shot eyes, the African strode from the apartment.

"I want you to take a ride in the Park with me, for an hour or so, and then we will return here for dinner," said Mr. Weil to Mr. Boggs.

He did this to allow Mr. Fern to leave the house without Boggs' knowing he was there, and also to avoid a meeting that he felt would be too full of gratitude to suit his temperament just then.

CHAPTER XXI.

"WE WANT MILLIE TO UNDERSTAND."

Millicent Fern had been so busy on her second novel that she had hardly noticed the prolonged absence of Shirley Roseleaf from her father's house. Her first story was selling fairly well and she had received a goodly number of reviews in which it was alluded to with more or less favor. Not the least welcome of the things her mail brought was a check bearing the autograph of Cutt & Slashem, that tangible evidence which all authors admire that her efforts had not been wholly in vain. She had put a great deal of hard work into her new novel, and felt that, when Mr. Roseleaf added his polish to the plot she had woven, it would make a success far greater than the other.

Millicent thought she understood the young man perfectly. To her mind he was merely awaiting the moment when she was ready to name the day for their marriage. To be sure he had not asked her to wed him, but his actions were not to be misunderstood. She would accept him, for business reasons, and the romance could come later. Together they would constitute a strong partnership in fiction. While she was wrapped up in her writing it was quite as well that he remained at a respectful distance. Between her second and her third story she would have time to arrange the ceremony.

When Roseleaf made his next appearance at dinner, in the house at Midlands, Miss Fern smiled on him pleasantly. She remarked that he lacked color, and he replied that he had been suffering from a slight illness. Then she spoke of her new story, revealing the plot to a limited extent, and said it would be ready for him in about two weeks. The astonished young man saw that she considered his services entirely at her disposal, without question, whenever she saw fit to call upon them. He talked it over with Daisy.

"You know," stammered the girl, "that Millie thought you were in love with her. That would account for everything, wouldn't it?"

"But where did she ever get that idea!" he exclaimed, desperately.

"She says you tried to put your arm around her."

"Just to practice. Just to learn what love was like. I told you how ignorant I was, the same as I did her. Archie said she would show me, but it didn't amount to anything. It was only when I asked you, Daisy, that I began to understand. Do you remember how you stood on your toes and kissed me?"

The girl bade him be quiet and not get too reminiscent, but he would not.

"It taught me all I needed to know, in one instant," he persisted. "Ah, sweetheart, how much happiness and suffering I have had on your account!"

He stooped and kissed her tenderly as he spoke.

"And after this it will be happiness only," she whispered.

Another kiss answered this prediction.

"What can I do if she asks me to rewrite the whole of another novel?" asked Roseleaf, with a groan.

"I think you might find time to oblige her," said Daisy. "But you ought to explain things--you ought not to let her misunderstand your position any longer."

He said that this was true, and that he would act upon the suggestion. He had her father's consent, and nothing could stand in the way of his marriage to Daisy before the year ended. It was not right, of course, to go on with the implication of being engaged to both the sisters.

"But I wish I could escape doing that writing," he added. "I hate fiction, any way; I have been at work on one of my own that I fear I never shall finish. There is much sadness in novels, and I like joy so much better. I believe I shall abandon the whole field."

This she would not listen to. She said her husband that was to be must become a famous writer, for she wanted to be very proud of him. And Mr. Fern came in to the room, and having the question put to him, decided it in the same manner, as he was sure to do when he learned that his younger daughter held that opinion.

The retired merchant bore the appearance of a man from whose shoulders the severe burden of a great weight had fallen. The tiger that had crouched so long in his path, ready at any moment to spring, had been vanquished. Beyond the profound humiliation of knowing that his sin was exposed to the gaze of two of his intimate friends, he had no cause for present grief. Both of them had proved friends indeed, and nothing was to be feared from any quarter. Hannibal had disappeared immediately after the interview at the Hoffman House, and it was supposed had gone back to France.

There was to be no haste about the wedding, after all. Now that the young couple felt perfectly sure of each other they were more willing than they had been to wait. The freedom that an understood engagement brings to Americans was theirs. If Millicent had only known the true condition of affairs, and was content with them, they would have been perfectly satisfied.

An old story tells how a certain colony of mice came to the unanimous conclusion that a bell should be hung around the neck of a cat for which they had a well-defined fear; and it also relates that none of the rodents were willing to undertake the task of placing the warning signal in the desired position. Both Shirley and Daisy wished heartily that Millicent could be told the exact condition of their hopes and expectations, but neither had the courage to inform her. Many of their long conversations referred to this matter, and one day, when they had discussed it as usual, Daisy hit upon a bright idea.

"You don't suppose, do you, that Mr. Weil would tell Millie for us? He has done so many nice things, he might do one more."

Roseleaf wore a thoughtful expression. He realized how much Archie had already done for him--realized it more fully than Daisy did; but he said the matter was worth thinking of. He wanted very much to have it settled.

"Would--would you--ask him?" he stammered. "He would do anything for you."

"Yes," she responded, softly, "I will ask him. But we had best be together. I do not want to broach the matter unless you are there."

In a few days the opportunity came. Mr. Weil heard the voice he loved best explaining the situation.

"We want Millie to understand," said Daisy. "If she--if she still likes Shirley herself, there may be an unpleasant scene, and you will see how difficult it is for either of us to tell her. But you, who have done so many kindnesses for us, could convey the information to

her without the diffidence we should feel. Will you, dear Mr. Weil?"

And Archie said he would, and that it would be a pleasure to him. And a bright light illumined the faces of the young people, as another stone was rolled out of the pathway their feet were to tread.

Mr. Weil did not know how to approach his subject except by a more or less direct route. One day he was talking with Miss Fern about her new novel, and she spoke of Mr. Roseleaf in connection with its nearness to the required revision.

"I don't know as Shirley will find time to help you out," he replied. "He is so busy just now with Miss Daisy."

She did not seem to comprehend him in the least.

"Oh, he is merely filling in the time, as a matter of amusement," she answered. "When I am ready he will be."

He looked at her earnestly.

"Is it fair to speak of love-making as a matter of amusement, Miss Fern?"

"Love-making? Is he, then, practicing for his novel with Daisy, also?" she inquired. "I am afraid he will get erroneous views of love in that quarter. She is such a child that she can have little knowledge of the subject."

She had evidently no suspicion of the truth, and he determined to become more explicit.

"Perhaps that is exactly what he wishes," said he. "The virgin heart of a young girl certainly affords tempting ground for the explorations of a novelist."

For the first time she showed a slightly startled face.

"I trust you do not mean that Mr. Roseleaf is deceiving my sister with pretended affection?" she said. "I did not think him that kind of man. If he is making love to her, as you call it, surely she understands that it is only for the purposes of his forthcoming novel?"

Mr. Weil drew a long breath.

"Is it possible," he asked, "that you do not know him better than even to hint that suspicion? Shirley Roseleaf is honor personified. He would not lead any woman to believe him her lover unless he truly felt the sentiments he expressed."

Miss Fern looked much relieved.

"I am glad to hear you say so," she replied.

Archie was plunged into a new quandary. He had evidently made no progress whatever thus far.

"No," he continued, slowly, "he has not deceived Miss Daisy. His love for her is as true as steel. I understand their engagement is to be announced in a few days."

If he had known the pain that these words would bring to their hearer--if he had foreseen the anguish that was portrayed on that brow and in those eyes--friend as he was of the young couple who had set him to this errand, he would have shrunk from it. Millicent made no verbal reply. Spasms chased each other over her white face. She seemed stricken dumb. Her hands, lifted to her forehead, trembled visibly. And Mr. Weil sat there, uncertain what to do, as silent as herself.

Gradually the force of the storm passed, and Miss Fern staggered faintly to her feet. Mr. Weil offered to support her with his arms, but she refused his aid with a motion that was unmistakable. She was making every effort to conceal her agitation, and she dared not trust herself with words. After taking a weak step or two, and finding that she could not walk unassisted, she rested herself upon the arm of a large chair, and signed to him to leave her. Much mortified, but knowing no other course, he bowed profoundly and obeyed the signal.

The next morning he received the following letter at his hotel:

"MR. A. WEIL:--SIR: If you are in any respect a gentleman--which I may be excused for doubting--you will not allude in the presence of any one to the exhibition I made to-day. Had I had the least preparation I could have controlled myself. You adroitly took me at a complete disadvantage, and you saw the result.

"I leave to-morrow for a new home. Never again shall I live under the roof of those who have betrayed me. Do not think I shall succumb to grief because of my sister's conduct. She is welcome to her victory. No answer to this is expected. Yours, M. A. F."

Luckily Archie had escaped from Midlands without meeting either Daisy or Roseleaf, and he obeyed as strictly as possible the injunction he received from the elder sister. All he would say was that he had informed her of the engagement and that she had made no reply. When he was told a day or two later that Millicent had left the house, he merely remarked that he was not much surprised, as she was a girl of strong will and usually did about as she pleased.

Mr. Fern, at first much distressed over his daughter's action, grew reconciled when he thought of it more at length. He sent a liberal allowance to her, which she did not return, and made arrangements by which she could draw the same sum at her convenience at a bank in the city.

CHAPTER XXII.

WHERE WAS DAISY?

The wedding was arranged to occur in the month of October, and the preparations, so dear to the hearts of all young women, were pushed with dispatch. There were to be no ceremonials beyond the ones necessary, and the company to visit the nuptials was limited to a dozen of the family's most intimate friends. When the evening came, Walker Boggs was on hand, wearing an extra large waistcoat, and a countenance such as would have best befitted a funeral. Lawrence Gouger came, his keen eye alert, foreseeing several chapters in the great novel that Roseleaf was writing, based on the experiences of the next few weeks. But Archie Weil wrote a note at the last minute, regretting that a business engagement that could not be postponed had called him to a distant point, and sending a magnificent ornament in large pearls for the bride, to whom he wished, with her husband, all health and happiness.

Mr. Gouger had had many arguments with Mr. Weil, in opposition to the early date set for the wedding. He had shown that, according to the best models, the hero of Roseleaf's novel--which was practically the young man himself, ought to pass through some very harrowing scenes yet before his wedded happiness began. He feared an anti-climax, and was apprehensive that the wonderful romance would lie untouched for long months while Roseleaf sipped honey from the lips of his beloved. And he acted as if these things were entirely at the disposal of Mr. Weil--as if the young couple were mere marionettes whose actions he could control.

"You could put it off if you liked," Gouger said, complainingly. "You could introduce other elements that would be the making of the novel, and you ought to do it. They should not marry before next spring, at the earliest. You run the risk of spoiling everything."

"Good God!" cried Archie. "You talk like a fool. I would have postponed it forever, if I could, and you know it. But she loves him, and there is nothing to be gained by delay. Confound you and your old novel! With the happiness of two human beings at stake you talk about a piece of fiction as if it was worth more than a blissful life!"

Gouger straightened himself up in his chair.

"It is worth a hundred times more!" he answered, boldly. "A novel such as Roseleaf's ought to be would give pleasure to millions. But I see you are bound to have your way. The only hope left is that there will be trouble enough after marriage to spice the story to the end. A milk and water, nursing-bottle existence for them would make all the work already done on this manuscript mere wasted time!"

Weil turned from his friend in disgust. Could the man talk nothing, think nothing, but shop?

But Archie did not come to the wedding. He knew the final strain would be more than he could bear. It was one thing to sacrifice the woman he loved and quite another to see her given into the arms of the rival he had encouraged. One may do the noblest things, at a respectful distance, and find himself physically unable to view them at greater proximity.

Of course Shirley Roseleaf was almost too happy to breathe. But even the happiest of lovers somehow manage to inhale a sufficiency of oxygen to keep life in them, though they have no knowledge of the process by which this is accomplished. He had seen several of his productions in type, some in the leading magazines, and he had a permanent position now on the staff of a great periodical. When the month he had allowed himself as necessary for a wedding journey was ended, he would settle down to work, and he knew no reason why he might not make a success in his chosen field. And there was Daisy--always Daisy--he would

never again be separated from Daisy! Who that has loved and been loved can doubt the perfect content of this young man?

The saddest face at Midlands was that of Mr. Fern, who failed in his best attempts to appear cheerful. He was not sorry that his daughter was to be married, he would not have put a single obstacle in her way; but she was going from him, and the very, very dear relations they had so long sustained would never be exactly the same again. It was the destiny of a woman to cleave to her husband. He found no fault with the law of nature, but he had clung to Daisy so devotedly that he could not welcome very sincerely the hour that was to take her away.

The marriage was to be early in the evening. Everything was ready, even to the trunks, filled with traveling and other dresses. The night was to be passed at the Imperial Hotel in the city, and the journey proper to be begun some time on the following day.

On the most momentous morning of her life, Daisy Fern announced that she had an errand to do in the city and would return shortly after twelve o'clock. As she was so thoroughly her own mistress nobody thought of questioning her more particularly. But twelve o'clock came, and one o'clock, and three, and five, and she neither was seen at Midlands nor was any message received from her.

By the latter hour Mr. Fern was in a state of excitement. The entire house was in an uproar. The servants were catechised, one by one, to see if perchance any of them could guess the young lady's destination. Word was sent by telephone to various places in the city, asking information, but none was received. She had left the house, ostensibly to go to New York, and nothing could be learned of her from that moment.

As Mr. Roseleaf was not expected until some time later, Mr. Fern went at last to the city and sought the young man at his rooms. He found him in the company of Lawrence Gouger, dressed for the ceremony, and impatient for the arrival of the hour when he should start for his bride's abode. It may be conceived that the news Mr. Fern brought was not the pleasantest for him.

"You--you have not seen Daisy?" came the stammering question, as the father paused on the threshold of Roseleaf's room.

"To-day? Why, certainly not!" was the stupefied answer. "I was just about to start for your house."

Mr. Fern sank upon a sofa just inside the door.

"Something--has--happened!" he groaned. "Ah, my boy, something has happened to my child!"

Roseleaf looked at Mr. Gouger, who in turn looked at Mr. Fern.

"She--went away--this morning--on an errand," enunciated the father, slowly, "saying--she would return--at noon. And--that is the last we--have seen--of her. Oh, it seems as if I should go mad!"

It seemed as if Shirley Roseleaf would go mad, too. He looked like one bereft of sense, as he stood there without uttering a word.

"Perhaps she has returned since you left home," suggested Mr. Gouger, on the spur of the instant. "Don't lose heart yet. Let me send to a telephone office and have them inquire. You have a 'phone in your house, have you not, Mr. Fern?"

The father bowed in reply. He was too crushed to say anything unnecessary. Touching a button, Mr. Gouger soon had a messenger dispatched for the information desired, and in the meantime he tried, by suggesting possibilities, to soothe the two men.

"You shouldn't get so excited," he protested. "There are a hundred slight accidents that might be responsible for Miss Daisy's delay. Perhaps she has met with an insignificant accident, and the word she has sent to her father has gone astray--as happens very often in these days. That would account for everything. Or she may have taken the wrong train--an express--that did not stop this side of Bridgeport, and hesitated to telegraph for fear of alarming you. 'Don't cry till you're hurt' is an old proverb. Why, neither of you act much better than as if her dead body had been brought home!"

They heard him, but neither replied. They waited--it seemed an hour--for an answer to the telephonic message, and it came, simply this: "Nothing has been heard as yet of Miss Fern."

The thoroughly distressed and disheartened father shrank before the gaze of the lover, when this news was promulgated by Mr. Gouger.

"What swindle is this?" were the bitter words he heard. "Have you decided on another husband for your daughter, and come to break the news to me in this fashion?"

Mr. Gouger interfered, to protect the old man whose suffering was evidently already too acute.

"Hush!" he exclaimed. "Can't you see that you are killing him? Be careful!"

Roseleaf waved him back with a sweep of his arm.

"Your advice has not been asked," he replied, gutturally. "I can see some things, if I _am_ blind. That girl has gone to the man she loves--the man he," indicating the father, "wanted her to marry. He is rich, and I am poor, and he has won! It is plain enough! And he pretended, day by day, to my face, that he had given her up for my sake; and she put her arms around me, and beguiled me into confidence, in order to strike me the harder at the end. Well, let him have her! I wouldn't take her from him. But there's an account between us that he may not like to settle. When you see your friend, tell him that!"

Mr. Fern heard these terrible sentences like a man in a dream. It could not be Roseleaf that was uttering them--the man to whom his young daughter had given the full affection of her innocent heart! He was mad to talk that way. Mad! mad!

"You will repent these rash statements," said the old gentleman, rising faintly from his seat. "You will repent them, sir, in sackcloth. I wish with all my heart that Mr. Weil was here, for he would at least try to help me find my child."

Mr. Gouger suggested that Mr. Weil would be at Midlands soon, as he had an invitation to the wedding.

"No," replied Mr. Fern, chokingly. "I received word from him to-day that he could not attend. He is out of the city."

Roseleaf gave vent to an expression of nausea.

"Are you yourself deceived?" he exclaimed. "He will not attend _my_ wedding; certainly not! He is attending _his own_. If, indeed, he does not compass his ends without that preliminary."

Weak and old as Mr. Fern was he would have struck the speaker had not the third person in the room interfered.

"Do you dare to speak in that manner of my daughter!" he cried. "Must you attack the character not only of my best friend but of my child as well? I thank God at this moment, whatever be her fate, that she did not join her life to yours!"

With a majestic step he strode from the presence of his late prospective son-in-law. Gouger, with a feeling that some one should accompany him, followed. But first he turned to speak in a low key to the novelist.

"Do not go out to-night, unless you hear from me," he said, impressively. "This may not be as bad as you think, after all. I will go to Midlands and return with what news I can get. Don't act until you are certain of your premises."

The young man was removing his wedding suit, already.

"I shall not go out," he responded, aimlessly.

"You might write a few pages--on your novel," suggested the critic, as he stood in the hallway. "There will never be a better--"

A vigorous movement slammed the door in his face before he could complete his sentence.

Hastening after Mr. Fern, Gouger accompanied him home, where the first thing he heard was that there was still no news of the missing one.

CHAPTER XXIII.

AN AWFUL NIGHT.

It was an awful night for Wilton Fern. The presence in the house of Mr. Gouger and Mr. Boggs aided him but little to bear the weight that pressed upon his heart. It was better than being entirely alone, but not a great deal. Together they listened whenever their ears caught an unusual sound. Twenty times they went together to the street door and opened it to find nothing animate before them.

Morning came and still no tidings. The earliest trains from the city were visited by servants, for the master of the house was too exhausted to make the journey. And at nine o'clock the gentlemen who had passed the night at Midlands took the railway back to New York, with no solution of the great problem.

Mr. Gouger had not been in his office an hour before the door opened and in walked Archie Weil. The critic started from his chair at the unexpected sight, and remarked that he had not expected to see his visitor so early.

"I presume you heard the news and came home at once," he added, meaningly.

Mr. Weil was pale, and wore the look of one whose rest has been disturbed.

"I don't know what you mean," he replied. "I was called away on business that I could not evade, and came back as soon as I could. I fear the Ferns thought it rather rough of me to stay away from the wedding, but I could not very well help it. You were there, of course. Everything went off well, I trust."

The speaker had the air of a man who tries to appear at ease when he is not. His voice trembled slightly and his hands roamed from one portion of his apparel to another.

"Then you have heard nothing!" repeated Gouger, gravely. "Prepare yourself for a shock. There was no wedding last night at the Ferns'. Miss Daisy disappeared yesterday morning, and has not been seen since."

If Mr. Weil had been pale before, his face was like a dead man's now. With many expressions of incredulity he listened to the explanations that followed. He declared that the occurrence was past belief, and that he could see no way to account for it. Clearly something had happened that the girl could not prevent. She would never have absented herself of her own accord. She loved the man who was to be her husband, and if she had wished to postpone her marriage she could have easily arranged it.

"I can think of nothing but a fit of temporary insanity," he added, with a sigh. "And Shirley--poor fellow--how does he take it? Completely broken up, I suppose?"

When he heard the attitude that Mr. Roseleaf had assumed, Mr. Weil seemed stupefied. Little by little Mr. Gouger revealed to him the answers that the young man had made to Mr. Fern, finally referring to the charge that he (Mr. Weil) had eloped with the bride. Archie's face grew more and more rigid as he listened, but the anger that the relator had anticipated did not show there.

"He is crazy," was the mild reply. "I will go and see him, at once, and enlist his assistance in the thorough search that must be undertaken. Come, Lawrence, leave your work for an hour and go with me."

Remembering his promise to return in the morning with the latest tidings, Mr. Gouger put on his hat and coat and entered the cab which his friend summoned. He felt that he was about to witness another chapter that would make most dramatic reading in that great novel!

"You had best let me go in first," he whispered, when they stood at Roseleaf's door. "He is in an excitable frame of mind, I fear."

For answer, Archie brushed the speaker aside and preceded him into the chamber, without the formality of a knock. Roseleaf lay before them in his easy chair, bearing evidence in his attire that he had not disrobed during the night. He greeted his visitors with nothing more than a look of inquiry.

"I only heard of your terrible disaster a few moments ago," said Mr. Weil. "I learn that Miss Daisy had not been heard from up to nine o'clock this morning. We must bring all our energies to bear on this matter, Shirley. Her father is unable to help us much. For all we know she may be in the most awful danger. Rouse yourself and let us consult what is best to do."

Incredulousness was written on the quiet face that looked up at him from the armchair.

"Why don't you tell us what you have done with her?" said the bloodless lips, slowly.

Mr. Weil trembled with suppressed emotion.

"This is no time for recriminations," he replied, "or I might answer that in a different way. We must find this girl. Before we go to the police let us consider all the possibilities, for they will deluge us with questions. Did any one think," he asked, suddenly, turning to Gouger, "of sending word to her sister Millicent?"

Mr. Gouger replied that they had done so. A servant had been dispatched early in the evening to Millicent's residence and had returned with the answer that she had heard nothing of Miss Daisy and did not wish to. She had previously sent a sarcastic reply to an invitation to attend the wedding.

"And she never came to comfort her father in his distress!" exclaimed Mr. Weil. "What a daughter!"

They could get nothing out of Roseleaf. He answered a dozen times that it would be much easier for Mr. Weil to send Daisy home or to write to her father that she was in his keeping, than to attempt the difficult task of deceiving the police, who would have enough shrewdness to unmask him.

"Then you will do nothing to help us?" demanded Archie, his patience becoming exhausted, though he kept his temper very well. "In that case we must lose no more time. Ah, Shirley! I thought you worthy of that angelic creature, but now--"

He checked himself before finishing the sentence, and went out into the hall.

"I think I had best go to Midlands and consult with Mr. Fern," he said to Gouger in a low tone. "There is a possibility that his daughter has returned since you came away. What an awful list of horrible thoughts crowd on one! If you can help me any I will send you word later."

When Mr. Weil was gone, Mr. Gouger opened the door and looked again into Roseleaf's room. The young man had not changed his position in the least.

"He has started for Midlands," he said. "What do you think of his explanation in regard to his absence last night?"

"I think--I know--it is a lie!" was the quick reply.

"You really believe she went away to meet him--and that he has passed the last twenty-four hours with her."

"Undoubtedly."

The critic waited a minute.

"Do you think they are married?" he asked.

Roseleaf closed his eyes, as a terrible pain shot across them. He wondered dimly why this fellow should delight in uttering things that must cause suffering. Gouger deliberated whether to say more, but thinking that he had left the right idea in the young man's mind for the purpose he had in view, he softly withdrew from the chamber and left the house. When Roseleaf looked up again, some minutes later, he was alone.

* * * * *

Mr. Weil's hand was grasped feebly by the owner of Midlands, when he came into the presence of the gentleman. Though completely exhausted Mr. Fern had not been able to sleep. He listened wearily while his caller suggested possibilities to account for his daughter's absence, but could not agree that any of them were probable. When the idea was broached of communicating with the police he shrank from that course, but finally admitted that it must be adopted, if all else failed. In answer to a hundred questions he could only say that he had no idea of anything that could make her absence voluntary.

"She loved her chosen husband devotedly," said the old man. "When she hears what I have to tell her she will hold a different opinion."

"Then," said Archie, ignoring the latter expression, "she must either be the victim of an accident, a fit of aberration, or--"

He could not bear to finish the sentence, but the father bowed in acquiescence.

Lunch was served and Mr. Weil sat down to it, trying by his example to persuade Mr. Fern to take a few mouthfuls. Neither of them had any appetite, and the attempt was a dismal failure.

"I leave everything to you," said the host, as Mr. Weil prepared to take his departure. "You are the truest friend I ever had, and whatever you decide upon I will endorse. But I have an awful sinking at the heart, a feeling that I shall never see my child alive. Do you believe in premonitions? I have felt for weeks that some misfortune hung over me."

Before Mr. Weil could reply a servant entered with a telegraphic message that had just been received. Tearing it open hastily Mr. Fern uttered a cry and handed it to his companion:

"I am alive and uninjured. Look for me to-morrow.--Daisy."

A gush of tears drowned the exclamations of joy that the father began to utter.

"Alive!" he exclaimed. "And will be home to-morrow! Ah, Mr. Weil, hope is not lost, after all. But why, _why_ does she leave me in my loneliness another night? Is there any way in which you can explain this mystery?"

Mr. Weil confessed his inability to do so. He tried, however, to show the father the bright side of the affair, and bade him rest tranquil in the certainty that only a few hours separated him from the child he adored. When Daisy came home she would explain everything to his satisfaction. In the meantime he ought to indulge in thankfulness for what he had learned rather than in regrets.

"Go to bed and get a good rest," he added. "I will make a journey to the telegraph office in the city and see if it is possible to trace this message. If I learn anything I will ring you up on the telephone at once. And remember, if you do not hear from me, there is a proverb that no news is good news. Daisy has promised to come home to-morrow. This is something definite. An hour ago we were plunged in despair. Now we have a certainty that should buoy us up to the highest hope."

Catching at this view of the case, Mr. Fern consented to seek rest and Mr. Weil took the next train to the city. Engaging a carriage he bade the driver take him with all speed to Mr. Roseleaf's residence. Notwithstanding the harsh manner in which he had been treated by his late friend, he wanted to be the first to inform him that Daisy had been heard from. He was smarting, naturally, under the imputation upon his own honor, and felt that the telegram in his hand would at least remove that suspicion.

"I couldn't help coming again, Shirley," he said, when he was in the presence of the novelist. "I know, despite the cruel manner you have assumed, that you still love Daisy Fern and will be glad to hear that she is safe from harm. Here is a telegram that her father has just received, stating that she is well and will be at home to-morrow."

His face glowed with pleasure as he held out the missive, but darkened again when Roseleaf declined to take it in his hand. The young man had not moved, apparently, from the chair in which he had been seen three hours before, and his expression of countenance was unchanged.

"Does she say where she passed the night--_and with whom_?" he inquired.

"No. But she says she is well and will return. Is not that a great deal, when we have feared some accident, perhaps a fatal one?"

The novelist uttered a sneering laugh.

"My God, Shirley, why do you treat me like this!" exclaimed Mr. Weil, excitedly. "I have been your friend in everything, as true to you as man could be! If I had done the dastardly thing of which you accuse me, why should I come to you at all? I could have taken my bride and gone to the other end of the earth. We need not have adopted these contemptible measures. But although I _did_ care for this girl--more than I ever cared or ever shall care for another--I knew it was _you_ she loved and I did all I could to aid you in your suit. Have you forgotten how I brought her here, as you lay in that very chair, and removed the misunderstandings that had grown up between you? As God hears me, I have no idea what caused her absence last night! I am going now to the telegraph office to trace, if possible, the message and find where she is at present, for I want to relieve her father's mind still more."

Roseleaf seemed partially convinced by this outburst. He left his chair, and began slowly to arrange his attire before the mirror.

"If you are sincere," he said, "I will accompany you. I will also do my best to discover the resting-place of this young woman. You must remain with me till she is found. If we do not see her before to-morrow morning, we will walk into her presence at Midlands together. Do you agree to this?"

"With all my heart!" was the joyous reply.

In ten minutes they entered the carriage at the door, and were driven to the station from which the telegram had been sent.

CHAPTER XXIV.

"THIS ENDS IT, THEN?"

There was nothing to be learned at the telegraph office. As near as could be remembered a boy had brought the message, paid for it and vanished. Only one discovery amounted to anything. The original dispatch was produced and proved to be in Daisy's handwriting. Roseleaf attested to this, and he knew the characters too well to be mistaken.

It was not advisable, in Mr. Weil's opinion, to go to the police, after the receipt of this word from the missing girl. It would only add to the notoriety of the family in case the press got hold of the news. But he did think it wise to go to see Isaac Leveson and find a man named Hazen, whose reputation as a detective was great. He could rely on the absolute silence of both of them. The ride to Isaac's was consequently made next, and by good fortune Hazen happened to be in. He listened gravely to the situation as it was outlined by Mr. Weil, but expressed his opinion that nothing would be gained by doing anything before the next day.

"That telegram is genuine," he said. "It follows that, unless she is detained forcibly, she will be at home to-morrow. The writing in this message is not like that of a person under threats, like one compelled to send a false statement. Your best way is to wait till she comes home, providing it is not later than she indicates, and hear her story. Perhaps it will explain the mystery. If she declines to do this, I will undertake to probe it to the bottom, if you wish."

Mr. Roseleaf took no part in this discussion. He was becoming convinced that Archie Weil was innocent of any complicity in this affair, but he was still disinclined to talk much.

"Where shall we go now?" he asked, when they came out of the restaurant.

"To the Hoffman House?" said Weil, interrogatively. "I believe with Hazen that we can do nothing to-night."

Very well, to the Hoffman House they would go. But they had not been in Weil's room five minutes when a boy came up with a telephonic message from Mr. Fern, stating that Daisy was safe at Midlands.

"Let us return without delay," said Weil, enthusiastically. "We should not lose a moment in removing this terrible cloud! Come, Shirley, we can catch the six o'clock train if we hasten."

Mechanically the younger man followed his companion through the hall, down the elevator and into a carriage at the door. Forty minutes later they alighted from the train at Midlands and were soon in the familiar parlor at Mr. Fern's. A servant who had admitted them, stated that Miss Daisy had been home about two hours but that she was now lying down. He would inquire whether she would receive the visitors.

What seemed an interminable time followed before the appearance of Mr. Fern and his daughter. When at last they came in together, leaning on each other, they were two as forlorn objects as one can imagine. The sight of his sweetheart's woe-begone face smote Roseleaf like a blow. He regretted to the bottom of his heart the cruel things he had thought and said of her.

"Daisy!" he exclaimed, stepping forward. "Daisy--my--"

He could get no further, for Mr. Fern, with a majestic motion of his hand, waved him back. The presence of the intended bridegroom was evidently not agreeable to the old gentleman.

"Sit down," said Mr. Fern, in a quavering voice, addressing himself wholly to Weil. "I telephoned _to you_ that my daughter had returned, for I knew _you_ would be anxious." He bore with special stress on the word "you." "I--I did not know that you intended to bring--any other person."

The allusion to Roseleaf was so direct, that he could not help attempting some kind of a reply.

"Who could be more anxious than I?" he asked, in a tone that was very sweet and tender; in vivid contrast, the old man thought, to his manner of the preceding evening. "No one has a greater interest to learn where she has been these long, desolate hours."

Mr. Fern abandoned his intention not to recognize the fact that Roseleaf was present, and turned upon him with a fierce glare in his sunken eyes.

"What right have _you_ to ask questions?" he demanded, pressing the trembling form of his daughter to his own. "You were the first to doubt her--even her innocence--this lamb that would have given her life for you only yesterday! She has returned to _me_, and henceforth she is _mine_! You could not have her though you came on your knees! You wish to know where she has been! Well, you never _will_! She will not tell you! It is her own affair. I am speaking for _her_ when I say that we desire no more of your visits to this house; we are through with you, thank God!"

It would be hard to tell which of the two men who listened to this was the more surprised. Mr. Weil felt his heart sink as well as did Roseleaf. Daisy clung to her father, without raising her eyes, and there was nothing to indicate that she disputed his assertions.

All was over between her and Roseleaf! Nothing could bring them together again! And she did not mean to divulge the cause of her remaining away a day and a night--that day and night that had been expected to precede and succeed her marriage.

Shirley rose slowly. He bent his eyes earnestly on the father and daughter, and his voice was firm.

"When one is dismissed, there is nothing for him but to go. I regret sincerely what I said last night, when the horror of this thing came suddenly upon me. I love you, Daisy, and I know by what you have told me so often that you love me. Are the foolish utterances of a distracted man to separate us forever? Conceive the agony I was in when at the very moment I was to start for my wedding I heard that my bride could not be found! If I had not adored you passionately would I have been on the verge of madness, saying and doing things without reason and excuse? I am ordered to leave you, my sweetheart, and if you do not bid me stay I can only obey the mandate. But I love you more at this moment than ever. All I ask to know is why you made this flight. If your answer is satisfactory there will be nothing on my part to prevent our marriage."

Archie Weil wished that he could have led this young man aside for just a moment, to show him that this was no time to make demands or exact conditions. He had no doubt that Daisy would explain everything, a little later. All that was wanted now was a revocation of the dismissal that Mr. Fern had pronounced. But he could not control the stormy ocean upon which they rode.

"You seem singularly obtuse," came the shaking voice of the old gentleman. "It is not for _you_ to dictate terms. We want to see you no more. Is not that clear enough?"

It certainly did not seem to be. Roseleaf lingered, wondering if these were really to be the last phrases he would hear in that house--in that very room where he had expected to hear the words that would make this sweet girl his for life.

"Daisy," he said, addressing himself once more to the silent figure, "I cannot believe you have so soon learned to hate me!"

She looked up at the solemn face and then dropped her eyes again.

"You will tell me where you were?" he pleaded. "It is my right to know."

She looked up again, with a wild horror in her features.

"Oh, I _cannot_!" she cried. "I _never_ can tell you. I never _can_!"

This statement shocked more than one person in that room. Up to this moment Mr. Fern had only understood, from the disjointed expressions of his daughter when she entered the house, that she did not wish to be questioned at that time. She had also explained to him that she had sent the telegram to make the coast clear of all except her parent, as she did not wish to meet others on her first arrival. When he had urged the duty of informing Mr. Weil she had acquiesced, not dreaming that Mr. Roseleaf would be in his company.

And now the old man felt that there was more in the answer she had given than he had suspected--something very like a confession of wrong. Mr. Weil felt this also, though he could not believe Daisy meant anything very heinous, and Shirley Roseleaf had a dagger in his breast as he reflected what interpretation might be given to her words.

"You _cannot_!" he repeated, ignoring the position in which he stood, and the presence of the others. "_You must!_"

Mr. Weil made haste to allay the storm that he saw was still rising.

"Let us be considerate," he said. "Miss Fern is not well. She is tired and nervous. To-morrow, when she has rested, she will be only too glad to tell us the history of her strange disappearance."

Mr. Fern looked uneasily from his daughter to the gentlemen and back again. He loved her dearly, and in this new danger that seemed to threaten her--danger perhaps even to her reputation--he wanted more than ever to shield her from all harm. Whatever had happened she was his child. She should not be baited and badgered by any one. But Daisy did not give him time to speak in her defense. She answered Mr. Weil almost as soon as the question left his lips.

"It cannot be. Not to-morrow, nor at any other time, can I tell you--or any person--anything. You must never ask me. It would merely give me pain, and heaven knows I shall suffer enough without it. Let me say a little more, for this is the last time I shall ever speak of these things. To you, Mr. Weil, I want to give my warmest thanks. You have been a true friend to me and mine. I do not mean to seem ungrateful, but I can tell you no more. And as for you, Shirley," she turned with set eyes to the novelist, "you know what we

were to each other. It is all ended now. Even if you had expressed no disbelief in me when you heard I had disappeared, it would be just the same. I hold no hard feelings against you, whatever my father may say. It is simply good-by. I shall not remain here much longer. Do not let this make you unhappy any longer than you can help. Now, you must excuse me, for my strength is gone."

Daisy had been much longer saying these things than the reader will be in perusing them. They had come in gasps, as from one in severe pain, and there were pauses of many seconds. When she had finished she rose, and leaning heavily on the feeble old man who escorted her, walked slowly out of the room.

"Well, this ends it, then," said Roseleaf, gloomily, following the fair figure with heavy eyes.

"No, Shirley, it does not; it _shall_ not!" replied Weil. "There is some dreadful mistake here, and a little time will clear it away. Have patience."

The novelist gazed at the speaker with a strange look.

"I have treated you like a brute," he said, slowly. "And I have treated Mr. Fern just as badly. My punishment is well deserved. But how can this puzzle of her absence be accounted for! Of course she would have had to satisfy me on that point before I could have married her."

The listener turned giddily toward a window.

"And yet you talk of love!" he said, recovering. "If that girl had done me the honor she did you I would not have _asked_ her such a question--I would have refused to _listen_ if it gave her the slightest pain to tell."

"I wonder she did not love you instead of me--for she did love me once," was the sober reply. "You would be a thousand times better, more suitable, than I."

There was no reply to this, but the two men walked slowly out of the house and to the station, where they took the next train for the city. On the way they talked little, and at the Grand Central Depot they separated.

Lawrence Gouger, who had in some strange way learned the news of Miss Fern's return, was awaiting Roseleaf in his rooms.

"Well, I hear the missing one is found," he said, as the novelist came in.

"Yes. She is with her father. But the peculiar thing is that she closes her lips absolutely about her absence. She not only refuses to speak now, but announces that her refusal is final."

Mr. Gouger hesitated what card to play.

"When does the marriage take place?" he asked, finally.

"With me? Never. I have been thrown over. Unless she had explained I could not have married her, any way; could I?"

The critic said he did not know. It would certainly have been awkward.

"And what is your theory?" he added. "Do you still lay anything to Weil?"

"No. I am completely nonplussed. But, never mind. It is over."

Roseleaf stretched himself, and yawned.

"Do you know, Gouger, I almost doubt if I have really been in love at all. I feel a queer sense of relief at being out of it, though there is a dull pain, too, that isn't exactly comfortable. I told Archie coming in that she should have married _him_. Upon my soul I wish she would. She's an awful nice little thing, and he has a heart that is genuine enough for her. Well, it's odd, anyway."

Astonishment was written on the face of the other gentleman as he heard these statements.

"You have at least gained one point," he said, impressively. "You have done the best part of the greatest novel that ever was written. Sit down as soon as you can and finish it, and we shall see your name so high up on the temple of fame that no contemporary of this generation can reach it."

"So high the letters will be indistinguishable, I fear," responded Roseleaf, with a laugh. "Where do you think I can get the heartiest supper in New York? I am positively starved. I don't believe I've eaten a thing since yesterday. If you can help me any to clear the board, let us go together."

This invitation was accepted, and Roseleaf began making a more particular toilet, taking great pains with the set of his cravat and spending at least ten minutes extra on his hair when he had finished shaving himself. He never had allowed a barber to touch his face.

"You won't lose any time on the novel, will you?" asked Gouger, anxiously, while these preparations were in progress. "You must take hold of it while the events are fresh in your mind."

"All right. I'll begin again to-morrow morning, and stick to the work till it's done. Where shall we go to supper? I'll tell you--Isaac Leveson's."

The critic could not conceal his surprise at the overturn that had taken place so suddenly in the young man's conduct. He stared at him with a look that approached consternation.

"You want to go there!" he exclaimed, unable to control himself. "You wish to dine with some pretty girl, eh?"

Roseleaf started violently.

"No, no! Not--yet!" he answered. "We can get a supper room without that appendix. I wish to be among men as mean as myself. I want to dine in a house full of people who would cut a woman's throat--or break her heart--and sleep soundly when they had done it!"

CHAPTER XXV.

AN UNDISCOVERABLE SECRET.

The Ferns did not stay much longer at Midlands. Crushed by their misfortunes neither cared to remain near the scenes that had made them so unhappy, nor where they would be likely to meet faces which kept alive their grief. The father knew no more than at first concerning the strange conduct of his daughter. She had told him nothing, and he had not asked her a single question. It was enough for him that she was bowed with a great trouble. His only thought was to mitigate her distress in every possible way. He was old--how old he had not realized until that week when she changed from a happy, laughing girl, standing at the threshold of a marriage she longed for, to a sombre shadow that walked silently by his side. He was the one who under ordinary circumstances should have received the care and the thoughtfulness--but everything was altered now. He guided and directed the younger feet, even though his own were faltering and slow.

Where they had gone no one seemed to know. Archie Weil received one brief note from Mr. Fern thanking him again in touching phrase for his many kindnesses, and saying that Daisy wished to add her most earnest wish for his happiness. The letter said they were going away for some time; but no more. He went one day to Midlands, hoping to learn something from the servants, and found the home entirely deserted. A neighbor told him a real estate agent near by had the keys, but that the place was neither for sale nor to rent. The agent, when found, could add nothing to his stock of information. Mr. Fern had merely mentioned that he was going on a journey and asked to have a man sleep at the house during his absence, as a precaution against robbery.

Mr. Weil saw Roseleaf two or three times, but the interviews were so unsatisfactory that he felt them not worth repeating. The novelist told him, as he had told Gouger, that he did not believe he had ever really loved Daisy, and was actually relieved now that the strain was ended. No persuasion could turn him from this statement, which he made rather in explanation of his present course than as a defense of it. Gouger had persuaded him that a love affair was necessary to develop his talents as a writer. Before he knew what he was about, such an affair had been precipitated upon him. He had felt its pleasures and pains to the uttermost, and now it was ended. All that was left as a result was a pile of MSS. which the critic pronounced wonderful. It was as if he had been in a trance, or mesmerized. Henceforth he would confine his writings to actualities or to poetic imaginings.

Talking with a man who held these views was not inspiring, to put it mildly, and Archie reluctantly gave up all hopes of making Daisy Fern a happy woman through this source. He had dreamed of unraveling the mystery that surrounded her and placing the young couple again in the position which, by some horrible mischance, had been so vitally changed in the short space of one day. Though he still loved Daisy with all the warmth of his nature, Archie had no thought of trying to win her for himself. She had given the

fullness of her innocent heart to Roseleaf and he did not believe she was one to change her affections to another so soon as this.

What had happened! What had happened! He thought it over day by day, and night by night.

Among the things he did before leaving New York--for he felt that a journey was necessary for him--was to seek out Millicent. He found the elder sister adamant to every suggestion of love for her family. She believed herself injured by them, and would have nothing more to do with either. As to the strange affair regarding Daisy she declared she had no theory. She did not think it sufficiently interesting even to try to formulate one. Her time was given to writing, and she had found another assistant that quite filled Roseleaf's place. The firm of Scratch & Bytum had accepted her latest novel, as she did not care to have anything more to do with Mr. Gouger.

When she mentioned the name of Roseleaf, Mr. Weil looked at her intently, and saw that she uttered it with the utmost calmness. She had hardened. Her fancied grievances had made her a different woman. She was cynical before, but now she was bitter. He would not have believed that such an alteration could have taken place in so short a time.

"What is your new book about?" he asked, trying to be polite.

"Crime!" she answered briefly. "It deals with the lowest of the low. It suits the mood I am in. I am writing of things so terrible that they will hardly be credited. To get at my facts I have to go into the most depraved quarters, and associate with the _canaille_. But I am going to make a hit that has not been equaled in recent years!"

He smiled sadly.

"Roseleaf had the same expectation," he said. "And yet he tells me that he is doing nothing on that wonderful tale over which I have heard Gouger rave so often. He has reached a point where he can go no farther, and unless he rouses himself, all he has done is merely wasted time."

Millicent closed her eyes till they resembled those of a cat at noonday.

"Keep watch for mine," she said. "It will be all I claim for it."

During the winter Mr. Weil was in California. As spring approached he returned to the East and visited a well known resort in North Carolina, where by one of those curious coincidences that happen to travelers, he found himself placed at table exactly opposite to Mr. Walker Boggs. The ordinary salutations and explanations followed, and then Mr. Boggs alluded to a more interesting subject.

"I think I can surprise you," he remarked, "by something that I learned the other day. Mr. Fern and Miss Daisy are living within five miles of here."

It was certainly news, and entirely unexpected at that. Those people might be in Greenland, for all Archie had known, and indeed he had supposed they were on the other side of the ocean. He listened with interest while Boggs went on to say that they had hired an old plantation house and grounds and were living a strictly secluded life. The narrator had seen them in one of his drives through the country, and had talked a few minutes with Mr. Fern; but--and he said it with a touch of pique--he had not been invited to visit them, nor had any apology been made for the neglect.

"By George, I thought it rather tough!" he added, "considering the way you and I got him out of that nigger's clutches."

"But you must remember what he has since endured," replied Archie, mildly.

"And there's been no explanation, of any sort?"

"Not the slightest. I'd give half I'm worth if I could get a clue. It worries me all the time. A life like that girl's ruined--simply ruined--in twenty-four hours, and nobody able to tell why! It's enough to drive a man frantic!"

Mr. Weil did not drive immediately to Oakhurst, which he learned was the name of the estate that Mr. Fern rented, but he enclosed his card in a hotel envelope and sent it there by mail, without a word of comment. If they thought it best to see him he would be glad to go, otherwise he would not intrude on their privacy.

Several days after--mails were slow in the South--an answer came. It briefly requested that Mr. Weil and Mr. Boggs, if the latter were still in town, would come to lunch on the following Wednesday. Boggs fumed slightly at the apparent difference made between him and Weil, but ended by going with his friend to Oakhurst.

Mr. Fern did not look any worse than when Archie had last seen him--indeed, if anything, he had improved in appearance. Time helps most griefs to put on a better face, and though the marks of what he had passed through would not be likely to leave his countenance, the utter hopelessness had in a measure disappeared. When Daisy came into the parlor, she also wore a mien not quite so crushed as when she left the room at Midlands with her words of farewell. Whatever her trouble was, it had not left her without something to live for. Her youth was doing its work, and it seemed to the anxious eyes of the onlooker that time would restore her nearly, if not quite, to her former radiance.

In the presence of Mr. Boggs, neither father nor daughter cared to discuss the past. They talked of the plantation on which they resided, of the pleasant drives in the vicinity, and of matters connected with the world in general, of which they had learned through the newspapers. But after the lunch was finished Archie found himself alone with Daisy, wandering through the extensive oak forest that gave the place its name.

"How long shall you stay here?" he asked her, as a prelude to the other questions he wanted to follow it.

"I don't know," she replied. "We shall probably go north during the warm weather, perhaps to the White Mountains."

He suggested that it must be rather lonesome at Oakhurst.

"Not for us," she said, quickly. "We are all in all to each other, and require no thickly settled community to satisfy us."

"Daisy," he said, after a pause, "there are things I must say to you, and I hope--with all my heart--you will find a way to answer them. In the first place, do you believe me, really, truly, your friend?"

She placed her hand in his for answer. The action meant more than any form of words.

"Then, tell me--tell me as freely as if I were your brother, your priest--why you stayed from home that night."

She withdrew the hand he held, to place it with the other over her eyes.

"It is impossible," she responded, with a gasp. "I told you that I never could explain, and I never can."

He looked sorely disappointed.

"I know no person on earth--not even my father," she proceeded, giving him back the clasp she had loosened, "that I would tell it to sooner than you. I have not given him the least hint. I know it leaves you to think a thousand things, and I can only throw myself on your mercy; I can only ask you to remember all you knew of me before that day, and decide whether a girl can change her whole mental and moral attitude in a moment."

He drew her arm caressingly through his, and breathed a sigh on her forehead.

"Not for one second have I doubted your truth!" he replied. "Believe that, Daisy, through everything. But I hoped for an explanation, for something that might assist me to punish the guilty ones, for such there must have been."

The face that she turned toward him was full of terror.

"Why do you say that?" she exclaimed.

"Because--"

"No, no!" she cried, interrupting him. "I do not want to hear you! We must not talk on the subject! There is nothing to be told, nothing to be guessed. This must be alluded to no more between us. It must end here and now!"

Thoroughly disappointed, he could do no more than acquiesce in the decision, and he indicated as much by a profound bow. Then she changed the conversation by an abrupt allusion to Roseleaf. When he told her, as he thought it wisest to do, how well the young man had borne his loss, she said she was very thankful. She had feared that he would suffer when he came to his senses, and it was a mercy that this reflection had been spared her.

He spoke of her sister, and of the call he had made upon her, suppressing, however, the disagreeable features of her remarks. Daisy said she had written twice and received no reply. It was evident that the separation in the family was final.

Toward evening the visitors drove back to their hotel, discussing the strange events that had occurred. Archie Weil did not close his eyes that night. The love he had tried to suppress broke forth in all its original fervor. He could not sleep with the object of his adoration five miles away, so lonely and so desolate.

* * * * *

The next day Mr. Boggs went away, and the next after this, a new visitor carried from the north. On coming out upon the veranda to smoke, Mr. Weil found Shirley Roseleaf there.

The surprise was mutual. Dying of ennui, Archie was glad even to meet the novelist. They talked for hours and afterward went to ride together. It appeared that Roseleaf had come south to get material for an article in the interest of the magazine on which he was employed.

One night, a week later, Roseleaf came into Weil's room and asked if he would like to take a moonlight canter with him. Glad of any means to vary the awful monotony Archie accepted, and the horses were soon mounted. Weil noticed that the route was in the direction of Oakhurst, but as he supposed Roseleaf knew nothing of the presence of the Ferns there, and as the family were doubtless abed at this time, he made no attempt to induce him to take an opposite course. It was a sad pleasure to pass within so short a distance of the roof that sheltered the one he loved best. On they rode, until they were within a mile of Oakhurst, and then Roseleaf drew his animal down to a walk. A little further he turned sharply into a by-path and alighted.

"What's all this?" asked Archie, stupefied with astonishment.

CHAPTER XXVI.

"I PLAYED AND I LOST."

Roseleaf did not immediately reply. He busied himself by tying his horse to a tree, taking particular pains to make the knot good and strong. He apparently wanted a little time to think what form of words to use.

"I want you to see something that will interest you," he said, finally, in the lowest tone that could well be heard. "If you will follow my example and accompany me some distance further I think you will be paid for your trouble."

Mr. Weil was pale. He felt certain that this strange visit had been premeditated, and that some revelation regarding the Fern family was about to be made. The dread of an unknown possibility for which he had no preparation--affecting the girl for whom he had so deep a love--unmanned him.

"I have a right to ask you to explain," he responded. "If your statement is satisfactory I will accompany you gladly. I do not see the need of any mystery in the matter."

The younger man drew a long breath and looked abstractedly at the ground for some moments. Then he spoke again:

"There are subjects," he said, "that one does not like to discuss. There are names that one hesitates to pronounce. If you will tie your horse and go with me, your eyes and ears will make questions unnecessary."

A momentary suspicion flashed through the mind of the other--a suspicion that he was being beguiled to this lonely spot from a sinister motive that boded his safety no good. But it was immediately dismissed, and after another second of delay, Archie slipped from his saddle and followed the example of his companion.

"Lead on," he said, laconically.

Without waiting for a second invitation, Roseleaf began to penetrate the wood. He found a footpath, after going a short distance, and crept along it slowly, taking evident pains not to make unnecessary noise. They were going in the direction of Oakhurst, and in less than ten minutes the chimneys of that residence could be seen in front of them. A little further and Roseleaf stopped, placing himself in the attitude of an attentive listener.

The silence was profound. A slight chill permeated the atmosphere, but neither of the prowlers felt cold. On the contrary, perspiration covered the bodies of both of them. Roseleaf went, very slowly, along the path, till he came near a fence, and then, diverging from it, drew himself quietly into a thick copse, motioning Weil to follow. Here the leader sank to the ground, with a motion

which indicated that the journey was temporarily, at least, at an end, and the second member of the party followed his example.

Half an hour passed with nothing to indicate the reason for these most peculiar actions. Half an hour that was interminable to Mr. Weil, torn with a thousand fears as to what it might all portend. At last, however, a faint sound broke the stillness. Some one was approaching. Roseleaf touched the shoulder of his companion to indicate the necessity of absolute silence.

Hardly ten feet away there passed a tall, athletic form, walking with a quick stride, as of one who has no suspicion that he is watched by unfriendly eyes. As the man's face became visible in the moonlight it was well that Roseleaf had a pressure of warning on his companion's shoulder. It was almost impossible for the latter to restrain an exclamation that would have ruined everything.

It was the face of Hannibal, the negro!

Horrified, Archie turned his bloodshot eyes toward Roseleaf. What could this strange visit of Hannibal's to that vicinity presage? Did he intend to murder the master of the house and abduct the daughter? What was he doing there, at an hour not much short of midnight? The terrors of his previous imaginings gave way to yet more horrible ones.

But the mute appeal that he shot at his companion produced no answer, except a resolute shake of the head--an absolute prohibition against the least sound or movement.

Hannibal reached the fence and, without any attempt at concealment, climbed over it into the enclosure where were situated the house and outbuildings of the Oakhurst estate. He acted like one who knows his ground and has no occasion to pick his way. He went, however, but a little farther in the direction of the residence. In a place where the shadow of a smokehouse hid him from the possible view of any one looking from the windows, he waited in an attitude of expectation.

The difficulty of controlling himself grew stronger and stronger for Archie Weil. He wanted to end this terrible doubt--to spring over that fence, pinion this fellow by the throat and demand what business he had on those premises at that hour. Roseleaf realized all that was passing in his mind, and kept his hand still on his shoulder, at the same time warning him by signs that the least movement would ruin everything. It seemed to Archie, when he thought it over afterward, that he had never endured such pain. He knew beyond reasonable doubt that Hannibal was awaiting some one by appointment. Who could it be? That was the stupendous question that Roseleaf might have answered in a whisper, but that he preferred for some mysterious reason his friend should discover in the natural course of events. And that course was horribly, torturously slow!

Everything has an end, and the dread of the watcher changed to another feeling as he saw distinctly one of the outer doors of the residence open and Daisy Fern's form come out. Without glancing to the right or the left she walked in the direction where the negro was waiting. For an instant, overcome by his apprehensions, Archie closed both his eyes in despair. The voice of Roseleaf was at last heard in his ear, a whisper nearly inaudible, conjuring him not to betray his presence whatever the provocation.

When Archie opened his eyes again he saw that Hannibal stood in an attitude of respect. When the girl approached he bowed, without offering any more intimate courtesy. Daisy had the look of one who has made up her mind to endure an unpleasant interview and desires to end it as quickly as possible.

"Well?" she said, in a low tone.

"I am going to-morrow," he replied, in a voice that shook with emotion.

"Yes."

"And, as I told you, I want to say good-by once more."

Archie breathed a trifle easier. He could not tell what fears had crowded upon him--they were indistinct in their horribleness--but some of them had already flown.

"You are as cold as ever," continued the rich voice of the negro, in a cadence that was meant to be reproachful.

"Do you think I could be anything else?" was the quick reply, as if forced from lips that had meant to remain silent. "Has your conduct been such as to make me like or respect you?"

The negro's eyes fell before her indignant gaze.

"No," he answered, humbly. "I expect nothing; I ask nothing. I can see my mistakes now. And yet, it would have been no different had I played the part of an angel toward you. The entire question with you was settled in advance by the fact that my skin was black."

The pressure on Weil's shoulder grew heavier, from time to time, as his companion realized his temptation to break from his covert.

"If it had been as white as any man's who ever lived," replied Daisy, boldly, "your conduct would have earned the contempt of a self-respecting person! A blackmailer, an abductor, a conspirator against the peace of mind of an old man and a young girl who never harmed you! I wonder you can talk of other reasons when you created so many by your wicked acts!"

Hannibal shrugged his shoulders.

"It is true, nevertheless," he replied. "I am a negro. In a moment of insanity I dreamed I was a Man! I dreamed I might gain for my wife a woman whose ancestors had been born in a more northerly clime than my own. To gain that end I took the only course that seemed open. I possessed myself of an influence that would make her father fear me. Well, I played and I lost--and then, like other players and losers, even white ones, I was desperate. You were to be married to another--a man I hated. Life had lost its only charm, I could not bear that you should be his bride. My torture was intense. I asked but for death."

These revelations, so novel to at least one of the listeners, smote him with terrific force.

"You asked for more!" said the girl, hoarsely. "You asked for my death as well as your own. And you wanted me to die in such a situation that all the world would say I had perished willingly with you. Could anything more cowardly be conceived! Was anything more dastardly ever devised! It was the morning of my wedding day; my father was waiting for me at home; my promised husband was preparing for the bridal; my friends were invited to the ceremony. What were all these to you? With Mephistophelian cunning you sent me a letter in another person's handwriting, saying that, if I would come to a certain address, and pay fifty dollars, several forged notes given by my father would be returned to me. You knew I would respond. You knew I would tell no one where I was going, as I did not expect to be detained more than an hour, and there was apparently the strongest reasons for secrecy. And when I was completely in your clutches you gave me the alternative of _marrying_ you--ugh!--or of taking the poison you had so carefully prepared. Oh, how _could_ you! how _could_ you, when you professed to _like_ me!"

There was a low gurgle in Archie Weil's throat, that he could not suppress. Fearful that it might be heard in that dead silence, Roseleaf shook his companion slightly. Mingled with his other emotions there now came to Weil a stupefied wonder at the apparent coolness of the novelist.

"When one is willing to die for his love, it should not be questioned," said the negro. "I could not have you in life--I wanted you in death. I wanted the world, which had despised me, to think a beautiful woman had preferred to die with me rather than marry a man she did not wish to wed. But why should we recall that dreadful day and night? You won the victory. You, with your superior finesse, triumphed over the African as your race has always triumphed over mine. I demanded love or death. You dissuaded me from both. And the next day I permitted you to depart, and saw vanish with you the last hope of happiness I shall ever feel."

The rich voice of the speaker broke completely at the close, but the girl who heard him seemed to feel no sympathy for his distress.

"Always yourself!" she exclaimed. "Do you ever think of the life you left to _me_--a life hardly more kind than the murder you contemplated. Before you opened the portals that you had meant for my tomb you made me swear never to reveal where I had passed those hours. Never, no matter what the provocation, was I to utter one word to implicate you in the tragedy that had ruined two households. _You_ were the one to be protected--_I_ the one to suffer! Had it not been for the sacrifice to my reputation in being found there with you dead--no explanation being possible from my closed lips--I would have accepted the alternative and swallowed the poison rather than live to bear what I do to-day!"

Weil closed his eyes again. His brain was swimming.

"And you are sure," asked the negro, after a pause, "that you have not violated that promise? You can still swear that you have never, even by a hint, given the least cause of suspicion against me?"

"Never!" said the girl. "I consider my oath binding, notwithstanding the manner in which it was obtained. You may live in what peace your conscience allows you, free at least from that fear."

The negro evidently believed her, for he heaved a sigh of relief.

"Well, good-by," he said.

"Good-by," she replied. "And--you are not to come again, remember. There is nothing to be gained from another meeting between us. If--if you want money--I can send it to you."

He lifted his head rather proudly at the last suggestion.

"I do not want any," he said. "I am not low enough for that. I took the sum from you to go to France, because I hoped--in my infatuation--that I could make myself something that you would not despise. If I had wanted money I could have got thousands out of your father, and I could still, notwithstanding the pretence of those men that they wrote the signatures I saw him forge. No, I mean to give you back what I had from you, if ever I can compose my mind enough to go to work and earn it. I have no ambition. I stay in my mother's cabin, day after day, unable to make the least effort. Perhaps I can do something--in time."

The negro took a step away, and then turned, as if unable to go so abruptly.

"Good-by," he said, again.

"Good-by," answered Daisy, impassively. "I want to tell you, now I think of it, where I got that $1,000 I gave you. It was lent to me by the man you hated so, Mr. Roseleaf."

Hannibal did not seem to care for this information.

"He did not lend it for any good-will to me," he replied. "I have heard, by-the-way, that he did not mind losing you--this man for whom you spurned a heart that worshiped your very footprints. I believe some day I'll take a shot at him."

The girl shuddered.

"It would be like you," she said, "if no one was looking, and he did not know of your presence. I don't believe, with all your claims, there is a manly trait in you."

The tall form drew itself up and the athletic arms were folded firmly.

"Take care!" said the red lips, sharply, and the ivory white teeth gleamed.

"Oh, I am not afraid," replied Daisy. "My maid is watching us from behind the blinds of my room. I told her my own story about why I was to meet you, but should harm happen to me the alarm bell would ring out."

Startled visibly at this information, Hannibal glanced in the direction indicated, and then began to take his departure in earnest.

"All right," he said, as he mounted the fence. "Keep your word and I'll keep mine. But if you play any tricks, remember that's a game for two."

The men could not arise without startling Daisy, who would undoubtedly have uttered a loud scream had they suddenly appeared before her vision. They saw her stand there for at least ten minutes, before she went into the house. When she was out of sight, Weil crawled into a safer place and rose to his feet.

"I am going to follow that cur!" he muttered, between his teeth.

"To-morrow is soon enough," was the calm reply of his friend. "I know where he lives."

CHAPTER XXVII.

ABSOLUTELY BLAMELESS.

Most men who are by nature excitable surprise their friends on occasions by exhibiting great calmness. Shirley Roseleaf, who had often been thrown into the greatest heat by far less important happenings than the one just narrated, seemed a picture of repose as he walked through the wood with his friend in the direction of the horses they had tethered.

"How did you discover they were going to have this meeting?" asked Weil, nervously. "I am all at sea."

"I have been on his track ever since the day I was to have been married," was the reply. "I didn't intend to leave a mystery like that unsolved. I discovered that the Ferns were living here, and that Hannibal originated a few miles further on. I found that Miss Daisy was still a little afraid of him, that he was using an influence over her which was to say the least strange. Before I got at the truth I had some queer misgivings, you may believe."

Mr. Weil stared at his companion.

"But how did you learn all this?" he demanded.

"Oh," said Roseleaf, with a slight laugh, "I've been in this neighborhood for two months. They haven't met once but I heard every word they said. Little by little I gained the truth of the matter. And to-night, as it was perhaps the last time they would be together, I wanted you to understand it perfectly."

Archie frowned at the thoughts that crept in upon his brain.

"Excuse me for saying that you don't appear to mind it much," he muttered. "If you have heard many conversations like the one to which I just listened, and could go away without expressing the thoughts you ought to feel, you are made up differently from me."

"That may be so, too," smiled the other, good-humoredly. "But remember that things are changed. I once was a man in love--now I am simply a writer of romance."

The elder man shivered.

"Could one be actually in love with a girl like that and then recover from it?" he asked, half to himself.

"I don't think I ever was very much in love," was the quick reply. "But never mind that. Let us talk of Hannibal. You spoke of going after him. What would you have done had you carried out that intention?"

Weil had not thought of the matter in this concrete form. He had wanted to punish the negro for his crimes against the woman he so dearly loved, against the old man for whom he had such a warm affection. How he would have accomplished this he had not decided. The first thing was to follow and tax the wretch with his offense. Subsequent events would have depended on the way Hannibal met the accusation. Certainly the temper of the pursuer would have been warm, and his conduct might have been severe.

"I don't know," he said. "I should have told him for one thing that he would have to reckon with something more than a weak girl or a poor old man if he annoyed that family again. In case he had been impertinent I cannot say what I might have been tempted to do."

"All the more reason for congratulating yourself," replied Roseleaf, as they reached the horses, "that you did not follow him. He has promised to keep away from the Ferns, and I think they have seen the last of him. What is done can't be undone, ugly as it is. Now," he continued, vaulting into his saddle, "your course is reasonably plain. You must visit Miss Daisy soon, let her know that the extent of her misfortune is in your possession, and after a reasonable time, ask her to marry you."

Archie Weil, who had also mounted his horse, came near falling from the back of the animal at this very abrupt suggestion.

"That is just what you should do," continued Roseleaf, without allowing him to speak. "You are desperately in love. Daisy likes you very well, and it would take but little effort on your part to induce even a warmer sentiment. Her father thinks you one of the angels that came down to earth and forgot to return to heaven. She ought not to go through life alone. Her only trouble is the suspicion that rests on her name--a suspicion she considers herself bound in honor to do nothing to lift. Show her that you know how innocent she is, and you will bring a new light to her eyes, a new smile to her lips."

"But," asked Archie, catching at the straw, "how can I tell her--how can I explain the source of my information?"

Roseleaf laughed.

"By the novel method of using the truth, or at least a part of it," he said. "Tell her you were out riding and saw Hannibal, and followed him. You needn't count me into it. Why, you've got to let her know, or else I have. It's a thing she would almost give her life to have revealed without her aid. Go like a man and take that heavy weight off her young soul."

Finally Weil consented. He would not discuss the question of whether he would afterwards speak of the hope that lay nearest his heart. But he would go to her, as Roseleaf suggested, and relieve her of the strain that had worn so deeply. He would go the very next day. The sooner it was accomplished the better. The more he thought of it the more delighted he grew that he could carry such

tidings. He could make Daisy happier. That was enough for him--at present. If he could make himself happy at a future date--but there was time enough for that.

He sat upright in his saddle and exulted as his horse bounded nimbly over the ground. Why was it not already day, that he might turn the beast in the opposite direction! The hours would be very long before the sun rose and he could start on his joyful errand. The sombre hue of his countenance disappeared before the contentment that began to fill his breast.

He slept well, notwithstanding the fact that he expected to lie awake all night when he retired. In the morning, on going down to breakfast, he found that Shirley had left still earlier, leaving word that he had started on a quest for game. Weil did not mind. He had enough before him for one day. He was going to see Daisy, and he had that to tell which would lighten the load she had so long felt compelled to carry.

He waited until after nine o'clock, feeling that some regard must be paid to _les convenances_, even on such an important occasion as this. When he was in the saddle he rode as slowly as he could bring himself to do, to make his arrival still later. At last he reached the gate of Oakhurst, and when he had summoned the porter he sent him for Mr. Fern, stating that he had happened to ride in that direction and wanted merely to make a short call.

It was but a few minutes before the servant returned, and the hospitable master of the premises came with him. Mr. Fern upbraided Weil for using so much ceremony, remarking that although he was living in a retired way, there was always one friend he was glad to see. Giving up the horse, Archie accompanied his host to the house, where the latter said he would send at once for Daisy.

"A minute," interpolated Archie. "I want a little talk with you first, alone."

Mr. Fern looked up curiously. He believed he knew what his visitor was about to say. He had long suspected the feelings which Archie entertained for Daisy. He knew also that his daughter would consent to wed no man, no matter who, while there hung over her fair fame the terrible mystery of her wedding night.

"I want to tell you," pursued Archie, before his host could interrupt, "that I have made a great discovery--one of the utmost moment to your family. I know what happened on that day so sad to all of us, and--listen to me, Mr. Fern!--I know that your child is absolutely blameless in the matter."

The listener's face grew very white. He understood imperfectly, but it seemed to him that a tale he could not bear to hear was about to be forced upon him.

"Mr. Weil," he said, earnestly, "I hope you will not continue this subject. I do not know what occurred--I do not wish to know. I have consulted my daughter's sentiments entirely. She prefers to have the veil unlifted, and I respect her wish."

The visitor could hardly contain himself for impatience.

"That has been true hitherto," he replied. "But Miss Daisy herself will be more than delighted when she knows I am aware of the entire facts--which she has been prevented, by a promise extracted from her, from revealing. Call her, let me tell her that I know everything, and how I know it, and you will see the happiest girl in America."

Mr. Fern shook his head doubtfully. He was much afraid of doing something to injure Daisy's feelings. He could not believe she wanted to have the trouble that had crushed her raked up by any one. Archie persisted, however, and his arguments at last won the day.

"You do not think I would come here with any tidings I did not believe agreeable?" he said, interrogatively. "You know I care too much for--for both of you--to do that."

When Miss Daisy was summoned, which she was at last, and Mr. Weil gently let drop a hint of what he had to tell, the girl was hardly less agitated than her father had been. Instead, however, as the visitor expected, of relying on her natural protector during the expected recital, she whispered to Mr. Fern, who obediently rose and let her lead him out of the room. Presently she returned, and took a chair opposite to Mr. Weil. Her face was so pathetic, her attitude so entreating, that he quite forgot what he had come to tell, and leaning toward her, took her hands in his.

"Daisy," he said, "I--I--" and he could go no further.

"Yes, I know," she answered, in a low voice. "But there is a reason why I cannot listen to you. I have told you that before. I ought not even to say as much as this. I should not even remain in the room while you explain the least thing."

He choked down the rising in his throat and hastened, lest she should follow literally the sentiment she had outlined and leave him to himself.

"This has all been true, until now," he said. "You were under a promise, an oath. But--Daisy, last night I heard all that passed between you and your persecutor, and there is no longer any need for mystery between us."

She gasped, as if her breath was going.

"You--you heard!"

"Everything. I was within forty feet of you. Are you sorry that the awful cloud is blown away--that your perfect innocence is proved without a violation of your plighted word?"

For the girl was crying, slowly, without hysteria, crying with both her hands tightly clasped over her eyes.

"_I_ did not need it, not I," continued the man, earnestly. "I knew you had done nothing of your free will that the whole world might not know. But I knew, too, that you would be pleased to have your innocence established. And I was glad for another reason. I love you, Daisy. I have loved you a very long time. Your sister was right in that. Had you not shown such a marked preference for my friend I would have done my best to win you, months and months ago. While you felt that you were an object of suspicion I knew you would not consent to be my wife. Now, that obstacle is gone and--Daisy--I want you."

The hands were withdrawn from the tear-stained face, a handkerchief was hastily passed over it, and Daisy turned half away from the speaker.

"You will not refuse, my love," he murmured, bending again toward her. "You will promise?"

One of her hands strayed toward him, and was clasped joyfully in his own.

"But, in relation to that other matter," said Daisy, some moments later, when the sweet tokens of love had been given and taken, "I must be as silent as before. I have listened to you, but I have not replied. You can understand the reason. Never speak of it to me again, if you do not wish to inflict pain. It is something I cannot discuss."

"I may tell your father, though," he whispered.

"It would be best not. He is content now. No, I beg you, say nothing to any one."

And he promised, like the lover he was, and sealed it with another kiss on her pure mouth.

"I may tell him of--of our love?" he asked.

"Oh, yes; we will tell him of that together."

CHAPTER XXVIII.

TRAPPING A WOLF.

When Shirley Roseleaf left the hotel that morning he carried a fishing rod, a rifle, a gamebag and other acoutrements of the sportsman. In his earlier years, before he ever came to the city, he had been accounted something of an expert with these implements. Since being in this country where there was so much to tempt a Nimrod he had made a number of similar excursions. Although it was some distance to the locality where he intended to go the young man did not take a conveyance of any kind. He walked briskly over the road, breathing the pure air of that early hour, and whistling in a low tone to himself as he went along.

Among the other things he carried was a light lunch, for he did not care to break his fast so early in the day. He had, besides, a contrivance for making coffee and for broiling the fish he expected to catch. Even if his jaunt lasted till night his physical needs were well provided for. One would not have imagined, to see his free and easy swing over the road, that he had anything of greater moment on his mind than to watch for some stray rabbit, or a possible deer track.

Not less than six miles from his starting point, he came to a small lake, to reach which he had followed a narrow path that led through the wood. On the shore was a primitive rowboat, or rather canoe, which he had purchased on another occasion from a native for an insignificant price. Into this boat the novelist stepped, and after safely depositing his traps, took up the paddle and used it skillfully. When he had reached approximately the centre of the lake, he sat down, prepared his fishing tackle and began to angle for the denizens of the water below.

With the patience of a true fisherman Roseleaf sat quietly for two hours, during which time he had drawn out but few specimens. The long walk had, however, given him the appetite he needed, and he now pulled his frail craft toward the shore, with the intention of lighting a fire and preparing a meal. But even when he had nearly reached land he saw splinters flying beneath his feet, and immediately after heard a dull sound which showed what had caused the trouble.

A stray bullet, from some careless hunter, had penetrated his canoe. The hole was large enough to render the boat useless, for the water began to come in rapidly. With two more stout movements of the paddle Roseleaf forced his craft against the shore and sprang upon dry land. Then he quietly picked up the things he had brought with him, and walked a little away from the scene.

"These fellows are getting altogether too careless," he muttered, as he inspected his damp belongings. "A little more and that thing would have been tearing splinters in me."

Scraping some dead wood together, he soon had a fire started, and the cooking of his breakfast was begun. He went about the work methodically, whistling again in that low key he had used when on the way from his hotel, and stopping now and then as the noise of a woodbird or some wild quadruped of the smaller kind came to his ears. He sniffed the coffee that was boiling furiously and the freshly caught fish that sent out an appetizing aroma. No meal served at the Hoffman, the Imperial or the far-famed Delmonico restaurant, could equal this primitive repast, for him.

Finally, all was ready. Helping himself to a large plateful of the delicious food, and pouring out a huge tin cup of the coffee, Roseleaf sat down as if to take his ease while breakfasting. But, instead of touching the viands he had been at such pains to prepare, the next thing he did was to fall prone on the ground. And at the same instant a second bullet whizzed past him and buried itself with a tearing of bark and wood in the tree just behind him.

If Roseleaf had laid down with suddenness he rose with no less speed. As he sprang to his feet he picked up his rifle. He made a dozen steps forward, and then, bringing the weapon to his shoulder, cried to some one in front of him:

"Halt, or I fire!"

A human form that had been creeping away on its hands and knees, now stood upright. It was perhaps thirty yards from the speaker, and when it faced him he saw that the countenance was black.

"Don't come any nearer and don't go any farther off," said the novelist, gravely. "You are at a convenient distance. I can shoot you best where you stand."

The negro looked considerably crestfallen. He seemed doubtful whether to break and run or stay and try to face it out.

"I can't help an accident," he said, at last, when the other remained covering him with the rifle.

"No," was the answer. "An accident is liable to happen to any one, they say. But two accidents, of the same kind, on the same day--accidents that might either of them have been fatal if you were not such an awfully bad marksman--are too many. When _I_ get ready to fire, there will be no accident."

The negro was plainly uneasy. He cast his eyes on the ground and writhed.

"You have dropped your gun," said Roseleaf. "That was right. It would have incommoded your flight, and its only cartridge was used. You would have had no time to reload. I know that gun very well; I have heard it many times in the last six weeks. I knew the sound of it to-day when you fired the first time. A rifle has a voice, like a man; did you know that? I knew it was your gun and that you were at the end of it. With that information in my possession, of course you couldn't catch me napping twice. I pretended to watch my cooking, but in reality I watched nothing but you. There is no need that you should say anything, Hannibal. You could not tell me much, if you tried."

The speaker examined his rifle carefully, still keeping the muzzle turned toward the person he was addressing. The latter did not seem to grow less uneasy.

"I spent some time last evening," continued Roseleaf, presently, "in listening to a little conversation you had with a certain young lady living a mile or so from this spot. That surprises you, does it? I thought it might. I learned how you had ruined her peace of mind, how you had artfully contrived to make her appear the opposite of what she really was. Now, you have tried twice within the last hour to murder me. For this I could have forgiven you. What you did to that young woman is, however, a more serious matter. I don't think anything less than pulling this trigger will expiate that."

He placed the rifle to his shoulder again, as he spoke, and glanced along the sight. The negro half turned, as if of a mind to attempt an escape, and then, realizing the hopelessness of such a move, sank on his knees and raised his hands piteously.

"If you have anything to say, be quick!" said the hard voice of the man who held the rifle.

Then Hannibal blurted out his story. He told how he had been led, step by step, to hope that he might rise above his station, until the wild idea entered his brain that he could even make Daisy Fern love and marry him. He pleaded the disappointments he had suffered, the terrible revulsion of feeling he had undergone, the broken life he had been obliged to take up. He did not want to be killed. If allowed to go he would swear by all that was good never to cross the path of the Ferns, or Roseleaf, or any of their friends again. When his treaties brought no verbal response he grew louder in his tone, feeling that something must be done to move the deaf ears to which he addressed his petition.

"If I allowed you to leave here, you would try to shoot me the next time you had a chance," said the novelist. "I should merely be giving my life in exchange for yours, which I do not consider a good bargain."

"No, I swear it before God!" came the trembling words in reply.

"I cannot trust you."

A slight sound attracted the attention of Roseleaf as he uttered the latter words. It was the sound that oars make when dipped in water. With a quick glance to one side he beheld a rowboat, in which were seated Archie Weil and Daisy Fern, and they were coming directly toward him.

"Here are some of the others you have wronged," he said, pointing. "I will wait to see if their opinions agree with mine."

Daisy saw him first, as Weil was handling the oars, and she called her companion's attention to him. Archie called his name.

"Come here!" was Roseleaf's reply. "I have winged a black duck and I cannot leave."

A few more movements of the oars brought the boat to the shore, and the surprise of its occupants can be imagined when they saw the tableau that awaited them. Hannibal was still groveling on the earth, and the attitude of Roseleaf plainly showed the cause of the negro's terror.

"What has he done?" was the first question, and it was Daisy's voice that asked it.

"Let him tell," replied Roseleaf, nonchalantly. "Tell the lady what you did, Hannibal."

With a courage born of his knowledge of the young lady's kind heart, Hannibal now turned his attention toward her. He begged her to plead with his would-be executioner to give him one more chance for his life, and reiterated his promises to cease meddling with all of their affairs if this was granted. As he spoke Daisy crept nearer to Roseleaf's side, and when he paused for a moment to gain breath, she laid her fair hand on the rifle.

"You would not kill a fellow creature?" she said, gently.

"A fellow creature?" he retorted. "No! But a wolf, a snake, a vulture--yes."

She shook her head slowly, while Mr. Weil looked on, uncertain what to do or say. He wanted more than anything else in his life to lay hands upon the cause of all her woes.

"You have not told me yet what he has done," she said.

"He shall tell you," replied Roseleaf, sharply. "Stand up, Hannibal, and answer truly the questions I am about to propound to you."

The crouching figure tottered to his feet. The negro was weak from fear.

"Did you try twice this morning to murder me?"

"Yes," replied the shaking voice. "But I was insane with my troubles--I did not realize what I was doing--I--"

Daisy's slight hand, still on the barrel of the rifle, was bearing it steadily to the ground.

"Once," she said to Roseleaf, impressively, "you told me you loved me! Have you regard enough left to grant me a favor?"

He shook his head.

"There are favors," he said, "that are crimes. It is one's duty to exterminate vermin, in the interest of the human race."

But, even as he spoke, she was having her way. Her slight strength had taken the weapon from him.

Then, with the face of a forgiving angel she turned toward the negro and uttered very softly one word, "Go!"

Glancing at the others to see if he might safely follow this direction, Hannibal disappeared in the thick woods behind him. He walked with an unsteady step. There was a strange lightness in his brain. Some distance away he found the boat in which he had come, and entered it, staggeringly. Pushing from the shore with a feeble touch on his paddle he set out for his home.

* * * * *

The negroes who found his body, a week later, could not decide whether he had perished by accident or by deliberate intention. The boat was not capsized, but it was partially filled with water, indicating either that he had tried to sink the craft or had leaned too heavily to one side in something like a stupor. When his gun was discovered on the shore, new speculations were set in motion.

Those who knew him recalled that he had been moody for a long time--in fact, ever since he came from the north. They remembered him as a young fellow, four or five years previous, not very different from his mates; and they had stared in wonder when he returned with fine clothes and money in his pocket. The dislike between him and his old acquaintances was mutual. They could not understand him; and what an inferior mind does not comprehend it always views with suspicion.

A grave was made near the border of the lake, and the single word "HANNIBAL" was written on the board that marked the spot. But later some envious hand scrawled beneath it:

"HE WANTED TO BE A GENTLEMAN!"

CHAPTER XXIX.

"THE GREATEST NOVEL."

Archie Weil and Daisy Fern were married in June. There was no need of waiting longer. It was a case of true love sanctified by suffering and devotion. The bright eyes and ruddy cheeks of the bride testified to her renewed health and spirits. The news of Hannibal's death--albeit it brought a tear to her eyes, had removed the only shadow that stretched across her pathway.

Shirley Roseleaf did not come to the wedding, to which he was the only invited guest. He wrote that an important mission from his magazine made it impossible to accept the invitation, but he sent a handsome present and a letter to Archie, congratulating him in the warmest manner.

For some time Lawrence Gouger had been urging the novelist to hasten the wonderful story that was to make his fortune and give a new impetus to the house of Cutt & Slashem. They had consulted together a hundred times, and the thirty chapters already finished seemed to leave but a few weeks' steady work to be accomplished. Shortly after the wedding Gouger went to Roseleaf's rooms, one evening, and begged him to lose no further time.

"What is there to wait for now?" he asked. "All the dramatic incidents have occurred. You only need to wind up with a glory of fireworks, showing virtue triumphant and vice buried under a North Carolina sycamore. Come, my dear boy, when may I expect to see the work completed?"

Roseleaf did not answer for some seconds.

"There is a part of this story that you do not comprehend," he said, finally. "A chapter is yet to be written at which you have not guessed."

"Indeed!" exclaimed the listener.

"Yes," nodded the other. "So far the character that is supposed to represent myself appears that of a heartless, cold, unfeeling wretch. Do you think I shall be satisfied to leave it that way?"

The critic stared at the speaker in astonishment.

"I--I do not understand," he replied.

"I thought not," said Roseleaf, soberly. "Well, this story, to be truthful, must do justice to the one who is supposed to personate its author. And, in the first place, to avoid all circumlocution, let me tell you there has never been a moment since I first loved Daisy Fern that she has not been the dearest thing on this earth to me!"

Mr. Gouger could not reconcile this statement with the events that had taken place, and his puzzled countenance said as much.

"I acted like a villain, did I not," continued Roseleaf, after a slight pause, "when the news was brought that she had disappeared? I seemed to have no faith in her, no confidence in Archie, no trust in that poor old man, her father. Why? I was so madly, insanely in love that every possible phantasy got possession of my excited brain. To lose her was to deprive me of all hope, all ambition, all care for life. So far, I acted my real self. If what I supposed true had been proven I think there would have been a murder. Not of Daisy; ah, no! but of the man who had robbed me of my treasure. Then I went to Midlands with Archie and I saw her. I heard her speak, and like a lightning flash it came to me. He was as honorable as a man could be and she cared more for him than for my unworthy self. She had contrasted us and discovered how much he was my superior. And I said to myself at that moment, 'I will give her up! If it costs me my happiness as long as I live I will give her up! No matter what happens, I will unite these people, who have been so faithful to me and toward whom I have acted the part of a cur and a coward!'"

The young man was speaking with perfect composure, but with intense earnestness.

"The first thing to be done," he continued, "was to take myself out of their way. The next was to unravel the mystery that had made the trouble. I knew, when my mind had resumed its natural state, that, whatever had occurred, Daisy was blameless. I knew that something far out of the common line had caused her to commit the act which had cast a blight over her reputation. For weeks I could find no clue. Then, one day, in the street, I saw Hannibal, the negro for whom she had borrowed my money and who I supposed was still in France. I cannot help the quick temper I have inherited, and I confess that the sight of that fellow aroused my suspicions against this girl, only they took a new and more horrible form.

"I remembered distinctly what a strong hold Hannibal had on the Fern family. I recalled, with frightful distinctness, the manner in which he attended Daisy at table, his interest in her health, the $1,000 she had given him, her quick movement to prevent my striking him when his answers insulted us both. Perhaps--but I will not dilate on the things that came to my distorted imagination. It was enough for me to put a detective on his track. I engaged Hazen, and in three days he came to tell me that a white woman had passed the night with Hannibal at a house on Seventh Avenue, the date corresponding with the one on which I was to have been married!"

Gouger listened spellbound. It seemed to him that the most exciting chapter of this weird tale was yet to be written.

"If I had lost control of my senses before," pursued Roseleaf, "what do you suppose happened when this information was brought to me? But then I found an excuse for my beloved one. I considered her the victim of one of those forms of hypnotism of which there can no longer be any doubt. She could not have gone there without the demoniac influence of a stronger personality. He had charmed her from her home by the exercise of diabolic arts. My fury was entirely for him. I sought him at once, only to learn that he had left the city a few days before, leaving absolutely no trace. I could not give over the hunt, however. If he was on the earth I must find him and be avenged for the wrong he had done. It occurred to me that an influence so strong as he had exerted would not be given up. Wherever the Ferns had gone, he would probably be found. I discovered the whereabouts of the family, after a great deal of effort, and went to North Carolina. With the patience of a dog and the cunning of a fox I laid in wait for weeks, and one night I saw and heard Daisy Fern and Hannibal in conversation!"

There was no movement on the part of the critic. He sat as still as a block of stone.

"When they began to speak I could have sworn that my recent guesses were correct ones. It was at about the hour of midnight, and she had crept quietly and alone out of her house to meet this African. But the first dozen sentences that were uttered gave me a new version of the affair. It was by no mesmeric power, but by a threat of injury to her father that this fellow held her under bond. I learned that Mr. Fern had done something--I could not then tell what--which rendered him liable to imprisonment. I learned, also, beyond question--for they spoke without restraint, supposing themselves alone--that, whatever the purpose of Hannibal when Daisy came to his rooms on the day she was to have been married, it had not been accomplished. She was afraid of him, but only for her father's sake. And I discovered beside, though not with perfect clearness, that a promise of secrecy accounted for her refusal to explain the cause of that absence which had altered the whole course of our lives.

"I have said I had watched with patience. I determined to continue my watch till I understood the entire situation. About once a week they met in the way I have described, and as the next date was always arranged in my hearing there was no difficulty in my keeping the appointment. In the meantime I learned that Hannibal was born in the vicinity, that he was living a hermit life, and that nobody knew of the surreptitious visits he was paying to Oakhurst. Then one day I heard that Archie was at the hotel, and thinking it time that I let him into the secret I went there, pretending I had just arrived from the north, when in reality I had been boarding for months five miles away. The rest you know. I was enabled to prove to him as well as to myself what had actually happened. Since then justice has been done to us all."

Mr. Gouger had to speak at last.

"To _you_?" he asked. "Do you admit that all this is just to you?"

"Without doubt," said Roseleaf. "I forfeited every right to the woman I had insulted by my suspicions. There are certain metals that can only be tried by fire. I was placed in the crucible, and found wanting."

The critic shook his head sagely.

"You are a regular Roman father to your own delinquencies," he answered. "But tell me another thing. Would you have shot Hannibal if Mr. Weil and Miss Fern had not made their appearance?"

"I have not the least doubt of it. He was in my eyes at that moment a crawling adder, whose fangs were liable to penetrate the flesh of some one if he was not put out of the way. But I am more than glad I was spared the infliction of his punishment."

Gouger wore a strange look.

"And yet he had one most human quality," said he.

"Yes, I admit that now," was the reply. "In his passionate, barbaric way, he certainly loved. When I revise my novel I shall try to deal fairly with him."

"And you will finish it very soon now?"

"As soon as possible."

A month later Lawrence Gouger received at his office a package marked on the outside, "From Shirley Roseleaf." He could hardly control his excitement until he had untied the strings, taken off the wrappings and disclosed the tin box inside. It was a square box, just the right size for manuscript paper such as he had seen Roseleaf use, and the heart of the enthusiast beat high as he took it in his hands. A jewel case filled with the costliest stones would not have seemed to him more precious. The fame of a new author would soon resound through the world! Cutt & Slashem would have the greatest work of fiction of recent years in their next catalogue! And he, Lawrence Gouger, would be given the credit of discovering--one might almost say of inventing--this wonder!

Opening the box, the critic looked at its contents and then dropped it with an exclamation. It contained nothing but a small sealed envelope and _a heap of ashes_!

Ashes! Ashes made from recently burned paper!

When he recovered enough to open the envelope, this note was found within:

"TO LAWRENCE GOUGER, ESQ:--DEAR SIR: Enclosed herewith you will find the novel for which you have waited so long. I hope it will please you in all respects, as I certainly have taken the greatest pains with it.

"On reading it over I thought it best to more thoroughly disguise the personality of the characters, lest any of them might be injured by its publication. There was the happiness of a newly-made bride to be considered; her husband's ease of mind; her father's serene old age; her sister's feelings. There was even a black man who had perhaps suffered enough, and a critic employed by a large publishing firm who would not like his true character made manifest in type. In order to protect these people I have applied a match to the pages. You can best tell whether I have performed the work too well.

"If this novel does not bring me the fame you anticipate I shall not much care; I have lost some of my ambitions. If it fails to add to my fortune, never mind; a single man has no great need of wealth.

"I go to-night on board a steamer which sails for Europe at daybreak. When you read this I shall be on the sea. I have secured a position as resident correspondent abroad for one of the great newspapers. Perhaps I never shall return. Truly your friend, S. R."

"_The idiot!_" cried the reader, as he finished perusing this letter. "_The imbecile!_ Was there ever such a fool born on this earth!"

Then he apostrophised the heap of ashes that lay in the box before him.

"There never was and never will be so great a work of fiction as you were yesterday! And yet a little touch of flame, and all was extinguished! How like you were to man! Let him have the brain of a Shakespeare, and a pound weight falling on his skull ends everything.

"There was a flood in Hungary last week, in which a thousand people were drowned. There was an earthquake in Peru where five hundred perished. A vessel went down off the Caroline Islands. Taken all together, they did not equal to this world your loss.

"The poet knew what he was saying: 'Great wits are sure to madness near allied.' Oh, to think that a mind that could execute your thrilling pages knew no more than to destroy them!

"I will not cast you, sublime ashes, to the winds of heaven! I will keep you reverently, as one preserves the cloak of a great man, or the bones of a mastodon. Behold, I close you again in your covers, where the eye of no mortal shall henceforth behold you."

With the words the disappointed critic performed the action. And to this day visitors to his room read with wonder the inscription he has placed on the box:

"_The greatest novel that ever was written._"

THE END.

Of The Logic Of Practice, Or Art; Including Morality And Policy. Footnotes

PREFACE TO THE FIRST EDITION.

This book makes no pretense of giving to the world a new theory of the intellectual operations. Its claim to attention, if it possess any, is grounded on the fact that it is an attempt, not to supersede, but to embody and systematize, the best ideas which have been either promulgated on its subject by speculative writers, or conformed to by accurate thinkers in their scientific inquiries.

To cement together the detached fragments of a subject, never yet treated as a whole; to harmonize the true portions of discordant theories, by supplying the links of thought necessary to connect them, and by disentangling them from the errors with which they are always more or less interwoven, must necessarily require a considerable amount of original speculation. To other originality than this, the present work lays no claim. In the existing state of the cultivation of the sciences, there would be a very strong presumption against any one who should imagine that he had effected a revolution in the theory of the investigation of truth, or added any fundamentally new process to the practice of it. The improvement which remains to be effected in the methods of philosophizing (and the author believes that they have much need of improvement) can only consist in performing more systematically and accurately operations with which, at least in their elementary form, the human intellect, in some one or other of its employments, is already familiar.

In the portion of the work which treats of Ratiocination, the author has not deemed it necessary to enter into technical details which may be obtained in so perfect a shape from the existing treatises on what is termed the Logic of the Schools. In the contempt entertained by many modern philosophers for the syllogistic art, it will be seen that he by no means participates; though the scientific theory on which its defense is usually rested appears to him erroneous: and the view which he has suggested of the nature and functions of the Syllogism may, perhaps, afford the means of conciliating the principles of the art with as much as is well grounded in the doctrines and objections of its assailants.

The same abstinence from details could not be observed in the First Book, on Names and Propositions; because many useful principles and distinctions which were contained in the old Logic have been gradually omitted from the writings of its later teachers; and it appeared desirable both to revive these, and to reform and rationalize the philosophical foundation on which they stood. The earlier chapters of this preliminary Book will consequently appear, to some readers, needlessly elementary and scholastic. But those who know in what darkness the nature of our knowledge, and of the processes by which it is obtained, is often involved by a confused apprehension of the import of the different classes of Words and Assertions, will not regard these discussions as either frivolous, or irrelevant to the topics considered in the later Books.

On the subject of Induction, the task to be performed was that of generalizing the modes of investigating truth and estimating evidence, by which so many important and recondite laws of nature have, in the various sciences, been aggregated to the stock of human knowledge. That this is not a task free from difficulty may be presumed from the fact that even at a very recent period, eminent writers (among whom it is sufficient to name Archbishop Whately, and the author of a celebrated article on Bacon in the _Edinburgh Review_) have not scrupled to pronounce it impossible.(1) The author has endeavored to combat their theory in the manner in which Diogenes confuted the skeptical reasonings against the possibility of motion; remembering that Diogenes's argument would have been equally conclusive, though his individual perambulations might not have extended beyond the circuit of his own tub.

Whatever may be the value of what the author has succeeded in effecting on this branch of his subject, it is a duty to acknowledge that for much of it he has been indebted to several important treatises, partly historical and partly philosophical, on the generalities and processes of physical science, which have been published within the last few years. To these treatises, and to their authors, he has endeavored to do justice in the body of the work. But as with one of these writers, Dr. Whewell, he has occasion frequently to express differences of opinion, it is more particularly incumbent on him in this place to declare, that without the aid derived from the

facts and ideas contained in that gentleman's "History of the Inductive Sciences," the corresponding portion of this work would probably not have been written.

The concluding Book is an attempt to contribute toward the solution of a question which the decay of old opinions, and the agitation that disturbs European society to its inmost depths, render as important in the present day to the practical interests of human life, as it must at all times be to the completeness of our speculative knowledge—viz.: Whether moral and social phenomena are really exceptions to the general certainty and uniformity of the course of nature; and how far the methods by which so many of the laws of the physical world have been numbered among truths irrevocably acquired and universally assented to, can be made instrumental to the formation of a similar body of received doctrine in moral and political science.

PREFACE TO THE THIRD AND FOURTH EDITIONS.

Several criticisms, of a more or less controversial character, on this work, have appeared since the publication of the second edition; and Dr. Whewell has lately published a reply to those parts of it in which some of his opinions were controverted.(2)

I have carefully reconsidered all the points on which my conclusions have been assailed. But I have not to announce a change of opinion on any matter of importance. Such minor oversights as have been detected, either by myself or by my critics, I have, in general silently, corrected: but it is not to be inferred that I agree with the objections which have been made to a passage, in every instance in which I have altered or canceled it. I have often done so, merely that it might not remain a stumbling-block, when the amount of discussion necessary to place the matter in its true light would have exceeded what was suitable to the occasion.

To several of the arguments which have been urged against me, I have thought it useful to reply with some degree of minuteness; not from any taste for controversy, but because the opportunity was favorable for placing my own conclusions, and the grounds of them, more clearly and completely before the reader. Truth on these subjects is militant, and can only establish itself by means of conflict. The most opposite opinions can make a plausible show of evidence while each has the statement of its own case; and it is only possible to ascertain which of them is in the right, after hearing and comparing what each can say against the other, and what the other can urge in its defense.

Even the criticisms from which I most dissent have been of great service to me, by showing in what places the exposition most needed to be improved, or the argument strengthened. And I should have been well pleased if the book had undergone a much greater amount of attack; as in that case I should probably have been enabled to improve it still more than I believe I have now done.

In the subsequent editions, the attempt to improve the work by additions and corrections, suggested by criticism or by thought, has been continued. The additions and corrections in the present (eighth) edition, which are not very considerable, are chiefly such as have been suggested by Professor Bain's "Logic," a book of great merit and value. Mr. Bain's view of the science is essentially the same with that taken in the present treatise, the differences of opinion being few and unimportant compared with the agreements; and he has not only enriched the exposition by many applications and illustrative details, but has appended to it a minute and very valuable discussion of the logical principles specially applicable to each of the sciences—a task for which the encyclopedical character of his knowledge peculiarly qualified him. I have in several instances made use of his exposition to improve my own, by adopting, and occasionally by controverting, matter contained in his treatise.

The longest of the additions belongs to the chapter on Causation, and is a discussion of the question how far, if at all, the ordinary mode of stating the law of Cause and Effect requires modification to adapt it to the new doctrine of the Conservation of Force—a point still more fully and elaborately treated in Mr. Bain's work.

INTRODUCTION.

§ 1. There is as great diversity among authors in the modes which they have adopted of defining logic, as in their treatment of the details of it. This is what might naturally be expected on any subject on which writers have availed themselves of the same language as a means of delivering different ideas. Ethics and jurisprudence are liable to the remark in common with logic. Almost every writer having taken a different view of some of the particulars which these branches of knowledge are usually understood to include; each has so framed his definition as to indicate beforehand his own peculiar tenets, and sometimes to beg the question in

their favor.

This diversity is not so much an evil to be complained of, as an inevitable and in some degree a proper result of the imperfect state of those sciences. It is not to be expected that there should be agreement about the definition of any thing, until there is agreement about the thing itself. To define, is to select from among all the properties of a thing, those which shall be understood to be designated and declared by its name; and the properties must be well known to us before we can be competent to determine which of them are fittest to be chosen for this purpose. Accordingly, in the case of so complex an aggregation of particulars as are comprehended in any thing which can be called a science, the definition we set out with is seldom that which a more extensive knowledge of the subject shows to be the most appropriate. Until we know the particulars themselves, we can not fix upon the most correct and compact mode of circumscribing them by a general description. It was not until after an extensive and accurate acquaintance with the details of chemical phenomena, that it was found possible to frame a rational definition of chemistry; and the definition of the science of life and organization is still a matter of dispute. So long as the sciences are imperfect, the definitions must partake of their imperfection; and if the former are progressive, the latter ought to be so too. As much, therefore, as is to be expected from a definition placed at the commencement of a subject, is that it should define the scope of our inquiries: and the definition which I am about to offer of the science of logic, pretends to nothing more than to be a statement of the question which I have put to myself, and which this book is an attempt to resolve. The reader is at liberty to object to it as a definition of logic; but it is at all events a correct definition of the subject of this volume.

§ 2. Logic has often been called the Art of Reasoning. A writer(3) who has done more than any other person to restore this study to the rank from which it had fallen in the estimation of the cultivated class in our own country, has adopted the above definition with an amendment; he has defined Logic to be the Science, as well as the Art, of reasoning; meaning by the former term, the analysis of the mental process which takes place whenever we reason, and by the latter, the rules, grounded on that analysis, for conducting the process correctly. There can be no doubt as to the propriety of the emendation. A right understanding of the mental process itself, of the conditions it depends on, and the steps of which it consists, is the only basis on which a system of rules, fitted for the direction of the process, can possibly be founded. Art necessarily presupposes knowledge; art, in any but its infant state, presupposes scientific knowledge: and if every art does not bear the name of a science, it is only because several sciences are often necessary to form the groundwork of a single art. So complicated are the conditions which govern our practical agency, that to enable one thing to be _done_, it is often requisite to _know_ the nature and properties of many things.

Logic, then, comprises the science of reasoning, as well as an art, founded on that science. But the word Reasoning, again, like most other scientific terms in popular use, abounds in ambiguities. In one of its acceptations, it means syllogizing; or the mode of inference which may be called (with sufficient accuracy for the present purpose) concluding from generals to particulars. In another of its senses, to reason is simply to infer any assertion, from assertions already admitted: and in this sense induction is as much entitled to be called reasoning as the demonstrations of geometry.

Writers on logic have generally preferred the former acceptation of the term: the latter, and more extensive signification is that in which I mean to use it. I do this by virtue of the right I claim for every author, to give whatever provisional definition he pleases of his own subject. But sufficient reasons will, I believe, unfold themselves as we advance, why this should be not only the provisional but the final definition. It involves, at all events, no arbitrary change in the meaning of the word; for, with the general usage of the English language, the wider signification, I believe, accords better than the more restricted one.

§ 3. But reasoning, even in the widest sense of which the word is susceptible, does not seem to comprehend all that is included, either in the best, or even in the most current, conception of the scope and province of our science. The employment of the word Logic to denote the theory of Argumentation, is derived from the Aristotelian, or, as they are commonly termed, the scholastic, logicians. Yet even with them, in their systematic treatises, Argumentation was the subject only of the third part: the two former treated of Terms, and of Propositions; under one or other of which heads were also included Definition and Division. By some, indeed, these previous topics were professedly introduced only on account of their connection with reasoning, and as a preparation for the doctrine and rules of the syllogism. Yet they were treated with greater minuteness, and dwelt on at greater length, than was required for that purpose alone. More recent writers on logic have generally understood the term as it was employed by the able author of the Port Royal Logic; viz., as equivalent to the Art of Thinking. Nor is this acceptation confined to books, and scientific inquiries. Even in ordinary conversation, the ideas connected with the word Logic include at least precision of language, and accuracy of classification: and we perhaps oftener hear persons speak of a logical arrangement, or of expressions logically defined, than of conclusions logically deduced from premises. Again, a man is often called a great logician, or a man of powerful logic, not for the accuracy of his deductions, but for the extent of his command over premises; because the general propositions required for

explaining a difficulty or refuting a sophism, copiously and promptly occur to him: because, in short, his knowledge, besides being ample, is well under his command for argumentative use. Whether, therefore, we conform to the practice of those who have made the subject their particular study, or to that of popular writers and common discourse, the province of logic will include several operations of the intellect not usually considered to fall within the meaning of the terms Reasoning and Argumentation.

These various operations might be brought within the compass of the science, and the additional advantage be obtained of a very simple definition, if, by an extension of the term, sanctioned by high authorities, we were to define logic as the science which treats of the operations of the human understanding in the pursuit of truth. For to this ultimate end, naming, classification, definition, and all other operations over which logic has ever claimed jurisdiction, are essentially subsidiary. They may all be regarded as contrivances for enabling a person to know the truths which are needful to him, and to know them at the precise moment at which they are needful. Other purposes, indeed, are also served by these operations; for instance, that of imparting our knowledge to others. But, viewed with regard to this purpose, they have never been considered as within the province of the logician. The sole object of Logic is the guidance of one's own thoughts: the communication of those thoughts to others falls under the consideration of Rhetoric, in the large sense in which that art was conceived by the ancients; or of the still more extensive art of Education. Logic takes cognizance of our intellectual operations only as they conduce to our own knowledge, and to our command over that knowledge for our own uses. If there were but one rational being in the universe, that being might be a perfect logician; and the science and art of logic would be the same for that one person as for the whole human race.

§ 4. But, if the definition which we formerly examined included too little, that which is now suggested has the opposite fault of including too much.

Truths are known to us in two ways: some are known directly, and of themselves; some through the medium of other truths. The former are the subject of Intuition, or Consciousness;(4) the latter, of Inference. The truths known by intuition are the original premises from which all others are inferred. Our assent to the conclusion being grounded on the truth of the premises, we never could arrive at any knowledge by reasoning, unless something could be known antecedently to all reasoning.

Examples of truths known to us by immediate consciousness, are our own bodily sensations and mental feelings. I know directly, and of my own knowledge, that I was vexed yesterday, or that I am hungry to-day. Examples of truths which we know only by way of inference, are occurrences which took place while we were absent, the events recorded in history, or the theorems of mathematics. The two former we infer from the testimony adduced, or from the traces of those past occurrences which still exist; the latter, from the premises laid down in books of geometry, under the title of definitions and axioms. Whatever we are capable of knowing must belong to the one class or to the other; must be in the number of the primitive data, or of the conclusions which can be drawn from these.

With the original data, or ultimate premises of our knowledge; with their number or nature, the mode in which they are obtained, or the tests by which they may be distinguished; logic, in a direct way at least, has, in the sense in which I conceive the science, nothing to do. These questions are partly not a subject of science at all, partly that of a very different science.

Whatever is known to us by consciousness is known beyond possibility of question. What one sees or feels, whether bodily or mentally, one can not but be sure that one sees or feels. No science is required for the purpose of establishing such truths; no rules of art can render our knowledge of them more certain than it is in itself. There is no logic for this portion of our knowledge.

But we may fancy that we see or feel what we in reality infer. A truth, or supposed truth, which is really the result of a very rapid inference, may seem to be apprehended intuitively. It has long been agreed by thinkers of the most opposite schools, that this mistake is actually made in so familiar an instance as that of the eyesight. There is nothing of which we appear to ourselves to be more directly conscious than the distance of an object from us. Yet it has long been ascertained, that what is perceived by the eye, is at most nothing more than a variously colored surface; that when we fancy we see distance, all we really see is certain variations of apparent size, and degrees of faintness of color; that our estimate of the object's distance from us is the result partly of a rapid inference from the muscular sensations accompanying the adjustment of the focal distance of the eye to objects unequally remote from us, and partly of a comparison (made with so much rapidity that we are unconscious of making it) between the size and color of the object as they appear at the time, and the size and color of the same or of similar objects as they appeared when close at hand, or when their degree of remoteness was known by other evidence. The perception of distance by the eye, which seems so like intuition, is thus, in reality, an inference grounded on experience; an inference, too, which we learn to make; and which we make with more and more correctness as our experience increases; though in familiar cases it takes place so rapidly as to appear

exactly on a par with those perceptions of sight which are really intuitive, our perceptions of color.(5)

Of the science, therefore, which expounds the operations of the human understanding in the pursuit of truth, one essential part is the inquiry: What are the facts which are the objects of intuition or consciousness, and what are those which we merely infer? But this inquiry has never been considered a portion of logic. Its place is in another and a perfectly distinct department of science, to which the name metaphysics more particularly belongs: that portion of mental philosophy which attempts to determine what part of the furniture of the mind belongs to it originally, and what part is constructed out of materials furnished to it from without. To this science appertain the great and much debated questions of the existence of matter; the existence of spirit, and of a distinction between it and matter; the reality of time and space, as things without the mind, and distinguishable from the objects which are said to exist in them. For in the present state of the discussion on these topics, it is almost universally allowed that the existence of matter or of spirit, of space or of time, is in its nature unsusceptible of being proved; and that if any thing is known of them, it must be by immediate intuition. To the same science belong the inquiries into the nature of Conception, Perception, Memory, and Belief; all of which are operations of the understanding in the pursuit of truth; but with which, as phenomena of the mind, or with the possibility which may or may not exist of analyzing any of them into simpler phenomena, the logician as such has no concern. To this science must also be referred the following, and all analogous questions: To what extent our intellectual faculties and our emotions are innate—to what extent the result of association: Whether God and duty are realities, the existence of which is manifest to us _a priori_ by the constitution of our rational faculty; or whether our ideas of them are acquired notions, the origin of which we are able to trace and explain; and the reality of the objects themselves a question not of consciousness or intuition, but of evidence and reasoning.

The province of logic must be restricted to that portion of our knowledge which consists of inferences from truths previously known; whether those antecedent data be general propositions, or particular observations and perceptions. Logic is not the science of Belief, but the science of Proof, or Evidence. In so far as belief professes to be founded on proof, the office of logic is to supply a test for ascertaining whether or not the belief is well grounded. With the claims which any proposition has to belief on the evidence of consciousness—that is, without evidence in the proper sense of the word—logic has nothing to do.

§ 5. By far the greatest portion of our knowledge, whether of general truths or of particular facts, being avowedly matter of inference, nearly the whole, not only of science, but of human conduct, is amenable to the authority of logic. To draw inferences has been said to be the great business of life. Every one has daily, hourly, and momentary need of ascertaining facts which he has not directly observed; not from any general purpose of adding to his stock of knowledge, but because the facts themselves are of importance to his interests or to his occupations. The business of the magistrate, of the military commander, of the navigator, of the physician, of the agriculturist, is merely to judge of evidence, and to act accordingly. They all have to ascertain certain facts, in order that they may afterward apply certain rules, either devised by themselves or prescribed for their guidance by others; and as they do this well or ill, so they discharge well or ill the duties of their several callings. It is the only occupation in which the mind never ceases to be engaged; and is the subject, not of logic, but of knowledge in general.

Logic, however, is not the same thing with knowledge, though the field of logic is co-extensive with the field of knowledge. Logic is the common judge and arbiter of all particular investigations. It does not undertake to find evidence, but to determine whether it has been found. Logic neither observes, nor invents, nor discovers; but judges. It is no part of the business of logic to inform the surgeon what appearances are found to accompany a violent death. This he must learn from his own experience and observation, or from that of others, his predecessors in his peculiar pursuit. But logic sits in judgment on the sufficiency of that observation and experience to justify his rules, and on the sufficiency of his rules to justify his conduct. It does not give him proofs, but teaches him what makes them proofs, and how he is to judge of them. It does not teach that any particular fact proves any other, but points out to what conditions all facts must conform, in order that they may prove other facts. To decide whether any given fact fulfills these conditions, or whether facts can be found which fulfill them in a given case, belongs exclusively to the particular art or science, or to our knowledge of the particular subject.

It is in this sense that logic is, what it was so expressively called by the schoolmen and by Bacon, _ars artium_; the science of science itself. All science consists of data and conclusions from those data, of proofs and what they prove: now logic points out what relations must subsist between data and whatever can be concluded from them, between proof and every thing which it can prove. If there be any such indispensable relations, and if these can be precisely determined, every particular branch of science, as well as every individual in the guidance of his conduct, is bound to conform to those relations, under the penalty of making false inferences—of drawing conclusions which are not grounded in the realities of things. Whatever has at any time been concluded justly, whatever knowledge has been acquired otherwise than by immediate intuition, depended on the observance of the laws

which it is the province of logic to investigate. If the conclusions are just, and the knowledge real, those laws, whether known or not, have been observed.

§ 6. We need not, therefore, seek any further for a solution of the question, so often agitated, respecting the utility of logic. If a science of logic exists, or is capable of existing, it must be useful. If there be rules to which every mind consciously or unconsciously conforms in every instance in which it infers rightly, there seems little necessity for discussing whether a person is more likely to observe those rules, when he knows the rules, than when he is unacquainted with them.

A science may undoubtedly be brought to a certain, not inconsiderable, stage of advancement, without the application of any other logic to it than what all persons, who are said to have a sound understanding, acquire empirically in the course of their studies. Mankind judged of evidence, and often correctly, before logic was a science, or they never could have made it one. And they executed great mechanical works before they understood the laws of mechanics. But there are limits both to what mechanicians can do without principles of mechanics, and to what thinkers can do without principles of logic. A few individuals, by extraordinary genius, or by the accidental acquisition of a good set of intellectual habits, may work without principles in the same way, or nearly the same way, in which they would have worked if they had been in possession of principles. But the bulk of mankind require either to understand the theory of what they are doing, or to have rules laid down for them by those who have understood the theory. In the progress of science from its easiest to its more difficult problems, each great step in advance has usually had either as its precursor, or as its accompaniment and necessary condition, a corresponding improvement in the notions and principles of logic received among the most advanced thinkers. And if several of the more difficult sciences are still in so defective a state; if not only so little is proved, but disputation has not terminated even about the little which seemed to be so; the reason perhaps is, that men's logical notions have not yet acquired the degree of extension, or of accuracy, requisite for the estimation of the evidence proper to those particular departments of knowledge.

§ 7. Logic, then, is the science of the operations of the understanding which are subservient to the estimation of evidence: both the process itself of advancing from known truths to unknown, and all other intellectual operations in so far as auxiliary to this. It includes, therefore, the operation of Naming; for language is an instrument of thought, as well as a means of communicating our thoughts. It includes, also, Definition, and Classification. For, the use of these operations (putting all other minds than one's own out of consideration) is to serve not only for keeping our evidences and the conclusions from them permanent and readily accessible in the memory, but for so marshaling the facts which we may at any time be engaged in investigating, as to enable us to perceive more clearly what evidence there is, and to judge with fewer chances of error whether it be sufficient. These, therefore, are operations specially instrumental to the estimation of evidence, and, as such, are within the province of Logic. There are other more elementary processes, concerned in all thinking, such as Conception, Memory, and the like; but of these it is not necessary that Logic should take any peculiar cognizance, since they have no special connection with the problem of Evidence, further than that, like all other problems addressed to the understanding, it presupposes them.

Our object, then, will be, to attempt a correct analysis of the intellectual process called Reasoning or Inference, and of such other mental operations as are intended to facilitate this: as well as, on the foundation of this analysis, and _pari passu_ with it, to bring together or frame a set of rules or canons for testing the sufficiency of any given evidence to prove any given proposition.

With respect to the first part of this undertaking, I do not attempt to decompose the mental operations in question into their ultimate elements. It is enough if the analysis as far as it goes is correct, and if it goes far enough for the practical purposes of logic considered as an art. The separation of a complicated phenomenon into its component parts is not like a connected and interdependent chain of proof. If one link of an argument breaks, the whole drops to the ground; but one step toward an analysis holds good and has an independent value, though we should never be able to make a second. The results which have been obtained by analytical chemistry are not the less valuable, though it should be discovered that all which we now call simple substances are really compounds. All other things are at any rate compounded of those elements: whether the elements themselves admit of decomposition, is an important inquiry, but does not affect the certainty of the science up to that point.

I shall, accordingly, attempt to analyze the process of inference, and the processes subordinate to inference, so far only as may be requisite for ascertaining the difference between a correct and an incorrect performance of those processes. The reason for thus limiting our design, is evident. It has been said by objectors to logic, that we do not learn to use our muscles by studying their anatomy. The fact is not quite fairly stated; for if the action of any of our muscles were vitiated by local weakness, or other physical defect, a knowledge of their anatomy might be very necessary for effecting a cure. But we should be justly liable to the criticism involved in this objection, were we, in a treatise on logic, to carry the analysis of the reasoning process beyond the point at which

any inaccuracy which may have crept into it must become visible. In learning bodily exercises (to carry on the same illustration) we do, and must, analyze the bodily motions so far as is necessary for distinguishing those which ought to be performed from those which ought not. To a similar extent, and no further, it is necessary that the logician should analyze the mental processes with which Logic is concerned. Logic has no interest in carrying the analysis beyond the point at which it becomes apparent whether the operations have in any individual case been rightly or wrongly performed: in the same manner as the science of music teaches us to discriminate between musical notes, and to know the combinations of which they are susceptible, but not what number of vibrations in a second correspond to each; which, though useful to be known, is useful for totally different purposes. The extension of Logic as a Science is determined by its necessities as an Art: whatever it does not need for its practical ends, it leaves to the larger science which may be said to correspond, not to any particular art, but to art in general; the science which deals with the constitution of the human faculties; and to which, in the part of our mental nature which concerns Logic, as well as in all other parts, it belongs to decide what are ultimate facts, and what are resolvable into other facts. And I believe it will be found that most of the conclusions arrived at in this work have no necessary connection with any particular views respecting the ulterior analysis. Logic is common ground on which the partisans of Hartley and of Reid, of Locke and of Kant, may meet and join hands. Particular and detached opinions of all these thinkers will no doubt occasionally be controverted, since all of them were logicians as well as metaphysicians; but the field on which their principal battles have been fought, lies beyond the boundaries of our science.

It can not, indeed, be pretended that logical principles can be altogether irrelevant to those more abstruse discussions; nor is it possible but that the view we are led to take of the problem which logic proposes, must have a tendency favorable to the adoption of some one opinion, on these controverted subjects, rather than another. For metaphysics, in endeavoring to solve its own peculiar problem, must employ means, the validity of which falls under the cognizance of logic. It proceeds, no doubt, as far as possible, merely by a closer and more attentive interrogation of our consciousness, or more properly speaking, of our memory; and so far is not amenable to logic. But wherever this method is insufficient to attain the end of its inquiries, it must proceed, like other sciences, by means of evidence. Now, the moment this science begins to draw inferences from evidence, logic becomes the sovereign judge whether its inferences are well grounded, or what other inferences would be so.

This, however, constitutes no nearer or other relation between logic and metaphysics, than that which exists between logic and every other science. And I can conscientiously affirm that no one proposition laid down in this work has been adopted for the sake of establishing, or with any reference to its fitness for being employed in establishing, preconceived opinions in any department of knowledge or of inquiry on which the speculative world is still undecided.(6)

Book I.

OF NAMES AND PROPOSITIONS.

“La scolastique, qui produisit dans la logique, comme dans la morale, et dans une partie de la métaphysique, une subtilité, une précision d’idées, dont l’habitude inconnue aux anciens, a contribué plus qu’on ne croit au progrès de la bonne philosophie.”—CONDORCET, _Vie de Turgot_.

“To the schoolmen the vulgar languages are principally indebted for what precision and analytic subtlety they possess.”—SIR W. HAMILTON, _Discussions in Philosophy_.

Chapter I.

Of The Necessity Of Commencing With An Analysis Of Language.

§ 1. It is so much the established practice of writers on logic to commence their treatises by a few general observations (in most cases, it is true, rather meagre) on Terms and their varieties, that it will, perhaps, scarcely be required from me, in merely following the common usage, to be as particular in assigning my reasons, as it is usually expected that those should be who deviate from it.

The practice, indeed, is recommended by considerations far too obvious to require a formal justification. Logic is a portion of the Art of Thinking: Language is evidently, and by the admission of all philosophers, one of the principal instruments or helps of thought; and any imperfection in the instrument, or in the mode of employing it, is confessedly liable, still more than in almost any other art, to confuse and impede the process, and destroy all ground of confidence in the result. For a mind not previously versed in the meaning and right use of the various kinds of words, to attempt the study of methods of philosophizing, would be as if some one

should attempt to become an astronomical observer, having never learned to adjust the focal distance of his optical instruments so as to see distinctly.

Since Reasoning, or Inference, the principal subject of logic, is an operation which usually takes place by means of words, and in complicated cases can take place in no other way; those who have not a thorough insight into the signification and purposes of words, will be under chances, amounting almost to certainty, of reasoning or inferring incorrectly. And logicians have generally felt that unless, in the very first stage, they removed this source of error; unless they taught their pupil to put away the glasses which distort the object, and to use those which are adapted to his purpose in such a manner as to assist, not perplex, his vision; he would not be in a condition to practice the remaining part of their discipline with any prospect of advantage. Therefore it is that an inquiry into language, so far as is needful to guard against the errors to which it gives rise, has at all times been deemed a necessary preliminary to the study of logic.

But there is another reason, of a still more fundamental nature, why the import of words should be the earliest subject of the logician's consideration: because without it he can not examine into the import of Propositions. Now this is a subject which stands on the very threshold of the science of logic.

The object of logic, as defined in the Introductory Chapter, is to ascertain how we come by that portion of our knowledge (much the greatest portion) which is not intuitive: and by what criterion we can, in matters not self-evident, distinguish between things proved and things not proved, between what is worthy and what is unworthy of belief. Of the various questions which present themselves to our inquiring faculties, some receive an answer from direct consciousness, others, if resolved at all, can only be resolved by means of evidence. Logic is concerned with these last. But before inquiring into the mode of resolving questions, it is necessary to inquire what are those which offer themselves; what questions are conceivable; what inquiries are there, to which mankind have either obtained, or been able to imagine it possible that they should obtain, an answer. This point is best ascertained by a survey and analysis of Propositions.

§ 2. The answer to every question which it is possible to frame, must be contained in a Proposition, or Assertion. Whatever can be an object of belief, or even of disbelief, must, when put into words, assume the form of a proposition. All truth and all error lie in propositions. What, by a convenient misapplication of an abstract term, we call a Truth, means simply a True Proposition; and errors are false propositions. To know the import of all possible propositions would be to know all questions which can be raised, all matters which are susceptible of being either believed or disbelieved. How many kinds of inquiries can be propounded; how many kinds of judgments can be made; and how many kinds of propositions it is possible to frame with a meaning, are but different forms of one and the same question. Since, then, the objects of all Belief and of all Inquiry express themselves in propositions, a sufficient scrutiny of Propositions and of their varieties will apprise us what questions mankind have actually asked of themselves, and what, in the nature of answers to those questions, they have actually thought they had grounds to believe.

Now the first glance at a proposition shows that it is formed by putting together two names. A proposition, according to the common simple definition, which is sufficient for our purpose is, _discourse, in which something is affirmed or denied of something_. Thus, in the proposition, Gold is yellow, the quality yellow is affirmed of the substance _gold_. In the proposition, Franklin was not born in England, the fact expressed by the words _born in England_ is denied of the man Franklin.

Every proposition consists of three parts: the Subject, the Predicate, and the Copula. The predicate is the name denoting that which is affirmed or denied. The subject is the name denoting the person or thing which something is affirmed or denied of. The copula is the sign denoting that there is an affirmation or denial, and thereby enabling the hearer or reader to distinguish a proposition from any other kind of discourse. Thus, in the proposition, The earth is round, the Predicate is the word _round_, which denotes the quality affirmed, or (as the phrase is) predicated: _the earth_, words denoting the object which that quality is affirmed of, compose the Subject; the word _is_, which serves as the connecting mark between the subject and predicate, to show that one of them is affirmed of the other, is called the Copula.

Dismissing, for the present, the copula, of which more will be said hereafter, every proposition, then, consists of at least two names—brings together two names, in a particular manner. This is already a first step toward what we are in quest of. It appears from this, that for an act of belief, _one_ object is not sufficient; the simplest act of belief supposes, and has something to do with, _two_ objects—two names, to say the least; and (since the names must be names of something) two _namable things_. A large class of thinkers would cut the matter short by saying, two _ideas_. They would say, that the subject and predicate are both of them names of ideas; the idea of gold, for instance, and the idea of yellow; and that what takes place (or part of what takes place) in the

act of belief consists in bringing (as it is often expressed) one of these ideas under the other. But this we are not yet in a condition to say: whether such be the correct mode of describing the phenomenon, is an after consideration. The result with which for the present we must be contented, is, that in every act of belief _two_ objects are in some manner taken cognizance of; that there can be no belief claimed, or question propounded, which does not embrace two distinct (either material or intellectual) subjects of thought; each of them capable, or not, of being conceived by itself, but incapable of being believed by itself.

I may say, for instance, “the sun.” The word has a meaning, and suggests that meaning to the mind of any one who is listening to me. But suppose I ask him, Whether it is true: whether he believes it? He can give no answer. There is as yet nothing to believe, or to disbelieve. Now, however, let me make, of all possible assertions respecting the sun, the one which involves the least of reference to any object besides itself; let me say, “the sun exists.” Here, at once, is something which a person can say he believes. But here, instead of only one, we find two distinct objects of conception: the sun is one object; existence is another. Let it not be said that this second conception, existence, is involved in the first; for the sun may be conceived as no longer existing. “The sun” does not convey all the meaning that is conveyed by “the sun exists:” “my father” does not include all the meaning of “my father exists,” for he may be dead; “a round square” does not include the meaning of “a round square exists,” for it does not and can not exist. When I say “the sun,” “my father,” or a “round square,” I do not call upon the hearer for any belief or disbelief, nor can either the one or the other be afforded me; but if I say, “the sun exists,” “my father exists,” or “a round square exists,” I call for belief; and should, in the first of the three instances, meet with it; in the second, with belief or disbelief, as the case might be; in the third, with disbelief.

§ 3. This first step in the analysis of the object of belief, which, though so obvious, will be found to be not unimportant, is the only one which we shall find it practicable to make without a preliminary survey of language. If we attempt to proceed further in the same path, that is, to analyze any further the import of Propositions; we find forced upon us, as a subject of previous consideration, the import of Names. For every proposition consists of two names; and every proposition affirms or denies one of these names, of the other. Now what we do, what passes in our mind, when we affirm or deny two names of one another, must depend on what they are names of; since it is with reference to that, and not to the mere names themselves, that we make the affirmation or denial. Here, therefore, we find a new reason why the signification of names, and the relation generally between names and the things signified by them, must occupy the preliminary stage of the inquiry we are engaged in.

It may be objected that the meaning of names can guide us at most only to the opinions, possibly the foolish and groundless opinions, which mankind have formed concerning things, and that as the object of philosophy is truth, not opinion, the philosopher should dismiss words and look into things themselves, to ascertain what questions can be asked and answered in regard to them. This advice (which no one has it in his power to follow) is in reality an exhortation to discard the whole fruits of the labors of his predecessors, and conduct himself as if he were the first person who had ever turned an inquiring eye upon nature. What does any one’s personal knowledge of Things amount to, after subtracting all which he has acquired by means of the words of other people? Even after he has learned as much as people usually do learn from others, will the notions of things contained in his individual mind afford as sufficient a basis for a _catalogue raisonné_ as the notions which are in the minds of all mankind?

In any enumeration and classification of Things, which does not set out from their names, no varieties of things will of course be comprehended but those recognized by the particular inquirer; and it will still remain to be established, by a subsequent examination of names, that the enumeration has omitted nothing which ought to have been included. But if we begin with names, and use them as our clue to the things, we bring at once before us all the distinctions which have been recognized, not by a single inquirer, but by all inquirers taken together. It doubtless may, and I believe it will, be found, that mankind have multiplied the varieties unnecessarily, and have imagined distinctions among things, where there were only distinctions in the manner of naming them. But we are not entitled to assume this in the commencement. We must begin by recognizing the distinctions made by ordinary language. If some of these appear, on a close examination, not to be fundamental, the enumeration of the different kinds of realities may be abridged accordingly. But to impose upon the facts in the first instance the yoke of a theory, while the grounds of the theory are reserved for discussion in a subsequent stage, is not a course which a logician can reasonably adopt.

Chapter II.

Of Names.

§ 1. “A name,” says Hobbes,(7) “is a word taken at pleasure to serve for a mark which may raise in our mind a thought like to some thought we had before, and which being pronounced to others, may be to them a sign of what thought the speaker had(8) before in

his mind." This simple definition of a name, as a word (or set of words) serving the double purpose of a mark to recall to ourselves the likeness of a former thought, and a sign to make it known to others, appears unexceptionable. Names, indeed, do much more than this; but whatever else they do, grows out of, and is the result of this: as will appear in its proper place.

Are names more properly said to be the names of things, or of our ideas of things? The first is the expression in common use; the last is that of some metaphysicians, who conceived that in adopting it they were introducing a highly important distinction. The eminent thinker, just quoted, seems to countenance the latter opinion. "But seeing," he continues, "names ordered in speech (as is defined) are signs of our conceptions, it is manifest they are not signs of the things themselves; for that the sound of this word _stone_ should be the sign of a stone, can not be understood in any sense but this, that he that hears it collects that he that pronounces it thinks of a stone."

If it be merely meant that the conception alone, and not the thing itself, is recalled by the name, or imparted to the hearer, this of course can not be denied. Nevertheless, there seems good reason for adhering to the common usage, and calling (as indeed Hobbes himself does in other places) the word _sun_ the name of the sun, and not the name of our idea of the sun. For names are not intended only to make the hearer conceive what we conceive, but also to inform him what we believe. Now, when I use a name for the purpose of expressing a belief, it is a belief concerning the thing itself, not concerning my idea of it. When I say, "the sun is the cause of day," I do not mean that my idea of the sun causes or excites in me the idea of day; or in other words, that thinking of the sun makes me think of day. I mean, that a certain physical fact, which is called the sun's presence (and which, in the ultimate analysis, resolves itself into sensations, not ideas) causes another physical fact, which is called day. It seems proper to consider a word as the _name_ of that which we intend to be understood by it when we use it; of that which any fact that we assert of it is to be understood of; that, in short, concerning which, when we employ the word, we intend to give information. Names, therefore, shall always be spoken of in this work as the names of things themselves, and not merely of our ideas of things.

But the question now arises, of what things? and to answer this it is necessary to take into consideration the different kinds of names.

§ 2. It is usual, before examining the various classes into which names are commonly divided, to begin by distinguishing from names of every description, those words which are not names, but only parts of names. Among such are reckoned particles, as _of_, _to_, _truly_, _often_; the inflected cases of nouns substantive, as _me_, _him_, _John's_; and even adjectives, as _large_, _heavy_. These words do not express things of which any thing can be affirmed or denied. We can not say, Heavy fell, or A heavy fell; Truly, or A truly, was asserted; Of, or An of, was in the room. Unless, indeed, we are speaking of the mere words themselves, as when we say, Truly is an English word, or, Heavy is an adjective. In that case they are complete names—viz., names of those particular sounds, or of those particular collections of written characters. This employment of a word to denote the mere letters and syllables of which it is composed, was termed by the schoolmen the _suppositio materialis_ of the word. In any other sense we can not introduce one of these words into the subject of a proposition, unless in combination with other words; as, A heavy _body_ fell, A truly _important fact_ was asserted, A _member_ of _parliament_ was in the room.

An adjective, however, is capable of standing by itself as the predicate of a proposition; as when we say, Snow is white; and occasionally even as the subject, for we may say, White is an agreeable color. The adjective is often said to be so used by a grammatical ellipsis: Snow is white, instead of Snow is a white object; White is an agreeable color, instead of, A white color, or, The color white, is agreeable. The Greeks and Romans were allowed, by the rules of their language, to employ this ellipsis universally in the subject as well as in the predicate of a proposition. In English this can not, generally speaking, be done. We may say, The earth is round; but we can not say, Round is easily moved; we must say, A round object. This distinction, however, is rather grammatical than logical. Since there is no difference of meaning between _round_, and _a round object_, it is only custom which prescribes that on any given occasion one shall be used, and not the other. We shall, therefore, without scruple, speak of adjectives as names, whether in their own right, or as representative of the more circuitous forms of expression above exemplified. The other classes of subsidiary words have no title whatever to be considered as names. An adverb, or an accusative case, can not under any circumstances (except when their mere letters and syllables are spoken of) figure as one of the terms of a proposition.

Words which are not capable of being used as names, but only as parts of names, were called by some of the schoolmen Syncategorematic terms: from σ■ν, with, and κατηγορ■ω, to predicate, because it was only _with_ some other word that they could be predicated. A word which could be used either as the subject or predicate of a proposition without being accompanied by any other word, was termed by the same authorities a Categorematic term. A combination of one or more Categorematic, and one or more Syncategorematic words, as A heavy body, or A court of justice, they sometimes called a _mixed_ term; but this seems a

needless multiplication of technical expressions. A mixed term is, in the only useful sense of the word, Categorematic. It belongs to the class of what have been called many-worded names.

For, as one word is frequently not a name, but only part of a name, so a number of words often compose one single name, and no more. These words, “The place which the wisdom or policy of antiquity had destined for the residence of the Abyssinian princes,” form in the estimation of the logician only one name; one Categorematic term. A mode of determining whether any set of words makes only one name, or more than one, is by predicating something of it, and observing whether, by this predication, we make only one assertion or several. Thus, when we say, John Nokes, who was the mayor of the town, died yesterday—by this predication we make but one assertion; whence it appears that “John Nokes, who was the mayor of the town,” is no more than one name. It is true that in this proposition, besides the assertion that John Nokes died yesterday, there is included another assertion, namely, that John Nokes was mayor of the town. But this last assertion was already made: we did not make it by adding the predicate, “died yesterday.” Suppose, however, that the words had been, John Nokes _and_ the mayor of the town, they would have formed two names instead of one. For when we say, John Nokes and the mayor of the town died yesterday, we make two assertions: one, that John Nokes died yesterday; the other, that the mayor of the town died yesterday.

It being needless to illustrate at any greater length the subject of many-worded names, we proceed to the distinctions which have been established among names, not according to the words they are composed of, but according to their signification.

§ 3. All names are names of something, real or imaginary; but all things have not names appropriated to them individually. For some individual objects we require, and consequently have, separate distinguishing names; there is a name for every person, and for every remarkable place. Other objects, of which we have not occasion to speak so frequently, we do not designate by a name of their own; but when the necessity arises for naming them, we do so by putting together several words, each of which, by itself, might be and is used for an indefinite number of other objects; as when I say, _this stone_: “this” and “stone” being, each of them, names that may be used of many other objects besides the particular one meant, though the only object of which they can both be used at the given moment, consistently with their signification, may be the one of which I wish to speak.

Were this the sole purpose for which names, that are common to more things than one, could be employed; if they only served, by mutually limiting each other, to afford a designation for such individual objects as have no names of their own: they could only be ranked among contrivances for economizing the use of language. But it is evident that this is not their sole function. It is by their means that we are enabled to assert _general_ propositions; to affirm or deny any predicate of an indefinite number of things at once. The distinction, therefore, between _general_ names, and _individual_ or _singular_ names, is fundamental; and may be considered as the first grand division of names.

A general name is familiarly defined, a name which is capable of being truly affirmed, in the same sense, of each of an indefinite number of things. An individual or singular name is a name which is only capable of being truly affirmed, in the same sense, of one thing.

Thus, _man_ is capable of being truly affirmed of John, George, Mary, and other persons without assignable limit; and it is affirmed of all of them in the same sense; for the word man expresses certain qualities, and when we predicate it of those persons, we assert that they all possess those qualities. But _John_ is only capable of being truly affirmed of one single person, at least in the same sense. For, though there are many persons who bear that name, it is not conferred upon them to indicate any qualities, or any thing which belongs to them in common; and can not be said to be affirmed of them in any _sense_ at all, consequently not in the same sense. “The king who succeeded William the Conqueror,” is also an individual name. For, that there can not be more than one person of whom it can be truly affirmed, is implied in the meaning of the words. Even “_the_ king,” when the occasion or the context defines the individual of whom it is to be understood, may justly be regarded as an individual name.

It is not unusual, by way of explaining what is meant by a general name, to say that it is the name of a _class_. But this, though a convenient mode of expression for some purposes, is objectionable as a definition, since it explains the clearer of two things by the more obscure. It would be more logical to reverse the proposition, and turn it into a definition of the word _class_: “A class is the indefinite multitude of individuals denoted by a general name.”

It is necessary to distinguish _general_ from _collective_ names. A general name is one which can be predicated of _each_ individual of a multitude; a collective name can not be predicated of each separately, but only of all taken together. “The 76th regiment of foot in the British army,” which is a collective name, is not a general but an individual name; for though it can be predicated of a multitude of individual soldiers taken jointly, it can not be predicated of them severally. We may say, Jones is a

soldier, and Thompson is a soldier, and Smith is a soldier, but we can not say, Jones is the 76th regiment, and Thompson is the 76th regiment, and Smith is the 76th regiment. We can only say, Jones, and Thompson, and Smith, and Brown, and so forth (enumerating all the soldiers), are the 76th regiment.

“The 76th regiment” is a collective name, but not a general one: “a regiment” is both a collective and a general name. General with respect to all individual regiments, of each of which separately it can be affirmed: collective with respect to the individual soldiers of whom any regiment is composed.

§ 4. The second general division of names is into _concrete_ and _abstract_. A concrete name is a name which stands for a thing; an abstract name is a name which stands for an attribute of a thing. Thus _John_, _the sea_, _this table_, are names of things. _White_, also, is a name of a thing, or rather of things. Whiteness, again, is the name of a quality or attribute of those things. Man is a name of many things; humanity is a name of an attribute of those things. _Old_ is a name of things: _old age_ is a name of one of their attributes.

I have used the words concrete and abstract in the sense annexed to them by the schoolmen, who, notwithstanding the imperfections of their philosophy, were unrivaled in the construction of technical language, and whose definitions, in logic at least, though they never went more than a little way into the subject, have seldom, I think, been altered but to be spoiled. A practice, however, has grown up in more modern times, which, if not introduced by Locke, has gained currency chiefly from his example, of applying the expression “abstract name” to all names which are the result of abstraction or generalization, and consequently to all general names, instead of confining it to the names of attributes. The metaphysicians of the Condillac school—whose admiration of Locke, passing over the profoundest speculations of that truly original genius, usually fastens with peculiar eagerness upon his weakest points—have gone on imitating him in this abuse of language, until there is now some difficulty in restoring the word to its original signification. A more wanton alteration in the meaning of a word is rarely to be met with; for the expression _general name_, the exact equivalent of which exists in all languages I am acquainted with, was already available for the purpose to which _abstract_ has been misappropriated, while the misappropriation leaves that important class of words, the names of attributes, without any compact distinctive appellation. The old acceptation, however, has not gone so completely out of use as to deprive those who still adhere to it of all chance of being understood. By _abstract_, then, I shall always, in Logic proper, mean the opposite of _concrete_; by an abstract name, the name of an attribute; by a concrete name, the name of an object.

Do abstract names belong to the class of general, or to that of singular names? Some of them are certainly general. I mean those which are names not of one single and definite attribute, but of a class of attributes. Such is the word _color_, which is a name common to whiteness, redness, etc. Such is even the word whiteness, in respect of the different shades of whiteness to which it is applied in common: the word magnitude, in respect of the various degrees of magnitude and the various dimensions of space; the word weight, in respect of the various degrees of weight. Such also is the word _attribute_ itself, the common name of all particular attributes. But when only one attribute, neither variable in degree nor in kind, is designated by the name; as visibleness; tangibleness; equality; squareness; milk-whiteness; then the name can hardly be considered general; for though it denotes an attribute of many different objects, the attribute itself is always conceived as one, not many.(9) To avoid needless logomachies, the best course would probably be to consider these names as neither general nor individual, and to place them in a class apart.

It may be objected to our definition of an abstract name, that not only the names which we have called abstract, but adjectives, which we have placed in the concrete class, are names of attributes; that _white_, for example, is as much the name of the color as _whiteness_ is. But (as before remarked) a word ought to be considered as the name of that which we intend to be understood by it when we put it to its principal use, that is, when we employ it in predication. When we say snow is white, milk is white, linen is white, we do not mean it to be understood that snow, or linen, or milk, is a color. We mean that they are things having the color. The reverse is the case with the word whiteness; what we affirm to _be_ whiteness is not snow, but the color of snow. Whiteness, therefore, is the name of the color exclusively: white is a name of all things whatever having the color; a name, not of the quality whiteness, but of every white object. It is true, this name was given to all those various objects on account of the quality; and we may therefore say, without impropriety, that the quality forms part of its signification; but a name can only be said to stand for, or to be a name of, the things of which it can be predicated. We shall presently see that all names which can be said to have any signification, all names by applying which to an individual we give any information respecting that individual, may be said to _imply_ an attribute of some sort; but they are not names of the attribute; it has its own proper abstract name.

§ 5. This leads to the consideration of a third great division of names, into _connotative_ and _non-connotative_, the latter sometimes, but improperly, called _absolute_. This is one of the most important distinctions which we shall have occasion to point

out, and one of those which go deepest into the nature of language.

A non-connotative term is one which signifies a subject only, or an attribute only. A connotative term is one which denotes a subject, and implies an attribute. By a subject is here meant any thing which possesses attributes. Thus John, or London, or England, are names which signify a subject only. Whiteness, length, virtue, signify an attribute only. None of these names, therefore, are connotative. But _white_, _long_, _virtuous_, are connotative. The word white, denotes all white things, as snow, paper, the foam of the sea, etc., and implies, or in the language of the schoolmen, _connotes_,(10) the attribute _whiteness_. The word white is not predicated of the attribute, but of the subjects, snow, etc.; but when we predicate it of them, we convey the meaning that the attribute whiteness belongs to them. The same may be said of the other words above cited. Virtuous, for example, is the name of a class, which includes Socrates, Howard, the Man of Ross, and an undefinable number of other individuals, past, present, and to come. These individuals, collectively and severally, can alone be said with propriety to be denoted by the word: of them alone can it properly be said to be a name. But it is a name applied to all of them in consequence of an attribute which they are supposed to possess in common, the attribute which has received the name of virtue. It is applied to all beings that are considered to possess this attribute; and to none which are not so considered.

All concrete general names are connotative. The word _man_, for example, denotes Peter, Jane, John, and an indefinite number of other individuals, of whom, taken as a class, it is the name. But it is applied to them, because they possess, and to signify that they possess, certain attributes. These seem to be, corporeity, animal life, rationality, and a certain external form, which for distinction we call the human. Every existing thing, which possessed all these attributes, would be called a man; and any thing which possessed none of them, or only one, or two, or even three of them without the fourth, would not be so called. For example, if in the interior of Africa there were to be discovered a race of animals possessing reason equal to that of human beings, but with the form of an elephant, they would not be called men. Swift's Houyhnhnms would not be so called. Or if such newly-discovered beings possessed the form of man without any vestige of reason, it is probable that some other name than that of man would be found for them. How it happens that there can be any doubt about the matter, will appear hereafter. The word _man_, therefore, signifies all these attributes, and all subjects which possess these attributes. But it can be predicated only of the subjects. What we call men, are the subjects, the individual Stiles and Nokes; not the qualities by which their humanity is constituted. The name, therefore, is said to signify the subjects _directly_, the attributes _indirectly_; it _denotes_ the subjects, and implies, or involves, or indicates, or as we shall say henceforth _connotes_, the attributes. It is a connotative name.

Connotative names have hence been also called _denominative_, because the subject which they denote is denominated by, or receives a name from the attribute which they connote. Snow, and other objects, receive the name white, because they possess the attribute which is called whiteness; Peter, James, and others receive the name man because they possess the attributes which are considered to constitute humanity. The attribute, or attributes, may therefore be said to denominate those objects, or to give them a common name.(11)

It has been seen that all concrete general names are connotative. Even abstract names, though the names only of attributes, may in some instances be justly considered as connotative; for attributes themselves may have attributes ascribed to them; and a word which denotes attributes may connote an attribute of those attributes. Of this description, for example, is such a word as _fault_; equivalent to _bad_ or _hurtful quality_. This word is a name common to many attributes, and connotes hurtfulness, an attribute of those various attributes. When, for example, we say that slowness, in a horse, is a fault, we do not mean that the slow movement, the actual change of pace of the slow horse, is a bad thing, but that the property or peculiarity of the horse, from which it derives that name, the quality of being a slow mover, is an undesirable peculiarity.

In regard to those concrete names which are not general but individual, a distinction must be made.

Proper names are not connotative: they denote the individuals who are called by them; but they do not indicate or imply any attributes as belonging to those individuals. When we name a child by the name Paul, or a dog by the name Cæsar, these names are simply marks used to enable those individuals to be made subjects of discourse. It may be said, indeed, that we must have had some reason for giving them those names rather than any others; and this is true; but the name, once given, is independent of the reason. A man may have been named John, because that was the name of his father; a town may have been named Dartmouth, because it is situated at the mouth of the Dart. But it is no part of the signification of the word John, that the father of the person so called bore the same name; nor even of the word Dartmouth, to be situated at the mouth of the Dart. If sand should choke up the mouth of the river, or an earthquake change its course, and remove it to a distance from the town, the name of the town would not necessarily be changed. That fact, therefore, can form no part of the signification of the word; for otherwise, when the fact

confessedly ceased to be true, no one would any longer think of applying the name. Proper names are attached to the objects themselves, and are not dependent on the continuance of any attribute of the object.

But there is another kind of names, which, although they are individual names—that is, predicable only of one object—are really connotative. For, though we may give to an individual a name utterly unmeaning, which we call a proper name—a word which answers the purpose of showing what thing it is we are talking about, but not of telling any thing about it; yet a name peculiar to an individual is not necessarily of this description. It may be significant of some attribute, or some union of attributes, which, being possessed by no object but one, determines the name exclusively to that individual. “The sun” is a name of this description; “God,” when used by a monotheist, is another. These, however, are scarcely examples of what we are now attempting to illustrate, being, in strictness of language, general, not individual names: for, however they may be _in fact_ predicable only of one object, there is nothing in the meaning of the words themselves which implies this: and, accordingly, when we are imagining and not affirming, we may speak of many suns; and the majority of mankind have believed, and still believe, that there are many gods. But it is easy to produce words which are real instances of connotative individual names. It may be part of the meaning of the connotative name itself, that there can exist but one individual possessing the attribute which it connotes: as, for instance, “the _only_ son of John Stiles;” “the _first_ emperor of Rome.” Or the attribute connoted may be a connection with some determinate event, and the connection may be of such a kind as only one individual could have; or may at least be such as only one individual actually had; and this may be implied in the form of the expression. “The father of Socrates” is an example of the one kind (since Socrates could not have had two fathers); “the author of the Iliad,” “the murderer of Henri Quatre,” of the second. For, though it is conceivable that more persons than one might have participated in the authorship of the Iliad, or in the murder of Henri Quatre, the employment of the article _the_ implies that, in fact, this was not the case. What is here done by the word _the_, is done in other cases by the context: thus, “Cæsar’s army” is an individual name, if it appears from the context that the army meant is that which Cæsar commanded in a particular battle. The still more general expressions, “the Roman army,” or “the Christian army,” may be individualized in a similar manner. Another case of frequent occurrence has already been noticed; it is the following: The name, being a many-worded one, may consist, in the first place, of a _general_ name, capable therefore in itself of being affirmed of more things than one, but which is, in the second place, so limited by other words joined with it, that the entire expression can only be predicated of one object, consistently with the meaning of the general term. This is exemplified in such an instance as the following: “the present prime minister of England.” Prime Minister of England is a general name; the attributes which it connotes may be possessed by an indefinite number of persons: in succession however, not simultaneously; since the meaning of the name itself imports (among other things) that there can be only one such person at a time. This being the case, and the application of the name being afterward limited by the article and the word _present_, to such individuals as possess the attributes at one indivisible point of time, it becomes applicable only to one individual. And as this appears from the meaning of the name, without any extrinsic proof, it is strictly an individual name.

From the preceding observations it will easily be collected, that whenever the names given to objects convey any information—that is, whenever they have properly any meaning—the meaning resides not in what they _denote_, but in what they _connote_. The only names of objects which connote nothing are _proper_ names; and these have, strictly speaking, no signification.(12)

If, like the robber in the Arabian Nights, we make a mark with chalk on a house to enable us to know it again, the mark has a purpose, but it has not properly any meaning. The chalk does not declare any thing about the house; it does not mean, This is such a person’s house, or This is a house which contains booty. The object of making the mark is merely distinction. I say to myself, All these houses are so nearly alike that if I lose sight of them I shall not again be able to distinguish that which I am now looking at, from any of the others; I must therefore contrive to make the appearance of this one house unlike that of the others, that I may hereafter know when I see the mark—not indeed any attribute of the house—but simply that it is the same house which I am now looking at. Morgiana chalked all the other houses in a similar manner, and defeated the scheme: how? simply by obliterating the difference of appearance between that house and the others. The chalk was still there, but it no longer served the purpose of a distinctive mark.

When we impose a proper name, we perform an operation in some degree analogous to what the robber intended in chalking the house. We put a mark, not indeed upon the object itself, but, so to speak, upon the idea of the object. A proper name is but an unmeaning mark which we connect in our minds with the idea of the object, in order that whenever the mark meets our eyes or occurs to our thoughts, we may think of that individual object. Not being attached to the thing itself, it does not, like the chalk, enable us to distinguish the object when we see it; but it enables us to distinguish it when it is spoken of, either in the records of our own experience, or in the discourse of others; to know that what we find asserted in any proposition of which it is the subject, is

asserted of the individual thing with which we were previously acquainted.

When we predicate of any thing its proper name; when we say, pointing to a man, this is Brown or Smith, or pointing to a city, that it is York, we do not, merely by so doing, convey to the reader any information about them, except that those are their names. By enabling him to identify the individuals, we may connect them with information previously possessed by him; by saying, This is York, we may tell him that it contains the Minster. But this is in virtue of what he has previously heard concerning York; not by any thing implied in the name. It is otherwise when objects are spoken of by connotative names. When we say, The town is built of marble, we give the hearer what may be entirely new information, and this merely by the signification of the many-worded connotative name, “built of marble.” Such names are not signs of the mere objects, invented because we have occasion to think and speak of those objects individually; but signs which accompany an attribute; a kind of livery in which the attribute clothes all objects which are recognized as possessing it. They are not mere marks, but more, that is to say, significant marks; and the connotation is what constitutes their significance.

As a proper name is said to be the name of the one individual which it is predicated of, so (as well from the importance of adhering to analogy, as for the other reasons formerly assigned) a connotative name ought to be considered a name of all the various individuals which it is predicable of, or in other words _denotes_, and not of what it connotes. But by learning what things it is a name of, we do not learn the meaning of the name: for to the same thing we may, with equal propriety, apply many names, not equivalent in meaning. Thus, I call a certain man by the name Sophroniscus: I call him by another name, The father of Socrates. Both these are names of the same individual, but their meaning is altogether different; they are applied to that individual for two different purposes: the one, merely to distinguish him from other persons who are spoken of; the other to indicate a fact relating to him, the fact that Socrates was his son. I further apply to him these other expressions: a man, a Greek, an Athenian, a sculptor, an old man, an honest man, a brave man. All these are, or may be, names of Sophroniscus, not indeed of him alone, but of him and each of an indefinite number of other human beings. Each of these names is applied to Sophroniscus for a different reason, and by each whoever understands its meaning is apprised of a distinct fact or number of facts concerning him; but those who knew nothing about the names except that they were applicable to Sophroniscus, would be altogether ignorant of their meaning. It is even possible that I might know every single individual of whom a given name could be with truth affirmed, and yet could not be said to know the meaning of the name. A child knows who are its brothers and sisters, long before it has any definite conception of the nature of the facts which are involved in the signification of those words.

In some cases it is not easy to decide precisely how much a particular word does or does not connote; that is, we do not exactly know (the case not having arisen) what degree of difference in the object would occasion a difference in the name. Thus, it is clear that the word man, besides animal life and rationality, connotes also a certain external form; but it would be impossible to say precisely what form; that is, to decide how great a deviation from the form ordinarily found in the beings whom we are accustomed to call men, would suffice in a newly-discovered race to make us refuse them the name of man. Rationality, also, being a quality which admits of degrees, it has never been settled what is the lowest degree of that quality which would entitle any creature to be considered a human being. In all such cases, the meaning of the general name is so far unsettled and vague; mankind have not come to any positive agreement about the matter. When we come to treat of Classification, we shall have occasion to show under what conditions this vagueness may exist without practical inconvenience; and cases will appear in which the ends of language are better promoted by it than by complete precision; in order that, in natural history for instance, individuals or species of no very marked character may be ranged with those more strongly characterized individuals or species to which, in all their properties taken together, they bear the nearest resemblance.

But this partial uncertainty in the connotation of names can only be free from mischief when guarded by strict precautions. One of the chief sources, indeed, of lax habits of thought, is the custom of using connotative terms without a distinctly ascertained connotation, and with no more precise notion of their meaning than can be loosely collected from observing what objects they are used to denote. It is in this manner that we all acquire, and inevitably so, our first knowledge of our vernacular language. A child learns the meaning of the words _man_, or _white_, by hearing them applied to a variety of individual objects, and finding out, by a process of generalization and analysis which he could not himself describe, what those different objects have in common. In the case of these two words the process is so easy as to require no assistance from culture; the objects called human beings, and the objects called white, differing from all others by qualities of a peculiarly definite and obvious character. But in many other cases, objects bear a general resemblance to one another, which leads to their being familiarly classed together under a common name, while, without more analytic habits than the generality of mankind possess, it is not immediately apparent what are the particular attributes, upon the possession of which in common by them all, their general resemblance depends. When this is the case, people

use the name without any recognized connotation, that is, without any precise meaning; they talk, and consequently think, vaguely, and remain contented to attach only the same degree of significance to their own words, which a child three years old attaches to the words brother and sister. The child at least is seldom puzzled by the starting up of new individuals, on whom he is ignorant whether or not to confer the title; because there is usually an authority close at hand competent to solve all doubts. But a similar resource does not exist in the generality of cases; and new objects are continually presenting themselves to men, women, and children, which they are called upon to class _proprio motu_. They, accordingly, do this on no other principle than that of superficial similarity, giving to each new object the name of that familiar object, the idea of which it most readily recalls, or which, on a cursory inspection, it seems to them most to resemble: as an unknown substance found in the ground will be called, according to its texture, earth, sand, or a stone. In this manner, names creep on from subject to subject, until all traces of a common meaning sometimes disappear, and the word comes to denote a number of things not only independently of any common attribute, but which have actually no attribute in common; or none but what is shared by other things to which the name is capriciously refused.(13) Even scientific writers have aided in this perversion of general language from its purpose; sometimes because, like the vulgar, they knew no better; and sometimes in deference to that aversion to admit new words, which induces mankind, on all subjects not considered technical, to attempt to make the original stock of names serve with but little augmentation to express a constantly increasing number of objects and distinctions, and, consequently, to express them in a manner progressively more and more imperfect.

To what a degree this loose mode of classing and denominating objects has rendered the vocabulary of mental and moral philosophy unfit for the purposes of accurate thinking, is best known to whoever has most meditated on the present condition of those branches of knowledge. Since, however, the introduction of a new technical language as the vehicle of speculations on subjects belonging to the domain of daily discussion, is extremely difficult to effect, and would not be free from inconvenience even if effected, the problem for the philosopher, and one of the most difficult which he has to resolve, is, in retaining the existing phraseology, how best to alleviate its imperfections. This can only be accomplished by giving to every general concrete name which there is frequent occasion to predicate, a definite and fixed connotation; in order that it may be known what attributes, when we call an object by that name, we really mean to predicate of the object. And the question of most nicety is, how to give this fixed connotation to a name, with the least possible change in the objects which the name is habitually employed to denote; with the least possible disarrangement, either by adding or subtraction, of the group of objects which, in however imperfect a manner, it serves to circumscribe and hold together; and with the least vitiation of the truth of any propositions which are commonly received as true.

This desirable purpose, of giving a fixed connotation where it is wanting, is the end aimed at whenever any one attempts to give a definition of a general name already in use; every definition of a connotative name being an attempt either merely to declare, or to declare and analyze, the connotation of the name. And the fact, that no questions which have arisen in the moral sciences have been subjects of keener controversy than the definitions of almost all the leading expressions, is a proof how great an extent the evil to which we have adverted has attained.

Names with indeterminate connotation are not to be confounded with names which have more than one connotation, that is to say, ambiguous words. A word may have several meanings, but all of them fixed and recognized ones; as the word _post_, for example, or the word _box_, the various senses of which it would be endless to enumerate. And the paucity of existing names, in comparison with the demand for them, may often render it advisable and even necessary to retain a name in this multiplicity of acceptations, distinguishing these so clearly as to prevent their being confounded with one another. Such a word may be considered as two or more names, accidentally written and spoken alike.(14)

§ 6. The fourth principal division of names, is into _positive_ and _negative_. Positive, as _man_, _tree_, _good_; negative, as _not-man_, _not-tree_, _not-good_. To every positive concrete name, a corresponding negative one might be framed. After giving a name to any one thing, or to any plurality of things, we might create a second name which should be a name of all things whatever, except that particular thing or things. These negative names are employed whenever we have occasion to speak collectively of all things other than some thing or class of things. When the positive name is connotative, the corresponding negative name is connotative likewise; but in a peculiar way, connoting not the presence but the absence of an attribute. Thus, _not-white_ denotes all things whatever except white things; and connotes the attribute of not possessing whiteness. For the non-possession of any given attribute is also an attribute, and may receive a name as such; and thus negative concrete names may obtain negative abstract names to correspond to them.(15)

Names which are positive in form are often negative in reality, and others are really positive though their form is negative. The word _inconvenient_, for example, does not express the mere absence of convenience; it expresses a positive attribute—that of being the cause of discomfort or annoyance. So the word _unpleasant_, notwithstanding its negative form, does not connote the mere absence of pleasantness, but a less degree of what is signified by the word _painful_, which, it is hardly necessary to say, is positive. _Idle_, on the other hand, is a word which, though positive in form, expresses nothing but what would be signified either by the phrase _not working_, or by the phrase _not disposed to work_; and _sober_, either by _not drunk_ or by _not drunken_.

There is a class of names called _privative_. A privative name is equivalent in its signification to a positive and a negative name taken together; being the name of something which has once had a particular attribute, or for some other reason might have been expected to have it, but which has it not. Such is the word _blind_, which is not equivalent to _not seeing_, or to _not capable of seeing_, for it would not, except by a poetical or rhetorical figure, be applied to stocks and stones. A thing is not usually said to be blind, unless the class to which it is most familiarly referred, or to which it is referred on the particular occasion, be chiefly composed of things which can see, as in the case of a blind man, or a blind horse; or unless it is supposed for any reason that it ought to see; as in saying of a man, that he rushed blindly into an abyss, or of philosophers or the clergy that the greater part of them are blind guides. The names called privative, therefore, connote two things; the absence of certain attributes, and the presence of others, from which the presence also of the former might naturally have been expected.

§ 7. The fifth leading division of names is into _relative_ and _absolute_, or let us rather say, _relative_ and _non-relative_; for the word absolute is put upon much too hard duty in metaphysics, not to be willingly spared when its services can be dispensed with. It resembles the word _civil_ in the language of jurisprudence, which stands for the opposite of criminal, the opposite of ecclesiastical, the opposite of military, the opposite of political—in short, the opposite of any positive word which wants a negative.

Relative names are such as father, son; ruler, subject; like; equal; unlike; unequal; longer, shorter; cause, effect. Their characteristic property is, that they are always given in pairs. Every relative name which is predicated of an object, supposes another object (or objects), of which we may predicate either that same name or another relative name which is said to be the _correlative_ of the former. Thus, when we call any person a son, we suppose other persons who must be called parents. When we call any event a cause, we suppose another event which is an effect. When we say of any distance that it is longer, we suppose another distance which is shorter. When we say of any object that it is like, we mean that it is like some other object, which is also said to be like the first. In this last case both objects receive the same name; the relative term is its own correlative.

It is evident that these words, when concrete, are, like other concrete general names, connotative; they denote a subject, and connote an attribute; and each of them has, or might have, a corresponding abstract name, to denote the attribute connoted by the concrete. Thus the concrete _like_ has its abstract _likeness_; the concretes, father and son, have, or might have, the abstracts, paternity, and filiety, or sonship. The concrete name connotes an attribute, and the abstract name which answers to it denotes that attribute. But of what nature is the attribute? Wherein consists the peculiarity in the connotation of a relative name?

The attribute signified by a relative name, say some, is a relation; and this they give, if not as a sufficient explanation, at least as the only one attainable. If they are asked, What then is a relation? they do not profess to be able to tell. It is generally regarded as something peculiarly recondite and mysterious. I can not, however, perceive in what respect it is more so than any other attribute; indeed, it appears to me to be so in a somewhat less degree. I conceive rather, that it is by examining into the signification of relative names, or, in other words, into the nature of the attribute which they connote, that a clear insight may best be obtained into the nature of all attributes: of all that is meant by an attribute.

It is obvious, in fact, that if we take any two correlative names, _father_ and _son_ for instance, though the objects _de_noted by the names are different, they both, in a certain sense, connote the same thing. They can not, indeed, be said to connote the same _attribute_: to be a father, is not the same thing as to be a son. But when we call one man a father, another a son, what we mean to affirm is a set of facts, which are exactly the same in both cases. To predicate of A that he is the father of B, and of B that he is the son of A, is to assert one and the same fact in different words. The two propositions are exactly equivalent: neither of them asserts more or asserts less than the other. The paternity of A and the filiety of B are not two facts, but two modes of expressing the same fact. That fact, when analysed, consists of a series of physical events or phenomena, in which both A and B are parties concerned, and from which they both derive names. What those names really connote, is this series of events: that is the meaning, and the whole meaning, which either of them is intended to convey. The series of events may be said to _constitute_ the relation; the schoolmen called it the foundation of the relation, _fundamentum relationis_.

In this manner any fact, or series of facts, in which two different objects are implicated, and which is therefore predicable of both of them, may be either considered as constituting an attribute of the one, or an attribute of the other. According as we consider it in the former, or in the latter aspect, it is connoted by the one or the other of the two correlative names. _Father_ connotes the fact, regarded as constituting an attribute of A; _son_ connotes the same fact, as constituting an attribute of B. It may evidently be regarded with equal propriety in either light. And all that appears necessary to account for the existence of relative names, is, that whenever there is a fact in which two individuals are concerned, an attribute grounded on that fact may be ascribed to either of these individuals.

A name, therefore, is said to be relative, when, over and above the object which it denotes, it implies in its signification the existence of another object, also deriving a denomination from the same fact which is the ground of the first name. Or (to express the same meaning in other words) a name is relative, when, being the name of one thing, its signification can not be explained but by mentioning another. Or we may state it thus—when the name can not be employed in discourse so as to have a meaning, unless the name of some other thing than what it is itself the name of, be either expressed or understood. These definitions are all, at bottom, equivalent, being modes of variously expressing this one distinctive circumstance—that every other attribute of an object might, without any contradiction, be conceived still to exist if no object besides that one had ever existed;(16) but those of its attributes which are expressed by relative names, would on that supposition be swept away.

§ 8. Names have been further distinguished into _univocal_ and _æquivocal_: these, however, are not two kinds of names, but two different modes of employing names. A name is univocal, or applied univocally, with respect to all things of which it can be predicated _in the same sense_; it is æquivocal, or applied æquivocally, as respects those things of which it is predicated in different senses. It is scarcely necessary to give instances of a fact so familiar as the double meaning of a word. In reality, as has been already observed, an æquivocal or ambiguous word is not one name, but two names, accidentally coinciding in sound. _File_ meaning a steel instrument, and _file_ meaning a line of soldiers, have no more title to be considered one word, because written alike, than _grease_ and _Greece_ have, because they are pronounced alike. They are one sound, appropriated to form two different words.

An intermediate case is that of a name used _analogically_ or metaphorically; that is, a name which is predicated of two things, not univocally, or exactly in the same signification, but in significations somewhat similar, and which being derived one from the other, one of them may be considered the primary, and the other a secondary signification. As when we speak of a brilliant light and a brilliant achievement. The word is not applied in the same sense to the light and to the achievement; but having been applied to the light in its original sense, that of brightness to the eye, it is transferred to the achievement in a derivative signification, supposed to be somewhat like the primitive one. The word, however, is just as properly two names instead of one, in this case, as in that of the most perfect ambiguity. And one of the commonest forms of fallacious reasoning arising from ambiguity, is that of arguing from a metaphorical expression as if it were literal; that is, as if a word, when applied metaphorically, were the same name as when taken in its original sense: which will be seen more particularly in its place.

Chapter III.

Of The Things Denoted By Names.

§ 1. Looking back now to the commencement of our inquiry, let us attempt to measure how far it has advanced. Logic, we found, is the Theory of Proof. But proof supposes something provable, which must be a Proposition or Assertion; since nothing but a Proposition can be an object of belief, or therefore of proof. A Proposition is, discourse which affirms or denies something of some other thing. This is one step: there must, it seems, be two things concerned in every act of belief. But what are these Things? They can be no other than those signified by the two names, which being joined together by a copula constitute the Proposition. If, therefore, we knew what all names signify, we should know every thing which, in the existing state of human knowledge, is capable either of being made a subject of affirmation or denial, or of being itself affirmed or denied of a subject. We have accordingly, in the preceding chapter, reviewed the various kinds of Names, in order to ascertain what is signified by each of them. And we have now carried this survey far enough to be able to take an account of its results, and to exhibit an enumeration of all kinds of Things which are capable of being made predicates, or of having any thing predicated of them: after which to determine the import of Predication, that is, of Propositions, can be no arduous task.

The necessity of an enumeration of Existences, as the basis of Logic, did not escape the attention of the schoolmen, and of their master Aristotle, the most comprehensive, if not also the most sagacious, of the ancient philosophers. The Categories, or

Predicaments—the former a Greek word, the latter its literal translation in the Latin language—were believed to be an enumeration of all things capable of being named; an enumeration by the _summa genera_, _i.e._, the most extensive classes into which things could be distributed; which, therefore, were so many highest Predicates, one or other of which was supposed capable of being affirmed with truth of every namable thing whatsoever. The following are the classes into which, according to this school of philosophy, Things in general might be reduced:

Ο■σ■α, Substantia. Ποσ■ν, Quantitas. Ποι■ν, Qualitas. Πρ■ς τι, Relatio. Ποιε■ν, Actio. Π■σχειν, Passio. Πο■, Ubi. Π■τε, Quando. Κε■σθακ, Situs. ■χειν, Habitus.

The imperfections of this classification are too obvious to require, and its merits are not sufficient to reward, a minute examination. It is a mere catalogue of the distinctions rudely marked out by the language of familiar life, with little or no attempt to penetrate, by philosophic analysis, to the _rationale_ even of those common distinctions. Such an analysis, however superficially conducted, would have shown the enumeration to be both redundant and defective. Some objects are omitted, and others repeated several times under different heads. It is like a division of animals into men, quadrupeds, horses, asses, and ponies. That, for instance, could not be a very comprehensive view of the nature of Relation which could exclude action, passivity, and local situation from that category. The same observation applies to the categories Quando (or position in time), and Ubi (or position in space); while the distinction between the latter and Situs is merely verbal. The incongruity of erecting into a _summum genus_ the class which forms the tenth category is manifest. On the other hand, the enumeration takes no notice of any thing besides substances and attributes. In what category are we to place sensations, or any other feelings and states of mind; as hope, joy, fear; sound, smell, taste; pain, pleasure; thought, judgment, conception, and the like? Probably all these would have been placed by the Aristotelian school in the categories of _actio_ and _passio_; and the relation of such of them as are active, to their objects, and of such of them as are passive, to their causes, would rightly be so placed; but the things themselves, the feelings or states of mind, wrongly. Feelings, or states of consciousness, are assuredly to be accounted among realities, but they can not be reckoned either among substances or attributes.(17)

§ 2. Before recommencing, under better auspices, the attempt made with such imperfect success by the early logicians, we must take notice of an unfortunate ambiguity in all the concrete names which correspond to the most general of all abstract terms, the word Existence. When we have occasion for a name which shall be capable of denoting whatever exists, as contradistinguished from non-entity or Nothing, there is hardly a word applicable to the purpose which is not also, and even more familiarly, taken in a sense in which it denotes only substances. But substances are not all that exists; attributes, if such things are to be spoken of, must be said to exist; feelings certainly exist. Yet when we speak of an _object_, or of a _thing_, we are almost always supposed to mean a substance. There seems a kind of contradiction in using such an expression as that one _thing_ is merely an attribute of another thing. And the announcement of a Classification of Things would, I believe, prepare most readers for an enumeration like those in natural history, beginning with the great divisions of animal, vegetable, and mineral, and subdividing them into classes and orders. If, rejecting the word Thing, we endeavor to find another of a more general import, or at least more exclusively confined to that general import, a word denoting all that exists, and connoting only simple existence; no word might be presumed fitter for such a purpose than _being_: originally the present participle of a verb which in one of its meanings is exactly equivalent to the verb _exists_; and therefore suitable, even by its grammatical formation, to be the concrete of the abstract _existence_. But this word, strange as the fact may appear, is still more completely spoiled for the purpose which it seemed expressly made for, than the word Thing. _Being_ is, by custom, exactly synonymous with substance; except that it is free from a slight taint of a second ambiguity; being implied impartially to matter and to mind, while substance, though originally and in strictness applicable to both, is apt to suggest in preference the idea of matter. Attributes are never called Beings; nor are feelings. A Being is that which excites feelings, and which possesses attributes. The soul is called a Being; God and angels are called Beings; but if we were to say, extension, color, wisdom, virtue, are beings, we should perhaps be suspected of thinking with some of the ancients, that the cardinal virtues are animals; or, at the least, of holding with the Platonic school the doctrine of self-existent Ideas, or with the followers of Epicurus that of Sensible Forms, which detach themselves in every direction from bodies, and by coming in contact with our organs, cause our perceptions. We should be supposed, in short, to believe that Attributes are Substances.

In consequence of this perversion of the word Being, philosophers looking about for something to supply its place, laid their hands upon the word Entity, a piece of barbarous Latin, invented by the schoolmen to be used as an abstract name, in which class its grammatical form would seem to place it: but being seized by logicians in distress to stop a leak in their terminology, it has ever since been used as a concrete name. The kindred word _essence_, born at the same time and of the same parents, scarcely underwent a more complete transformation when, from being the abstract of the verb _to be_, it came to denote something

sufficiently concrete to be inclosed in a glass bottle. The word Entity, since it settled down into a concrete name, has retained its universality of signification somewhat less impaired than any of the names before mentioned. Yet the same gradual decay to which, after a certain age, all the language of psychology seems liable, has been at work even here. If you call virtue an _entity_, you are indeed somewhat less strongly suspected of believing it to be a substance than if you called it a _being_; but you are by no means free from the suspicion. Every word which was originally intended to connote mere existence, seems, after a time, to enlarge its connotation to _separate_ existence, or existence freed from the condition of belonging to a substance; which condition being precisely what constitutes an attribute, attributes are gradually shut out; and along with them feelings, which in ninety-nine cases out of a hundred have no other name than that of the attribute which is grounded on them. Strange that when the greatest embarrassment felt by all who have any considerable number of thoughts to express, is to find a sufficient variety of precise words fitted to express them, there should be no practice to which even scientific thinkers are more addicted than that of taking valuable words to express ideas which are sufficiently expressed by other words already appropriated to them.

When it is impossible to obtain good tools, the next best thing is to understand thoroughly the defects of those we have. I have therefore warned the reader of the ambiguity of the names which, for want of better, I am necessitated to employ. It must now be the writer's endeavor so to employ them as in no case to leave the meaning doubtful or obscure. No one of the above terms being altogether unambiguous, I shall not confine myself to any one, but shall employ on each occasion the word which seems least likely in the particular case to lead to misunderstanding; nor do I pretend to use either these or any other words with a rigorous adherence to one single sense. To do so would often leave us without a word to express what is signified by a known word in some one or other of its senses: unless authors had an unlimited license to coin new words, together with (what it would be more difficult to assume) unlimited power of making readers understand them. Nor would it be wise in a writer, on a subject involving so much of abstraction, to deny himself the advantage derived from even an improper use of a term, when, by means of it, some familiar association is called up which brings the meaning home to the mind, as it were by a flash.

The difficulty both to the writer and reader, of the attempt which must be made to use vague words so as to convey a precise meaning, is not wholly a matter of regret. It is not unfitting that logical treatises should afford an example of that, to facilitate which is among the most important uses of logic. Philosophical language will for a long time, and popular language still longer, retain so much of vagueness and ambiguity, that logic would be of little value if it did not, among its other advantages, exercise the understanding in doing its work neatly and correctly with these imperfect tools.

After this preamble it is time to proceed to our enumeration. We shall commence with Feelings, the simplest class of namable things; the term Feeling being of course understood in its most enlarged sense.

I. Feelings, Or States of Consciousness.

§ 3. A Feeling and a State of consciousness are, in the language of philosophy, equivalent expressions: every thing is a feeling of which the mind is conscious; every thing which it _feels_, or, in other words, which forms a part of its own sentient existence. In popular language Feeling is not always synonymous with State of Consciousness; being often taken more peculiarly for those states which are conceived as belonging to the sensitive, or to the emotional, phasis of our nature, and sometimes, with a still narrower restriction, to the emotional alone, as distinguished from what are conceived as belonging to the percipient or to the intellectual phasis. But this is an admitted departure from correctness of language; just as, by a popular perversion the exact converse of this, the word Mind is withdrawn from its rightful generality of signification, and restricted to the intellect. The still greater perversion by which Feeling is sometimes confined not only to bodily sensations, but to the sensations of a single sense, that of touch, needs not be more particularly adverted to.

Feeling, in the proper sense of the term, is a genus, of which Sensation, Emotion, and Thought, are subordinate species. Under the word Thought is here to be included whatever we are internally conscious of when we are said to think; from the consciousness we have when we think of a red color without having it before our eyes, to the most recondite thoughts of a philosopher or poet. Be it remembered, however, that by a thought is to be understood what passes in the mind itself, and not any object external to the mind, which the person is commonly said to be thinking of. He may be thinking of the sun, or of God, but the sun and God are not thoughts; his mental image, however, of the sun, and his idea of God, are thoughts; states of his mind, not of the objects themselves; and so also is his belief of the existence of the sun, or of God; or his disbelief, if the case be so. Even imaginary objects (which are said to exist only in our ideas) are to be distinguished from our ideas of them. I may think of a hobgoblin, as I may think of the loaf which was eaten yesterday, or of the flower which will bloom to-morrow. But the hobgoblin which never existed is not the same thing with my idea of a hobgoblin, any more than the loaf which once existed is the same thing with my idea of a

loaf, or the flower which does not yet exist, but which will exist, is the same with my idea of a flower. They are all, not thoughts, but objects of thought; though at the present time all the objects are alike non-existent.

In like manner, a Sensation is to be carefully distinguished from the object which causes the sensation; our sensation of white from a white object: nor is it less to be distinguished from the attribute whiteness, which we ascribe to the object in consequence of its exciting the sensation. Unfortunately for clearness and due discrimination in considering these subjects, our sensations seldom receive separate names. We have a name for the objects which produce in us a certain sensation: the word _white_. We have a name for the quality in those objects, to which we ascribe the sensation: the name _whiteness_. But when we speak of the sensation itself (as we have not occasion to do this often except in our scientific speculations), language, which adapts itself for the most part only to the common uses of life, has provided us with no single-worded or immediate designation; we must employ a circumlocution, and say, The sensation of white, or The sensation of whiteness; we must denominate the sensation either from the object, or from the attribute, by which it is excited. Yet the sensation, though it never _does_, might very well be _conceived_ to exist, without any thing whatever to excite it. We can conceive it as arising spontaneously in the mind. But if it so arose, we should have no name to denote it which would not be a misnomer. In the case of our sensations of hearing we are better provided; we have the word Sound, and a whole vocabulary of words to denote the various kinds of sounds. For as we are often conscious of these sensations in the absence of any perceptible object, we can more easily conceive having them in the absence of any object whatever. We need only shut our eyes and listen to music, to have a conception of a universe with nothing in it except sounds, and ourselves hearing them: and what is easily conceived separately, easily obtains a separate name. But in general our names of sensations denote indiscriminately the sensation and the attribute. Thus, _color_ stands for the sensations of white, red, etc., but also for the quality in the colored object. We talk of the colors of things as among their _properties_.

§ 4. In the case of sensations, another distinction has also to be kept in view, which is often confounded, and never without mischievous consequences. This is, the distinction between the sensation itself, and the state of the bodily organs which precedes the sensation, and which constitutes the physical agency by which it is produced. One of the sources of confusion on this subject is the division commonly made of feelings into Bodily and Mental. Philosophically speaking, there is no foundation at all for this distinction: even sensations are states of the sentient mind, not states of the body, as distinguished from it. What I am conscious of when I see the color blue, is a feeling of blue color, which is one thing; the picture on my retina, or the phenomenon of hitherto mysterious nature which takes place in my optic nerve or in my brain, is another thing, of which I am not at all conscious, and which scientific investigation alone could have apprised me of. These are states of my body; but the sensation of blue, which is the consequence of these states of body, is not a state of body: that which perceives and is conscious is called Mind. When sensations are called bodily feelings, it is only as being the class of feelings which are immediately occasioned by bodily states; whereas the other kinds of feelings, thoughts, for instance, or emotions, are immediately excited not by any thing acting upon the bodily organs, but by sensations, or by previous thoughts. This, however, is a distinction not in our feelings, but in the agency which produces our feelings: all of them when actually produced are states of mind.

Besides the affection of our bodily organs from without, and the sensation thereby produced in our minds, many writers admit a third link in the chain of phenomena, which they call a Perception, and which consists in the recognition of an external object as the exciting cause of the sensation. This perception, they say, is an _act_ of the mind, proceeding from its own spontaneous activity; while in a sensation the mind is passive, being merely acted upon by the outward object. And according to some metaphysicians, it is by an act of the mind, similar to perception, except in not being preceded by any sensation, that the existence of God, the soul, and other hyperphysical objects, is recognized.

These acts of what is termed perception, whatever be the conclusion ultimately come to respecting their nature, must, I conceive, take their place among the varieties of feelings or states of mind. In so classing them, I have not the smallest intention of declaring or insinuating any theory as to the law of mind in which these mental processes may be supposed to originate, or the conditions under which they may be legitimate or the reverse. Far less do I mean (as Dr. Whewell seems to suppose must be meant in an analogous case(18)) to indicate that as they are “_merely_ states of mind,” it is superfluous to inquire into their distinguishing peculiarities. I abstain from the inquiry as irrelevant to the science of logic. In these so-called perceptions, or direct recognitions by the mind, of objects, whether physical or spiritual, which are external to itself, I can see only cases of belief; but of belief which claims to be intuitive, or independent of external evidence. When a stone lies before me, I am conscious of certain sensations which I receive from it; but if I say that these sensations come to me from an external object which I _perceive_, the meaning of these words is, that receiving the sensations, I intuitively _believe_ that an external cause of those sensations exists. The laws of intuitive belief, and the conditions under which it is legitimate, are a subject which, as we have already so often remarked, belongs

not to logic, but to the science of the ultimate laws of the human mind.

To the same region of speculation belongs all that can be said respecting the distinction which the German metaphysicians and their French and English followers so elaborately draw between the _acts_ of the mind and its merely passive _states_; between what it receives from, and what it gives to, the crude materials of its experience. I am aware that with reference to the view which those writers take of the primary elements of thought and knowledge, this distinction is fundamental. But for the present purpose, which is to examine, not the original groundwork of our knowledge, but how we come by that portion of it which is not original; the difference between active and passive states of mind is of secondary importance. For us, they all are states of mind, they all are feelings; by which, let it be said once more, I mean to imply nothing of passivity, but simply that they are psychological facts, facts which take place in the mind, and are to be carefully distinguished from the external or physical facts with which they may be connected either as effects or as causes.

§ 5. Among active states of mind, there is, however, one species which merits particular attention, because it forms a principal part of the connotation of some important classes of names. I mean _volitions_, or acts of the will. When we speak of sentient beings by relative names, a large portion of the connotation of the name usually consists of the actions of those beings; actions past, present, and possible or probable future. Take, for instance, the words Sovereign and Subject. What meaning do these words convey, but that of innumerable actions, done or to be done by the sovereign and the subjects, to or in regard to one another reciprocally? So with the words physician and patient, leader and follower, tutor and pupil. In many cases the words also connote actions which would be done under certain contingencies by persons other than those denoted: as the words mortgagor and mortgagee, obligor and obligee, and many other words expressive of legal relation, which connote what a court of justice would do to enforce the legal obligation if not fulfilled. There are also words which connote actions previously done by persons other than those denoted either by the name itself or by its correlative; as the word brother. From these instances, it may be seen how large a portion of the connotation of names consists of actions. Now what is an action? Not one thing, but a series of two things: the state of mind called a volition, followed by an effect. The volition or intention to produce the effect, is one thing; the effect produced in consequence of the intention, is another thing; the two together constitute the action. I form the purpose of instantly moving my arm; that is a state of my mind: my arm (not being tied or paralytic) moves in obedience to my purpose; that is a physical fact, consequent on a state of mind. The intention, followed by the fact, or (if we prefer the expression) the fact when preceded and caused by the intention, is called the action of moving my arm.

§ 6. Of the first leading division of namable things, viz., Feelings or States of Consciousness, we began by recognizing three subdivisions; Sensations, Thoughts, and Emotions. The first two of these we have illustrated at considerable length; the third, Emotions, not being perplexed by similar ambiguities, does not require similar exemplification. And, finally, we have found it necessary to add to these three a fourth species, commonly known by the name Volitions. We shall now proceed to the two remaining classes of namable things; all things which are regarded as external to the mind being considered as belonging either to the class of Substances or to that of Attributes.

II. Substances.

Logicians have endeavored to define Substance and Attribute; but their definitions are not so much attempts to draw a distinction between the things themselves, as instructions what difference it is customary to make in the grammatical structure of the sentence, according as we are speaking of substances or of attributes. Such definitions are rather lessons of English, or of Greek, Latin, or German, than of mental philosophy. An attribute, say the school logicians, must be the attribute _of_ something; color, for example, must be the color _of_ something; goodness must be the goodness _of_ something; and if this something should cease to exist, or should cease to be connected with the attribute, the existence of the attribute would be at an end. A substance, on the contrary, is self-existent; in speaking about it, we need not put _of_ after its name. A stone is not the stone of any thing; the moon is not the moon _of_ any thing, but simply the moon. Unless, indeed, the name which we choose to give to the substance be a relative name; if so, it must be followed either by _of_, or by some other particle, implying, as that preposition does, a reference to something else: but then the other characteristic peculiarity of an attribute would fail; the _something_ might be destroyed, and the substance might still subsist. Thus, a father must be the father _of_ something, and so far resembles an attribute, in being referred to something besides himself: if there were no child, there would be no father: but this, when we look into the matter, only means that we should not call him father. The man called father might still exist though there were no child, as he existed before there was a child; and there would be no contradiction in supposing him to exist, though the whole universe except himself were destroyed. But destroy all white substances, and where would be the attribute whiteness? Whiteness, without any white thing, is a

contradiction in terms.

This is the nearest approach to a solution of the difficulty, that will be found in the common treatises on logic. It will scarcely be thought to be a satisfactory one. If an attribute is distinguished from a substance by being the attribute _of_ something, it seems highly necessary to understand what is meant by _of_; a particle which needs explanation too much itself, to be placed in front of the explanation of any thing else. And as for the self-existence of substance, it is very true that a substance may be conceived to exist without any other substance, but so also may an attribute without any other attribute: and we can no more imagine a substance without attributes than we can imagine attributes without a substance.

Metaphysicians, however, have probed the question deeper, and given an account of Substance considerably more satisfactory than this. Substances are usually distinguished as Bodies or Minds. Of each of these, philosophers have at length provided us with a definition which seems unexceptionable.

§ 7. A body, according to the received doctrine of modern metaphysicians, may be defined, the external cause to which we ascribe our sensations. When I see and touch a piece of gold, I am conscious of a sensation of yellow color, and sensations of hardness and weight; and by varying the mode of handling, I may add to these sensations many others completely distinct from them. The sensations are all of which I am directly conscious; but I consider them as produced by something not only existing independently of my will, but external to my bodily organs and to my mind. This external something I call a body.

It may be asked, how come we to ascribe our sensations to any external cause? And is there sufficient ground for so ascribing them? It is known, that there are metaphysicians who have raised a controversy on the point; maintaining that we are not warranted in referring our sensations to a cause such as we understand by the word Body, or to any external cause whatever. Though we have no concern here with this controversy, nor with the metaphysical niceties on which it turns, one of the best ways of showing what is meant by Substance is, to consider what position it is necessary to take up, in order to maintain its existence against opponents.

It is certain, then, that a part of our notion of a body consists of the notion of a number of sensations of our own, or of other sentient beings, habitually occurring simultaneously. My conception of the table at which I am writing is compounded of its visible form and size, which are complex sensations of sight; its tangible form and size, which are complex sensations of our organs of touch and of our muscles; its weight, which is also a sensation of touch and of the muscles; its color, which is a sensation of sight; its hardness, which is a sensation of the muscles; its composition, which is another word for all the varieties of sensation which we receive under various circumstances from the wood of which it is made, and so forth. All or most of these various sensations frequently are, and, as we learn by experience, always might be, experienced simultaneously, or in many different orders of succession at our own choice: and hence the thought of any one of them makes us think of the others, and the whole becomes mentally amalgamated into one mixed state of consciousness, which, in the language of the school of Locke and Hartley, is termed a Complex Idea.

Now, there are philosophers who have argued as follows: If we conceive an orange to be divested of its natural color without acquiring any new one; to lose its softness without becoming hard, its roundness without becoming square or pentagonal, or of any other regular or irregular figure whatever; to be deprived of size, of weight, of taste, of smell; to lose all its mechanical and all its chemical properties, and acquire no new ones; to become, in short, invisible, intangible, imperceptible not only by all our senses, but by the senses of all other sentient beings, real or possible; nothing, say these thinkers, would remain. For of what nature, they ask, could be the residuum? and by what token could it manifest its presence? To the unreflecting its existence seems to rest on the evidence of the senses. But to the senses nothing is apparent except the sensations. We know, indeed, that these sensations are bound together by some law; they do not come together at random, but according to a systematic order, which is part of the order established in the universe. When we experience one of these sensations, we usually experience the others also, or know that we have it in our power to experience them. But a fixed law of connection, making the sensations occur together, does not, say these philosophers, necessarily require what is called a substratum to support them. The conception of a substratum is but one of many possible forms in which that connection presents itself to our imagination; a mode of, as it were, realizing the idea. If there be such a substratum, suppose it at this instant miraculously annihilated, and let the sensations continue to occur in the same order, and how would the substratum be missed? By what signs should we be able to discover that its existence had terminated? Should we not have as much reason to believe that it still existed as we now have? And if we should not then be warranted in believing it, how can we be so now? A body, therefore, according to these metaphysicians, is not any thing intrinsically different from the sensations which the body is said to produce in us; it is, in short, a set of sensations, or rather, of possibilities of sensation, joined together according to a fixed law.

The controversies to which these speculations have given rise, and the doctrines which have been developed in the attempt to find a conclusive answer to them, have been fruitful of important consequences to the Science of Mind. The sensations (it was answered) which we are conscious of, and which we receive, not at random, but joined together in a certain uniform manner, imply not only a law or laws of connection, but a cause external to our mind, which cause, by its own laws, determines the laws according to which the sensations are connected and experienced. The schoolmen used to call this external cause by the name we have already employed, a _substratum_; and its attributes (as they expressed themselves) _inhered_, literally _stuck_, in it. To this substratum the name Matter is usually given in philosophical discussions. It was soon, however, acknowledged by all who reflected on the subject, that the existence of matter can not be proved by extrinsic evidence. The answer, therefore, now usually made to Berkeley and his followers, is, that the belief is intuitive; that mankind, in all ages, have felt themselves compelled, by a necessity of their nature, to refer their sensations to an external cause: that even those who deny it in theory, yield to the necessity in practice, and both in speech, thought, and feeling, do, equally with the vulgar, acknowledge their sensations to be the effects of something external to them: this knowledge, therefore, it is affirmed, is as evidently intuitive as our knowledge of our sensations themselves is intuitive. And here the question merges in the fundamental problem of metaphysics properly so called: to which science we leave it.

But although the extreme doctrine of the Idealist metaphysicians, that objects are nothing but our sensations and the laws which connect them, has not been generally adopted by subsequent thinkers; the point of most real importance is one on which those metaphysicians are now very generally considered to have made out their case: viz., that _all we know_ of objects is the sensations which they give us, and the order of the occurrence of those sensations. Kant himself, on this point, is as explicit as Berkeley or Locke. However firmly convinced that there exists a universe of “Things in themselves,” totally distinct from the universe of phenomena, or of things as they appear to our senses; and even when bringing into use a technical expression (_Noumenon_) to denote what the thing is in itself, as contrasted with the _representation_ of it in our minds; he allows that this representation (the matter of which, he says, consists of our sensations, though the form is given by the laws of the mind itself) is all we know of the object: and that the real nature of the Thing is, and by the constitution of our faculties ever must remain, at least in the present state of existence, an impenetrable mystery to us. “Of things absolutely or in themselves,” says Sir William Hamilton,(19) “be they external, be they internal, we know nothing, or know them only as incognizable; and become aware of their incomprehensible existence, only as this is indirectly and accidentally revealed to us, through certain qualities related to our faculties of knowledge, and which qualities, again, we can not think as unconditional, irrelative, existent in and of ourselves. All that we know is therefore phenomenal—phenomenal of the unknown.”(20) The same doctrine is laid down in the clearest and strongest terms by M. Cousin, whose observations on the subject are the more worthy of attention, as, in consequence of the ultra-German and ontological character of his philosophy in other respects, they may be regarded as the admissions of an opponent.(21)

There is not the slightest reason for believing that what we call the sensible qualities of the object are a type of any thing inherent in itself, or bear any affinity to its own nature. A cause does not, as such, resemble its effects; an east wind is not like the feeling of cold, nor heat like the steam of boiling water. Why then should matter resemble our sensations? Why should the inmost nature of fire or water resemble the impressions made by those objects upon our senses?(22) Or on what principle are we authorized to deduce from the effects, any thing concerning the cause, except that it is a cause adequate to produce those effects? It may, therefore, safely be laid down as a truth both obvious in itself, and admitted by all whom it is at present necessary to take into consideration, that, of the outward world, we know and can know absolutely nothing, except the sensations which we experience from it.(23)

§ 8. Body having now been defined the external cause, and (according to the more reasonable opinion) the unknown external cause, to which we refer our sensations; it remains to frame a definition of Mind. Nor, after the preceding observations, will this be difficult. For, as our conception of a body is that of an unknown exciting cause of sensations, so our conception of a mind is that of an unknown recipient or percipient, of them; and not of them alone, but of all our other feelings. As body is understood to be the mysterious something which excites the mind to feel, so mind is the mysterious something which feels and thinks. It is unnecessary to give in the case of mind, as we gave in the case of matter, a particular statement of the skeptical system by which its existence as a Thing in itself, distinct from the series of what are denominated its states, is called in question. But it is necessary to remark, that on the inmost nature (whatever be meant by inmost nature) of the thinking principle, as well as on the inmost nature of matter, we are, and with our faculties must always remain, entirely in the dark. All which we are aware of, even in our own minds, is (in the words of James Mill) a certain “thread of consciousness;” a series of feelings, that is, of sensations, thoughts, emotions, and volitions, more or less numerous and complicated. There is a something I call Myself, or, by another form of expression, my mind, which I consider as distinct from these sensations, thoughts, etc.; a something which I conceive to be not the thoughts, but the

being that has the thoughts, and which I can conceive as existing forever in a state of quiescence, without any thoughts at all. But what this being is, though it is myself, I have no knowledge, other than the series of its states of consciousness. As bodies manifest themselves to me only through the sensations of which I regard them as the causes, so the thinking principle, or mind, in my own nature, makes itself known to me only by the feelings of which it is conscious. I know nothing about myself, save my capacities of feeling or being conscious (including, of course, thinking and willing): and were I to learn any thing new concerning my own nature, I can not with my present faculties conceive this new information to be any thing else, than that I have some additional capacities, as yet unknown to me, of feeling, thinking, or willing.

Thus, then, as body is the unsentient cause to which we are naturally prompted to refer a certain portion of our feelings, so mind may be described as the sentient _subject_ (in the scholastic sense of the term) of all feelings; that which has or feels them. But of the nature of either body or mind, further than the feelings which the former excites, and which the latter experiences, we do not, according to the best existing doctrine, know any thing; and if any thing, logic has nothing to do with it, or with the manner in which the knowledge is acquired. With this result we may conclude this portion of our subject, and pass to the third and only remaining class or division of Namable Things.

III. Attributes: and, first, Qualities.

§ 9. From what has already been said of Substance, what is to be said of Attribute is easily deducible. For if we know not, and can not know, any thing of bodies but the sensations which they excite in us or in others, those sensations must be all that we can, at bottom, mean by their attributes; and the distinction which we verbally make between the properties of things and the sensations we receive from them, must originate in the convenience of discourse rather than in the nature of what is signified by the terms.

Attributes are usually distributed under the three heads of Quality, Quantity, and Relation. We shall come to the two latter presently: in the first place we shall confine ourselves to the former.

Let us take, then, as our example, one of what are termed the sensible qualities of objects, and let that example be whiteness. When we ascribe whiteness to any substance, as, for instance, snow; when we say that snow has the quality whiteness, what do we really assert? Simply, that when snow is present to our organs, we have a particular sensation, which we are accustomed to call the sensation of white. But how do I know that snow is present? Obviously by the sensations which I derive from it, and not otherwise. I infer that the object is present, because it gives me a certain assemblage or series of sensations. And when I ascribe to it the attribute whiteness, my meaning is only, that, of the sensations composing this group or series, that which I call the sensation of white color is one.

This is one view which may be taken of the subject. But there is also another and a different view. It may be said, that it is true we _know_ nothing of sensible objects, except the sensations they excite in us; that the fact of our receiving from snow the particular sensation which is called a sensation of white, is the _ground_ on which we ascribe to that substance the quality whiteness; the sole proof of its possessing that quality. But because one thing may be the sole evidence of the existence of another thing, it does not follow that the two are one and the same. The attribute whiteness (it may be said) is not the fact of receiving the sensation, but something in the object itself; a _power_ inherent in it; something _in virtue_ of which the object produces the sensation. And when we affirm that snow possesses the attribute whiteness, we do not merely assert that the presence of snow produces in us that sensation, but that it does so through, and by reason of, that power or quality.

For the purposes of logic it is not of material importance which of these opinions we adopt. The full discussion of the subject belongs to the other department of scientific inquiry, so often alluded to under the name of metaphysics; but it may be said here, that for the doctrine of the existence of a peculiar species of entities called qualities, I can see no foundation except in a tendency of the human mind which is the cause of many delusions. I mean, the disposition, wherever we meet with two names which are not precisely synonymous, to suppose that they must be the names of two different things; whereas in reality they may be names of the same thing viewed in two different lights, or under different suppositions as to surrounding circumstances. Because _quality_ and _sensation_ can not be put indiscriminately one for the other, it is supposed that they can not both signify the same thing, namely, the impression or feeling with which we are affected through our senses by the presence of an object; though there is at least no absurdity in supposing that this identical impression or feeling may be called a sensation when considered merely in itself, and a quality when looked at in relation to any one of the numerous objects, the presence of which to our organs excites in our minds that among various other sensations or feelings. And if this be admissible as a supposition, it rests with those who contend for an entity _per se_ called a quality, to show that their opinion is preferable, or is any thing in fact but a lingering remnant of the old doctrine of

occult causes; the very absurdity which Molière so happily ridiculed when he made one of his pedantic physicians account for the fact that opium produces sleep by the maxim, Because it has a soporific virtue.

It is evident that when the physician stated that opium has a soporific virtue, he did not account for, but merely asserted over again, the fact that it produces sleep. In like manner, when we say that snow is white because it has the quality of whiteness, we are only re-asserting in more technical language the fact that it excites in us the sensation of white. If it be said that the sensation must have some cause, I answer, its cause is the presence of the assemblage of phenomena which is termed the object. When we have asserted that as often as the object is present, and our organs in their normal state, the sensation takes place, we have stated all that we know about the matter. There is no need, after assigning a certain and intelligible cause, to suppose an occult cause besides, for the purpose of enabling the real cause to produce its effect. If I am asked, why does the presence of the object cause this sensation in me, I can not tell: I can only say that such is my nature, and the nature of the object; that the fact forms a part of the constitution of things. And to this we must at last come, even after interpolating the imaginary entity. Whatever number of links the chain of causes and effects may consist of, how any one link produces the one which is next to it, remains equally inexplicable to us. It is as easy to comprehend that the object should produce the sensation directly and at once, as that it should produce the same sensation by the aid of something else called the _power_ of producing it.

But, as the difficulties which may be felt in adopting this view of the subject can not be removed without discussions transcending the bounds of our science, I content myself with a passing indication, and shall, for the purposes of logic, adopt a language compatible with either view of the nature of qualities. I shall say—what at least admits of no dispute—that the quality of whiteness ascribed to the object snow, is _grounded_ on its exciting in us the sensation of white; and adopting the language already used by the school logicians in the case of the kind of attributes called Relations, I shall term the sensation of white the _foundation_ of the quality whiteness. For logical purposes the sensation is the only essential part of what is meant by the word; the only part which we ever can be concerned in proving. When that is proved, the quality is proved; if an object excites a sensation, it has, of course, the power of exciting it.

IV. Relations.

§ 10. The _qualities_ of a body, we have said, are the attributes grounded on the sensations which the presence of that particular body to our organs excites in our minds. But when we ascribe to any object the kind of attribute called a Relation, the foundation of the attribute must be something in which other objects are concerned besides itself and the percipient.

As there may with propriety be said to be a relation between any two things to which two correlative names are or may be given, we may expect to discover what constitutes a relation in general, if we enumerate the principal cases in which mankind have imposed correlative names, and observe what these cases have in common.

What, then, is the character which is possessed in common by states of circumstances so heterogeneous and discordant as these: one thing _like_ another; one thing _unlike_ another; one thing _near_ another; one thing _far from_ another; one thing _before_, _after_, _along with_ another; one thing _greater_, _equal_, _less_, than another; one thing the _cause_ of another, the _effect_ of another; one person the _master_, _servant_, _child_, _parent_, _debtor_, _creditor_, _sovereign_, _subject_, _attorney_, _client_, of another, and so on?

Omitting, for the present, the case of Resemblance, (a relation which requires to be considered separately,) there seems to be one thing common to all these cases, and only one; that in each of them there exists or occurs, or has existed or occurred, or may be expected to exist or occur, some fact or phenomenon, into which the two things which are said to be related to each other, both enter as parties concerned. This fact, or phenomenon, is what the Aristotelian logicians called the _fundamentum relationis_. Thus in the relation of greater and less between two magnitudes, the _fundamentum relationis_ is the fact that one of the two magnitudes could, under certain conditions, be included in, without entirely filling, the space occupied by the other magnitude. In the relation of master and servant, the _fundamentum relationis_ is the fact that the one has undertaken, or is compelled, to perform certain services for the benefit and at the bidding of the other. Examples might be indefinitely multiplied; but it is already obvious that whenever two things are said to be related, there is some fact, or series of facts, into which they both enter; and that whenever any two things are involved in some one fact, or series of facts, we may ascribe to those two things a mutual relation grounded on the fact. Even if they have nothing in common but what is common to all things, that they are members of the universe, we call that a relation, and denominate them fellow-creatures, fellow-beings, or fellow-denizens of the universe. But in proportion as the fact into which the two objects enter as parts is of a more special and peculiar, or of a more complicated nature, so also is the relation

grounded upon it. And there are as many conceivable relations as there are conceivable kinds of fact in which two things can be jointly concerned.

In the same manner, therefore, as a quality is an attribute grounded on the fact that a certain sensation or sensations are produced in us by the object, so an attribute grounded on some fact into which the object enters jointly with another object, is a relation between it and that other object. But the fact in the latter case consists of the very same kind of elements as the fact in the former; namely, states of consciousness. In the case, for example, of any legal relation, as debtor and creditor, principal and agent, guardian and ward, the _fundamentum relationis_ consists entirely of thoughts, feelings, and volitions (actual or contingent), either of the persons themselves or of other persons concerned in the same series of transactions; as, for instance, the intentions which would be formed by a judge, in case a complaint were made to his tribunal of the infringement of any of the legal obligations imposed by the relation; and the acts which the judge would perform in consequence; acts being (as we have already seen) another word for intentions followed by an effect, and that effect being but another word for sensations, or some other feelings, occasioned either to the agent himself or to somebody else. There is no part of what the names expressive of the relation imply, that is not resolvable into states of consciousness; outward objects being, no doubt, supposed throughout as the causes by which some of those states of consciousness are excited, and minds as the subjects by which all of them are experienced, but neither the external objects nor the minds making their existence known otherwise than by the states of consciousness.

Cases of relation are not always so complicated as those to which we last alluded. The simplest of all cases of relation are those expressed by the words antecedent and consequent, and by the word simultaneous. If we say, for instance, that dawn preceded sunrise, the fact in which the two things, dawn and sunrise, were jointly concerned, consisted only of the two things themselves; no third thing entered into the fact or phenomenon at all. Unless, indeed, we choose to call the succession of the two objects a third thing; but their succession is not something added to the things themselves; it is something involved in them. Dawn and sunrise announce themselves to our consciousness by two successive sensations. Our consciousness of the succession of these sensations is not a third sensation or feeling added to them; we have not first the two feelings, and then a feeling of their succession. To have two feelings at all, implies having them either successively, or else simultaneously. Sensations, or other feelings, being given, succession and simultaneousness are the two conditions, to the alternative of which they are subjected by the nature of our faculties; and no one has been able, or needs expect, to analyze the matter any further.

§ 11. In a somewhat similar position are two other sorts of relations, Likeness and Unlikeness. I have two sensations; we will suppose them to be simple ones; two sensations of white, or one sensation of white and another of black. I call the first two sensations _like_; the last two _unlike_. What is the fact or phenomenon constituting the _fundamentum_ of this relation? The two sensations first, and then what we call a feeling of resemblance, or of want of resemblance. Let us confine ourselves to the former case. Resemblance is evidently a feeling; a state of the consciousness of the observer. Whether the feeling of the resemblance of the two colors be a third state of consciousness, which I have _after_ having the two sensations of color, or whether (like the feeling of their succession) it is involved in the sensations themselves, may be a matter of discussion. But in either case, these feelings of resemblance, and of its opposite dissimilarity, are parts of our nature; and parts so far from being capable of analysis, that they are presupposed in every attempt to analyze any of our other feelings. Likeness and unlikeness, therefore, as well as antecedence, sequence, and simultaneousness, must stand apart among relations, as things _sui generis_. They are attributes grounded on facts, that is, on states of consciousness, but on states which are peculiar, unresolvable, and inexplicable.

But, though likeness or unlikeness can not be resolved into any thing else, complex cases of likeness or unlikeness can be resolved into simpler ones. When we say of two things which consist of parts, that they are like one another, the likeness of the wholes does admit of analysis; it is compounded of likenesses between the various parts respectively, and of likeness in their arrangement. Of how vast a variety of resemblances of parts must that resemblance be composed, which induces us to say that a portrait, or a landscape, is like its original. If one person mimics another with any success, of how many simple likenesses must the general or complex likeness be compounded: likeness in a succession of bodily postures; likeness in voice, or in the accents and intonations of the voice; likeness in the choice of words, and in the thoughts or sentiments expressed, whether by word, countenance, or gesture.

All likeness and unlikeness of which we have any cognizance, resolve themselves into likeness and unlikeness between states of our own, or some other, mind. When we say that one body is like another, (since we know nothing of bodies but the sensations which they excite,) we mean really that there is a resemblance between the sensations excited by the two bodies, or between some portions at least of those sensations. If we say that two attributes are like one another (since we know nothing of attributes except the sensations or states of feeling on which they are grounded), we mean really that those sensations, or states of feeling,

resemble each other. We may also say that two relations are alike. The fact of resemblance between relations is sometimes called _analogy_, forming one of the numerous meanings of that word. The relation in which Priam stood to Hector, namely, that of father and son, resembles the relation in which Philip stood to Alexander; resembles it so closely that they are called the same relation. The relation in which Cromwell stood to England resembles the relation in which Napoleon stood to France, though not so closely as to be called the same relation. The meaning in both these instances must be, that a resemblance existed between the facts which constituted the _fundamentum relationis_.

This resemblance may exist in all conceivable gradations, from perfect undistinguishableness to something extremely slight. When we say, that a thought suggested to the mind of a person of genius is like a seed cast into the ground, because the former produces a multitude of other thoughts, and the latter a multitude of other seeds, this is saying that between the relation of an inventive mind to a thought contained in it, and the relation of a fertile soil to a seed contained in it, there exists a resemblance: the real resemblance being in the two _fundamenta relationis_, in each of which there occurs a germ, producing by its development a multitude of other things similar to itself. And as, whenever two objects are jointly concerned in a phenomenon, this constitutes a relation between those objects, so, if we suppose a second pair of objects concerned in a second phenomenon, the slightest resemblance between the two phenomena is sufficient to admit of its being said that the two relations resemble; provided, of course, the points of resemblance are found in those portions of the two phenomena respectively which are connoted by the relative names.

While speaking of resemblance, it is necessary to take notice of an ambiguity of language, against which scarcely any one is sufficiently on his guard. Resemblance, when it exists in the highest degree of all, amounting to undistinguishableness, is often called identity, and the two similar things are said to be the same. I say often, not always; for we do not say that two visible objects, two persons, for instance, are the same, because they are so much alike that one might be mistaken for the other: but we constantly use this mode of expression when speaking of feelings; as when I say that the sight of any object gives me the _same_ sensation or emotion to-day that it did yesterday, or the _same_ which it gives to some other person. This is evidently an incorrect application of the word _same_; for the feeling which I had yesterday is gone, never to return; what I have to-day is another feeling, exactly like the former, perhaps, but distinct from it; and it is evident that two different persons can not be experiencing the same feeling, in the sense in which we say that they are both sitting at the same table. By a similar ambiguity we say, that two persons are ill of the _same_ disease; that two persons hold the _same_ office; not in the sense in which we say that they are engaged in the same adventure, or sailing in the same ship, but in the sense that they fill offices exactly similar, though, perhaps, in distant places. Great confusion of ideas is often produced, and many fallacies engendered, in otherwise enlightened understandings, by not being sufficiently alive to the fact (in itself not always to be avoided), that they use the same name to express ideas so different as those of identity and undistinguishable resemblance. Among modern writers, Archbishop Whately stands almost alone in having drawn attention to this distinction, and to the ambiguity connected with it.

Several relations, generally called by other names, are really cases of resemblance. As, for example, equality; which is but another word for the exact resemblance commonly called identity, considered as subsisting between things in respect of their _quantity_. And this example forms a suitable transition to the third and last of the three heads under which, as already remarked, Attributes are commonly arranged.

V. Quantity.

§ 12. Let us imagine two things, between which there is no difference (that is, no dissimilarity), except in quantity alone; for instance, a gallon of water, and more than a gallon of water. A gallon of water, like any other external object, makes its presence known to us by a set of sensations which it excites. Ten gallons of water are also an external object, making its presence known to us in a similar manner; and as we do not mistake ten gallons of water for a gallon of water, it is plain that the set of sensations is more or less different in the two cases. In like manner, a gallon of water, and a gallon of wine, are two external objects, making their presence known by two sets of sensations, which sensations are different from each other. In the first case, however, we say that the difference is in quantity; in the last there is a difference in quality, while the quantity of the water and of the wine is the same. What is the real distinction between the two cases? It is not within the province of Logic to analyze it; nor to decide whether it is susceptible of analysis or not. For us the following considerations are sufficient: It is evident that the sensations I receive from the gallon of water, and those I receive from the gallon of wine, are not the same, that is, not precisely alike; neither are they altogether unlike: they are partly similar, partly dissimilar; and that in which they resemble is precisely that in which alone the gallon of water and the ten gallons do not resemble. That in which the gallon of water and the gallon of wine are like each other, and in which the

gallon and the ten gallons of water are unlike each other, is called their quantity. This likeness and unlikeness I do not pretend to explain, no more than any other kind of likeness or unlikeness. But my object is to show, that when we say of two things that they differ in quantity, just as when we say that they differ in quality, the assertion is always grounded on a difference in the sensations which they excite. Nobody, I presume, will say, that to see, or to lift, or to drink, ten gallons of water, does not include in itself a different set of sensations from those of seeing, lifting, or drinking one gallon; or that to see or handle a foot-rule, and to see or handle a yard-measure made exactly like it, are the same sensations. I do not undertake to say what the difference in the sensations is. Every body knows, and nobody can tell; no more than any one could tell what white is to a person who had never had the sensation. But the difference, so far as cognizable by our faculties, lies in the sensations. Whatever difference we say there is in the things themselves, is, in this as in all other cases, grounded, and grounded exclusively, on a difference in the sensations excited by them.

VI. Attributes Concluded.

§ 13. Thus, then, all the attributes of bodies which are classed under Quality or Quantity, are grounded on the sensations which we receive from those bodies, and may be defined, the powers which the bodies have of exciting those sensations. And the same general explanation has been found to apply to most of the attributes usually classed under the head of Relation. They, too, are grounded on some fact or phenomenon into which the related objects enter as parts; that fact or phenomenon having no meaning and no existence to us, except the series of sensations or other states of consciousness by which it makes itself known; and the relation being simply the power or capacity which the object possesses of taking part along with the correlated object in the production of that series of sensations or states of consciousness. We have been obliged, indeed, to recognize a somewhat different character in certain peculiar relations, those of succession and simultaneity, of likeness and unlikeness. These, not being grounded on any fact or phenomenon distinct from the related objects themselves, do not admit of the same kind of analysis. But these relations, though not, like other relations, grounded on states of consciousness, are themselves states of consciousness: resemblance is nothing but our feeling of resemblance; succession is nothing but our feeling of succession. Or, if this be disputed (and we can not, without transgressing the bounds of our science, discuss it here), at least our knowledge of these relations, and even our possibility of knowledge, is confined to those which subsist between sensations, or other states of consciousness; for, though we ascribe resemblance, or succession, or simultaneity, to objects and to attributes, it is always in virtue of resemblance or succession or simultaneity in the sensations or states of consciousness which those objects excite, and on which those attributes are grounded.

§ 14. In the preceding investigation we have, for the sake of simplicity, considered bodies only, and omitted minds. But what we have said, is applicable, _mutatis mutandis_, to the latter. The attributes of minds, as well as those of bodies, are grounded on states of feeling or consciousness. But in the case of a mind, we have to consider its own states, as well as those which it produces in other minds. Every attribute of a mind consists either in being itself affected in a certain way, or affecting other minds in a certain way. Considered in itself, we can predicate nothing of it but the series of its own feelings. When we say of any mind, that it is devout, or superstitious, or meditative, or cheerful, we mean that the ideas, emotions, or volitions implied in those words, form a frequently recurring part of the series of feelings, or states of consciousness, which fill up the sentient existence of that mind.

In addition, however, to those attributes of a mind which are grounded on its own states of feeling, attributes may also be ascribed to it, in the same manner as to a body, grounded on the feelings which it excites in other minds. A mind does not, indeed, like a body, excite sensations, but it may excite thoughts or emotions. The most important example of attributes ascribed on this ground, is the employment of terms expressive of approbation or blame. When, for example, we say of any character, or (in other words) of any mind, that it is admirable, we mean that the contemplation of it excites the sentiment of admiration; and indeed somewhat more, for the word implies that we not only feel admiration, but approve that sentiment in ourselves. In some cases, under the semblance of a single attribute, two are really predicated: one of them, a state of the mind itself; the other, a state with which other minds are affected by thinking of it. As when we say of any one that he is generous. The word generosity expresses a certain state of mind, but being a term of praise, it also expresses that this state of mind excites in us another mental state, called approbation. The assertion made, therefore, is twofold, and of the following purport: Certain feelings form habitually a part of this person's sentient existence; and the idea of those feelings of his, excites the sentiment of approbation in ourselves or others.

As we thus ascribe attributes to minds on the ground of ideas and emotions, so may we to bodies on similar grounds, and not solely on the ground of sensations: as in speaking of the beauty of a statue; since this attribute is grounded on the peculiar feeling of pleasure which the statue produces in our minds; which is not a sensation, but an emotion.

VII. General Results.

§ 15. Our survey of the varieties of Things which have been, or which are capable of being, named—which have been, or are capable of being, either predicated of other Things, or themselves made the subject of predications—is now concluded.

Our enumeration commenced with Feelings. These we scrupulously distinguished from the objects which excite them, and from the organs by which they are, or may be supposed to be, conveyed. Feelings are of four sorts: Sensations, Thoughts, Emotions, and Volitions. What are called Perceptions are merely a particular case of Belief, and Belief is a kind of thought. Actions are merely volitions followed by an effect.

After Feelings we proceeded to Substances. These are either Bodies or Minds. Without entering into the grounds of the metaphysical doubts which have been raised concerning the existence of Matter and Mind as objective realities, we stated as sufficient for us the conclusion in which the best thinkers are now for the most part agreed, that all we can know of Matter is the sensations which it gives us, and the order of occurrence of those sensations; and that while the substance Body is the unknown cause of our sensations, the substance Mind is the unknown recipient.

The only remaining class of Namable Things is Attributes; and these are of three kinds, Quality, Relation, and Quantity. Qualities, like substances, are known to us no otherwise than by the sensations or other states of consciousness which they excite: and while, in compliance with common usage, we have continued to speak of them as a distinct class of Things, we showed that in predicating them no one means to predicate any thing but those sensations or states of consciousness, on which they may be said to be grounded, and by which alone they can be defined or described. Relations, except the simple cases of likeness and unlikeness, succession and simultaneity, are similarly grounded on some fact or phenomenon, that is, on some series of sensations or states of consciousness, more or less complicated. The third species of Attribute, Quantity, is also manifestly grounded on something in our sensations or states of feeling, since there is an indubitable difference in the sensations excited by a larger and a smaller bulk, or by a greater or a less degree of intensity, in any object of sense or of consciousness. All attributes, therefore, are to us nothing but either our sensations and other states of feeling, or something inextricably involved therein; and to this even the peculiar and simple relations just adverted to are not exceptions. Those peculiar relations, however, are so important, and, even if they might in strictness be classed among states of consciousness, are so fundamentally distinct from any other of those states, that it would be a vain subtlety to bring them under that common description, and it is necessary that they should be classed apart.(24)

As the result, therefore, of our analysis, we obtain the following as an enumeration and classification of all Namable Things:

1st. Feelings, or States of Consciousness.

2d. The Minds which experience those feelings.

3d. The Bodies, or external objects which excite certain of those feelings, together with the powers or properties whereby they excite them; these latter (at least) being included rather in compliance with common opinion, and because their existence is taken for granted in the common language from which I can not prudently deviate, than because the recognition of such powers or properties as real existences appears to be warranted by a sound philosophy.

4th, and last. The Successions and Co-existences, the Likenesses and Unlikenesses, between feelings or states of consciousness. Those relations, when considered as subsisting between other things, exist in reality only between the states of consciousness which those things, if bodies, excite, if minds, either excite or experience.

This, until a better can be suggested, may serve as a substitute for the Categories of Aristotle considered as a classification of Existences. The practical application of it will appear when we commence the inquiry into the Import of Propositions; in other words, when we inquire what it is which the mind actually believes, when it gives what is called its assent to a proposition.

These four classes comprising, if the classification be correct, all Namable Things, these or some of them must of course compose the signification of all names: and of these, or some of them, is made up whatever we call a fact.

For distinction's sake, every fact which is solely composed of feelings or states of consciousness considered as such, is often called a Psychological or Subjective fact; while every fact which is composed, either wholly or in part, of something different from these, that is, of substances and attributes, is called an Objective fact. We may say, then, that every objective fact is grounded on a

corresponding subjective one; and has no meaning to us (apart from the subjective fact which corresponds to it), except as a name for the unknown and inscrutable process by which that subjective or psychological fact is brought to pass.

Chapter IV.

Of Propositions.

§ 1. In treating of Propositions, as already in treating of Names, some considerations of a comparatively elementary nature respecting their form and varieties must be premised, before entering upon that analysis of the import conveyed by them, which is the real subject and purpose of this preliminary book.

A proposition, we have before said, is a portion of discourse in which a predicate is affirmed or denied of a subject. A predicate and a subject are all that is necessarily required to make up a proposition: but as we can not conclude from merely seeing two names put together, that they are a predicate and a subject, that is, that one of them is intended to be affirmed or denied of the other, it is necessary that there should be some mode or form of indicating that such is the intention; some sign to distinguish a predication from any other kind of discourse. This is sometimes done by a slight alteration of one of the words, called an _inflection_; as when we say, Fire burns; the change of the second word from _burn_ to _burns_ showing that we mean to affirm the predicate burn of the subject fire. But this function is more commonly fulfilled by the word _is_, when an affirmation is intended, _is not_, when a negation; or by some other part of the verb _to be_. The word which thus serves the purpose of a sign of predication is called, as we formerly observed, the _copula_. It is important that there should be no indistinctness in our conception of the nature and office of the copula; for confused notions respecting it are among the causes which have spread mysticism over the field of logic, and perverted its speculations into logomachies.

It is apt to be supposed that the copula is something more than a mere sign of predication; that it also signifies existence. In the proposition, Socrates is just, it may seem to be implied not only that the quality _just_ can be affirmed of Socrates, but moreover that Socrates _is_, that is to say, exists. This, however, only shows that there is an ambiguity in the word _is_; a word which not only performs the function of the copula in affirmations, but has also a meaning of its own, in virtue of which it may itself be made the predicate of a proposition. That the employment of it as a copula does not necessarily include the affirmation of existence, appears from such a proposition as this, A centaur is a fiction of the poets; where it can not possibly be implied that a centaur exists, since the proposition itself expressly asserts that the thing has no real existence.

Many volumes might be filled with the frivolous speculations concerning the nature of Being (το ■ν, ο■σ■α, Ens, Entitas, Essentia, and the like), which have arisen from overlooking this double meaning of the word _to be_; from supposing that when it signifies _to exist_, and when it signifies to _be_ some specified thing, as to _be_ a man, to _be_ Socrates, to _be_ seen or spoken of, to _be_ a phantom, even to _be_ a nonentity, it must still, at bottom, answer to the same idea; and that a meaning must be found for it which shall suit all these cases. The fog which rose from this narrow spot diffused itself at an early period over the whole surface of metaphysics. Yet it becomes us not to triumph over the great intellects of Plato and Aristotle because we are now able to preserve ourselves from many errors into which they, perhaps inevitably, fell. The fire-teazer of a modern steam-engine produces by his exertions far greater effects than Milo of Crotona could, but he is not therefore a stronger man. The Greeks seldom knew any language but their own. This rendered it far more difficult for them than it is for us, to acquire a readiness in detecting ambiguities. One of the advantages of having accurately studied a plurality of languages, especially of those languages which eminent thinkers have used as the vehicle of their thoughts, is the practical lesson we learn respecting the ambiguities of words, by finding that the same word in one language corresponds, on different occasions, to different words in another. When not thus exercised, even the strongest understandings find it difficult to believe that things which have a common name, have not in some respect or other a common nature; and often expend much labor very unprofitably (as was frequently done by the two philosophers just mentioned) in vain attempts to discover in what this common nature consists. But, the habit once formed, intellects much inferior are capable of detecting even ambiguities which are common to many languages: and it is surprising that the one now under consideration, though it exists in the modern languages as well as in the ancient, should have been overlooked by almost all authors. The quantity of futile speculation which had been caused by a misapprehension of the nature of the copula, was hinted at by Hobbes; but Mr. James Mill(25) was, I believe, the first who distinctly characterized the ambiguity, and pointed out how many errors in the received systems of philosophy it has had to answer for. It has, indeed, misled the moderns scarcely less than the ancients, though their mistakes, because our understandings are not yet so completely emancipated from their influence, do not appear equally irrational.

We shall now briefly review the principal distinctions which exist among propositions, and the technical terms most commonly in use to express those distinctions.

§ 2. A proposition being a portion of discourse in which something is affirmed or denied of something, the first division of propositions is into affirmative and negative. An affirmative proposition is that in which the predicate is _affirmed_ of the subject; as, Cæsar is dead. A negative proposition is that in which the predicate is _denied_ of the subject; as, Cæsar is not dead. The copula, in this last species of proposition, consists of the words _is not_, which are the sign of negation; _is_ being the sign of affirmation.

Some logicians, among whom may be mentioned Hobbes, state this distinction differently; they recognize only one form of copula, _is_, and attach the negative sign to the predicate. “Cæsar is dead,” and “Cæsar is not dead,” according to these writers, are propositions agreeing not in the subject and predicate, but in the subject only. They do not consider “dead,” but “not dead,” to be the predicate of the second proposition, and they accordingly define a negative proposition to be one in which the predicate is a negative name. The point, though not of much practical moment, deserves notice as an example (not unfrequent in logic) where by means of an apparent simplification, but which is merely verbal, matters are made more complex than before. The notion of these writers was, that they could get rid of the distinction between affirming and denying, by treating every case of denying as the affirming of a negative name. But what is meant by a negative name? A name expressive of the _absence_ of an attribute. So that when we affirm a negative name, what we are really predicating is absence and not presence; we are asserting not that any thing is, but that something is not; to express which operation no word seems so proper as the word denying. The fundamental distinction is between a fact and the non-existence of that fact; between seeing something and not seeing it, between Cæsar’s being dead and his not being dead; and if this were a merely verbal distinction, the generalization which brings both within the same form of assertion would be a real simplification: the distinction, however, being real, and in the facts, it is the generalization confounding the distinction that is merely verbal; and tends to obscure the subject, by treating the difference between two kinds of truths as if it were only a difference between two kinds of words. To put things together, and to put them or keep them asunder, will remain different operations, whatever tricks we may play with language.

A remark of a similar nature may be applied to most of those distinctions among propositions which are said to have reference to their _modality_; as, difference of tense or time; the sun _did_ rise, the sun _is_ rising, the sun _will_ rise. These differences, like that between affirmation and negation, might be glossed over by considering the incident of time as a mere modification of the predicate: thus, The sun is _an object having risen_, The sun is _an object now rising_, The sun is _an object to rise hereafter_. But the simplification would be merely verbal. Past, present, and future, do not constitute so many different kinds of rising; they are designations belonging to the event asserted, to the _sun’s_ rising to-day. They affect, not the predicate, but the applicability of the predicate to the particular subject. That which we affirm to be past, present, or future, is not what the subject signifies, nor what the predicate signifies, but specifically and expressly what the predication signifies; what is expressed only by the proposition as such, and not by either or both of the terms. Therefore the circumstance of time is properly considered as attaching to the copula, which is the sign of predication, and not to the predicate. If the same can not be said of such modifications as these, Cæsar _may_ be dead; Cæsar is _perhaps_ dead; it is _possible_ that Cæsar is dead; it is only because these fall altogether under another head, being properly assertions not of any thing relating to the fact itself, but of the state of our own mind in regard to it; namely, our absence of disbelief of it. Thus “Cæsar may be dead” means “I am not sure that Cæsar is alive.”

§ 3. The next division of propositions is into Simple and Complex; more aptly (by Professor Bain(26)) termed Compound. A simple proposition is that in which one predicate is affirmed or denied of one subject. A compound proposition is that in which there is more than one predicate, or more than one subject, or both.

At first sight this division has the air of an absurdity; a solemn distinction of things into one and more than one; as if we were to divide horses into single horses and teams of horses. And it is true that what is called a complex (or compound) proposition is often not a proposition at all, but several propositions, held together by a conjunction. Such, for example, is this: Cæsar is dead, and Brutus is alive: or even this, Cæsar is dead, _but_ Brutus is alive. There are here two distinct assertions; and we might as well call a street a complex house, as these two propositions a complex proposition. It is true that the syncategorematic words _and_ and _but_ have a meaning; but that meaning is so far from making the two propositions one, that it adds a third proposition to them. All particles are abbreviations, and generally abbreviations of propositions; a kind of short-hand, whereby something which, to be expressed fully, would have required a proposition or a series of propositions, is suggested to the mind at once. Thus the words, Cæsar is dead and Brutus is alive, are equivalent to these: Cæsar is dead; Brutus is alive; it is desired that the two preceding propositions should be thought of together. If the words were, Cæsar is dead, _but_ Brutus is alive, the sense would be equivalent to the same three propositions together with a fourth; “between the two preceding propositions there exists a contrast:” viz., either

between the two facts themselves, or between the feelings with which it is desired that they should be regarded.

In the instances cited the two propositions are kept visibly distinct, each subject having its separate predicate, and each predicate its separate subject. For brevity, however, and to avoid repetition, the propositions are often blended together: as in this, “Peter and James preached at Jerusalem and in Galilee,” which contains four propositions: Peter preached at Jerusalem, Peter preached in Galilee, James preached at Jerusalem, James preached in Galilee.

We have seen that when the two or more propositions comprised in what is called a complex proposition are stated absolutely, and not under any condition or proviso, it is not a proposition at all, but a plurality of propositions; since what it expresses is not a single assertion, but several assertions, which, if true when joined, are true also when separated. But there is a kind of proposition which, though it contains a plurality of subjects and of predicates, and may be said in one sense of the word to consist of several propositions, contains but one assertion; and its truth does not at all imply that of the simple propositions which compose it. An example of this is, when the simple propositions are connected by the particle _or_; as, either A is B or C is D; or by the particle _if_; as, A is B if C is D. In the former case, the proposition is called _disjunctive_, in the latter, _conditional_: the name _hypothetical_ was originally common to both.

As has been well remarked by Archbishop Whately and others, the disjunctive form is resolvable into the conditional; every disjunctive proposition being equivalent to two or more conditional ones. “Either A is B or C is D,” means, “if A is not B, C is D; and if C is not D, A is B.” All hypothetical propositions, therefore, though disjunctive in form, are conditional in meaning; and the words hypothetical and conditional may be, as indeed they generally are, used synonymously. Propositions in which the assertion is not dependent on a condition, are said, in the language of logicians, to be _categorical_.

A hypothetical proposition is not, like the pretended complex propositions which we previously considered, a mere aggregation of simple propositions. The simple propositions which form part of the words in which it is couched, form no part of the assertion which it conveys. When we say, If the Koran comes from God, Mohammed is the prophet of God, we do not intend to affirm either that the Koran does come from God, or that Mohammed is really his prophet. Neither of these simple propositions may be true, and yet the truth of the hypothetical proposition may be indisputable. What is asserted is not the truth of either of the propositions, but the inferribility of the one from the other. What, then, is the subject, and what the predicate of the hypothetical proposition? “The Koran” is not the subject of it, nor is “Mohammed:” for nothing is affirmed or denied either of the Koran or of Mohammed. The real subject of the predication is the entire proposition, “Mohammed is the prophet of God;” and the affirmation is, that this is a legitimate inference from the proposition, “The Koran comes from God.” The subject and predicate, therefore, of a hypothetical proposition are names of propositions. The subject is some one proposition. The predicate is a general relative name applicable to propositions; of this form—“an inference from so and so.” A fresh instance is here afforded of the remark, that particles are abbreviations; since “_If_ A is B, C is D,” is found to be an abbreviation of the following: “The proposition C is D, is a legitimate inference from the proposition A is B.”

The distinction, therefore, between hypothetical and categorical propositions is not so great as it at first appears. In the conditional, as well as in the categorical form, one predicate is affirmed of one subject, and no more: but a conditional proposition is a proposition concerning a proposition; the subject of the assertion is itself an assertion. Nor is this a property peculiar to hypothetical propositions. There are other classes of assertions concerning propositions. Like other things, a proposition has attributes which may be predicated of it. The attribute predicated of it in a hypothetical proposition, is that of being an inference from a certain other proposition. But this is only one of many attributes that might be predicated. We may say, That the whole is greater than its part, is an axiom in mathematics: That the Holy Ghost proceeds from the Father alone, is a tenet of the Greek Church: The doctrine of the divine right of kings was renounced by Parliament at the Revolution: The infallibility of the Pope has no countenance from Scripture. In all these cases the subject of the predication is an entire proposition. That which these different predicates are affirmed of, is _the proposition_, “the whole is greater than its part;” _the proposition_, “the Holy Ghost proceeds from the Father alone;” _the proposition_, “kings have a divine right;” _the proposition_, “the Pope is infallible.”

Seeing, then, that there is much less difference between hypothetical propositions and any others, than one might be led to imagine from their form, we should be at a loss to account for the conspicuous position which they have been selected to fill in treatises on logic, if we did not remember that what they predicate of a proposition, namely, its being an inference from something else, is precisely that one of its attributes with which most of all a logician is concerned.

§ 4. The next of the common divisions of Propositions is into Universal, Particular, Indefinite, and Singular: a distinction founded on the degree of generality in which the name, which is the subject of the proposition, is to be understood. The following are examples:

All men are mortal—Universal. _Some men_ are mortal—Particular. _Man_ is mortal—Indefinite. _Julius Cæsar_ is mortal—Singular.

The proposition is Singular, when the subject is an individual name. The individual name needs not be a proper name. “The Founder of Christianity was crucified,” is as much a singular proposition as “Christ was crucified.”

When the name which is the subject of the proposition is a general name, we may intend to affirm or deny the predicate, either of all the things that the subject denotes, or only of some. When the predicate is affirmed or denied of all and each of the things denoted by the subject, the proposition is universal; when of some undefined portion of them only, it is particular. Thus, All men are mortal; Every man is mortal; are universal propositions. No man is immortal, is also a universal proposition, since the predicate, immortal, is denied of each and every individual denoted by the term man; the negative proposition being exactly equivalent to the following, Every man is not-immortal. But “some men are wise,” “some men are not wise,” are particular propositions; the predicate _wise_ being in the one case affirmed and in the other denied not of each and every individual denoted by the term man, but only of each and every one of some portion of those individuals, without specifying what portion; for if this were specified, the proposition would be changed either into a singular proposition, or into a universal proposition with a different subject; as, for instance, “all _properly instructed_ men are wise.” There are other forms of particular propositions; as, “_Most_ men are imperfectly educated:” it being immaterial how large a portion of the subject the predicate is asserted of, as long as it is left uncertain how that portion is to be distinguished from the rest.(27)

When the form of the expression does not clearly show whether the general name which is the subject of the proposition is meant to stand for all the individuals denoted by it, or only for some of them, the proposition is, by some logicians, called Indefinite; but this, as Archbishop Whately observes, is a solecism, of the same nature as that committed by some grammarians when in their list of genders they enumerate the _doubtful_ gender. The speaker must mean to assert the proposition either as a universal or as a particular proposition, though he has failed to declare which: and it often happens that though the words do not show which of the two he intends, the context, or the custom of speech, supplies the deficiency. Thus, when it is affirmed that “Man is mortal,” nobody doubts that the assertion is intended of all human beings; and the word indicative of universality is commonly omitted, only because the meaning is evident without it. In the proposition, “Wine is good,” it is understood with equal readiness, though for somewhat different reasons, that the assertion is not intended to be universal, but particular.(28) As is observed by Professor Bain,(29) the chief examples of Indefinite propositions occur “with names of material, which are the subjects sometimes of universal, and at other times of particular predication. ‘Food is chemically constituted by carbon, oxygen, etc.,’ is a proposition of universal quantity; the meaning is all food—all kinds of food. ‘Food is necessary to animal life’ is a case of particular quantity; the meaning is some sort of food, not necessarily all sorts. ‘Metal is requisite in order to strength’ does not mean all kinds of metal. ‘Gold will make a way,’ means a portion of gold.”

When a general name stands for each and every individual which it is a name of, or in other words, which it denotes, it is said by logicians to be _distributed_, or taken distributively. Thus, in the proposition, All men are mortal, the subject, Man, is distributed, because mortality is affirmed of each and every man. The predicate, Mortal, is not distributed, because the only mortals who are spoken of in the proposition are those who happen to be men; while the word may, for aught that appears, and in fact does, comprehend within it an indefinite number of objects besides men. In the proposition, Some men are mortal, both the predicate and the subject are undistributed. In the following, No men have wings, both the predicate and the subject are distributed. Not only is the attribute of having wings denied of the entire class Man, but that class is severed and cast out from the whole of the class Winged, and not merely from some part of that class.

This phraseology, which is of great service in stating and demonstrating the rules of the syllogism, enables us to express very concisely the definitions of a universal and a particular proposition. A universal proposition is that of which the subject is distributed; a particular proposition is that of which the subject is undistributed.

There are many more distinctions among propositions than those we have here stated, some of them of considerable importance. But, for explaining and illustrating these, more suitable opportunities will occur in the sequel.

Chapter V.

Of The Import Of Propositions.

§ 1. An inquiry into the nature of propositions must have one of two objects: to analyze the state of mind called Belief, or to analyze what is believed. All language recognizes a difference between a doctrine or opinion, and the fact of entertaining the opinion; between assent, and what is assented to.

Logic, according to the conception here formed of it, has no concern with the nature of the act of judging or believing; the consideration of that act, as a phenomenon of the mind, belongs to another science. Philosophers, however, from Descartes downward, and especially from the era of Leibnitz and Locke, have by no means observed this distinction; and would have treated with great disrespect any attempt to analyze the import of Propositions, unless founded on an analysis of the act of Judgment. A proposition, they would have said, is but the expression in words of a Judgment. The thing expressed, not the mere verbal expression, is the important matter. When the mind assents to a proposition, it judges. Let us find out what the mind does when it judges, and we shall know what propositions mean, and not otherwise.

Conformably to these views, almost all the writers on Logic in the last two centuries, whether English, German, or French, have made their theory of Propositions, from one end to the other, a theory of Judgments. They considered a Proposition, or a Judgment, for they used the two words indiscriminately, to consist in affirming or denying one _idea_ of another. To judge, was to put two ideas together, or to bring one idea under another, or to compare two ideas, or to perceive the agreement or disagreement between two ideas: and the whole doctrine of Propositions, together with the theory of Reasoning (always necessarily founded on the theory of Propositions), was stated as if Ideas, or Conceptions, or whatever other term the writer preferred as a name for mental representations generally, constituted essentially the subject-matter and substance of those operations.

It is, of course, true, that in any case of judgment, as for instance when we judge that gold is yellow, a process takes place in our minds, of which some one or other of these theories is a partially correct account. We must have the idea of gold and the idea of yellow, and these two ideas must be brought together in our mind. But in the first place, it is evident that this is only a part of what takes place; for we may put two ideas together without any act of belief; as when we merely imagine something, such as a golden mountain; or when we actually disbelieve: for in order even to disbelieve that Mohammed was an apostle of God, we must put the idea of Mohammed and that of an apostle of God together. To determine what it is that happens in the case of assent or dissent besides putting two ideas together, is one of the most intricate of metaphysical problems. But whatever the solution may be, we may venture to assert that it can have nothing whatever to do with the import of propositions; for this reason, that propositions (except sometimes when the mind itself is the subject treated of) are not assertions respecting our ideas of things, but assertions respecting the things themselves. In order to believe that gold is yellow, I must, indeed, have the idea of gold, and the idea of yellow, and something having reference to those ideas must take place in my mind; but my belief has not reference to the ideas, it has reference to the things. What I believe, is a fact relating to the outward thing, gold, and to the impression made by that outward thing upon the human organs; not a fact relating to my conception of gold, which would be a fact in my mental history, not a fact of external nature. It is true, that in order to believe this fact in external nature, another fact must take place in my mind, a process must be performed upon my ideas; but so it must in every thing else that I do. I can not dig the ground unless I have the idea of the ground, and of a spade, and of all the other things I am operating upon, and unless I put those ideas together.(30) But it would be a very ridiculous description of digging the ground to say that it is putting one idea into another. Digging is an operation which is performed upon the things themselves, though it can not be performed unless I have in my mind the ideas of them. And in like manner, believing is an act which has for its subject the facts themselves, though a previous mental conception of the facts is an indispensable condition. When I say that fire causes heat, do I mean that my idea of fire causes my idea of heat? No: I mean that the natural phenomenon, fire, causes the natural phenomenon, heat. When I mean to assert any thing respecting the ideas, I give them their proper name, I call them ideas: as when I say, that a child's idea of a battle is unlike the reality, or that the ideas entertained of the Deity have a great effect on the characters of mankind.

The notion that what is of primary importance to the logician in a proposition, is the relation between the two _ideas_ corresponding to the subject and predicate (instead of the relation between the two _phenomena_ which they respectively express), seems to me one of the most fatal errors ever introduced into the philosophy of Logic; and the principal cause why the theory of the science has made such inconsiderable progress during the last two centuries. The treatises on Logic, and on the branches of Mental Philosophy connected with Logic, which have been produced since the intrusion of this cardinal error, though sometimes written by men of extraordinary abilities and attainments, almost always tacitly imply a theory that the investigation of truth consists in contemplating and handling our ideas, or conceptions of things, instead of the things themselves: a doctrine tantamount to the assertion, that the

only mode of acquiring knowledge of nature is to study it at second hand, as represented in our own minds. Meanwhile, inquiries into every kind of natural phenomena were incessantly establishing great and fruitful truths on most important subjects, by processes upon which these views of the nature of Judgment and Reasoning threw no light, and in which they afforded no assistance whatever. No wonder that those who knew by practical experience how truths are arrived at, should deem a science futile, which consisted chiefly of such speculations. What has been done for the advancement of Logic since these doctrines came into vogue, has been done not by professed logicians, but by discoverers in the other sciences; in whose methods of investigation many principles of logic, not previously thought of, have successively come forth into light, but who have generally committed the error of supposing that nothing whatever was known of the art of philosophizing by the old logicians, because their modern interpreters have written to so little purpose respecting it.

We have to inquire, then, on the present occasion, not into Judgment, but judgments; not into the act of believing, but into the thing believed. What is the immediate object of belief in a Proposition? What is the matter of fact signified by it? What is it to which, when I assert the proposition, I give my assent, and call upon others to give theirs? What is that which is expressed by the form of discourse called a Proposition, and the conformity of which to fact constitutes the truth of the proposition?

§ 2. One of the clearest and most consecutive thinkers whom this country or the world has produced, I mean Hobbes, has given the following answer to this question. In every proposition (says he) what is signified is, the belief of the speaker that the predicate is a name of the same thing of which the subject is a name; and if it really is so, the proposition is true. Thus the proposition, All men are living beings (he would say) is true, because _living being_ is a name of every thing of which _man_ is a name. All men are six feet high, is not true, because _six feet high_ is not a name of every thing (though it is of some things) of which _man_ is a name.

What is stated in this theory as the definition of a true proposition, must be allowed to be a property which all true propositions possess. The subject and predicate being both of them names of things, if they were names of quite different things the one name could not, consistently with its signification, be predicated of the other. If it be true that some men are copper-colored, it must be true—and the proposition does really assert—that among the individuals denoted by the name man, there are some who are also among those denoted by the name copper-colored. If it be true that all oxen ruminate, it must be true that all the individuals denoted by the name ox are also among those denoted by the name ruminating; and whoever asserts that all oxen ruminate, undoubtedly does assert that this relation subsists between the two names.

The assertion, therefore, which, according to Hobbes, is the only one made in any proposition, really is made in every proposition: and his analysis has consequently one of the requisites for being the true one. We may go a step further; it is the only analysis that is rigorously true of all propositions without exception. What he gives as the meaning of propositions, is part of the meaning of all propositions, and the whole meaning of some. This, however, only shows what an extremely minute fragment of meaning it is quite possible to include within the logical formula of a proposition. It does not show that no proposition means more. To warrant us in putting together two words with a copula between them, it is really enough that the thing or things denoted by one of the names should be capable, without violation of usage, of being called by the other name also. If, then, this be all the meaning necessarily implied in the form of discourse called a Proposition, why do I object to it as the scientific definition of what a proposition means? Because, though the mere collocation which makes the proposition a proposition, conveys no more than this scanty amount of meaning, that same collocation combined with other circumstances, that _form_ combined with other _matter_, does convey more, and the proposition in those other circumstances does assert more, than merely that relation between the two names.

The only propositions of which Hobbes's principle is a sufficient account, are that limited and unimportant class in which both the predicate and the subject are proper names. For, as has already been remarked, proper names have strictly no meaning; they are mere marks for individual objects: and when a proper name is predicated of another proper name, all the signification conveyed is, that both the names are marks for the same object. But this is precisely what Hobbes produces as a theory of predication in general. His doctrine is a full explanation of such predications as these: Hyde was Clarendon, or, Tully is Cicero. It exhausts the meaning of those propositions. But it is a sadly inadequate theory of any others. That it should ever have been thought of as such, can be accounted for only by the fact, that Hobbes, in common with the other Nominalists, bestowed little or no attention upon the _connotation_ of words; and sought for their meaning exclusively in what they _denote_: as if all names had been (what none but proper names really are) marks put upon individuals; and as if there were no difference between a proper and a general name, except that the first denotes only one individual, and the last a greater number.

It has been seen, however, that the meaning of all names, except proper names and that portion of the class of abstract names which are not connotative, resides in the connotation. When, therefore, we are analyzing the meaning of any proposition in which

the predicate and the subject, or either of them, are connotative names, it is to the connotation of those terms that we must exclusively look, and not to what they _denote_, or in the language of Hobbes (language so far correct) are names of.

In asserting that the truth of a proposition depends on the conformity of import between its terms, as, for instance, that the proposition, Socrates is wise, is a true proposition, because Socrates and wise are names applicable to, or, as he expresses it, names of, the same person; it is very remarkable that so powerful a thinker should not have asked himself the question, But how came they to be names of the same person? Surely not because such was the intention of those who invented the words. When mankind fixed the meaning of the word wise, they were not thinking of Socrates, nor, when his parents gave him the name of Socrates, were they thinking of wisdom. The names _happen_ to fit the same person because of a certain _fact_, which fact was not known, nor in being, when the names were invented. If we want to know what the fact is, we shall find the clue to it in the _connotation_ of the names.

A bird or a stone, a man, or a wise man, means simply, an object having such and such attributes. The real meaning of the word man, is those attributes, and not Smith, Brown, and the remainder of the individuals. The word _mortal_, in like manner connotes a certain attribute or attributes; and when we say, All men are mortal, the meaning of the proposition is, that all beings which possess the one set of attributes, possess also the other. If, in our experience, the attributes connoted by _man_ are always accompanied by the attribute connoted by _mortal_, it will follow as a consequence, that the class _man_ will be wholly included in the class _mortal_, and that _mortal_ will be a name of all things of which _man_ is a name: but why? Those objects are brought under the name, by possessing the attributes connoted by it: but their possession of the attributes is the real condition on which the truth of the proposition depends; not their being called by the name. Connotative names do not precede, but follow, the attributes which they connote. If one attribute happens to be always found in conjunction with another attribute, the concrete names which answer to those attributes will of course be predicable of the same subjects, and may be said, in Hobbes's language (in the propriety of which on this occasion I fully concur), to be two names for the same things. But the possibility of a concurrent application of the two names, is a mere consequence of the conjunction between the two attributes, and was, in most cases, never thought of when the names were introduced and their signification fixed. That the diamond is combustible, was a proposition certainly not dreamed of when the words Diamond and Combustible first received their meaning; and could not have been discovered by the most ingenious and refined analysis of the signification of those words. It was found out by a very different process, namely, by exerting the senses, and learning from them, that the attribute of combustibility existed in the diamonds upon which the experiment was tried; the number or character of the experiments being such, that what was true of those individuals might be concluded to be true of all substances "called by the name," that is, of all substances possessing the attributes which the name connotes. The assertion, therefore, when analyzed, is, that wherever we find certain attributes, there will be found a certain other attribute: which is not a question of the signification of names, but of laws of nature; the order existing among phenomena.

§ 3. Although Hobbes's theory of Predication has not, in the terms in which he stated it, met with a very favorable reception from subsequent thinkers, a theory virtually identical with it, and not by any means so perspicuously expressed, may almost be said to have taken the rank of an established opinion. The most generally received notion of Predication decidedly is that it consists in referring something to a class, _i.e._, either placing an individual under a class, or placing one class under another class. Thus, the proposition, Man is mortal, asserts, according to this view of it, that the class man is included in the class mortal. "Plato is a philosopher," asserts that the individual Plato is one of those who compose the class philosopher. If the proposition is negative, then instead of placing something in a class, it is said to exclude something from a class. Thus, if the following be the proposition, The elephant is not carnivorous; what is asserted (according to this theory) is, that the elephant is excluded from the class carnivorous, or is not numbered among the things comprising that class. There is no real difference, except in language, between this theory of Predication and the theory of Hobbes. For a class _is_ absolutely nothing but an indefinite number of individuals denoted by a general name. The name given to them in common, is what makes them a class. To refer any thing to a class, therefore, is to look upon it as one of the things which are to be called by that common name. To exclude it from a class, is to say that the common name is not applicable to it.

How widely these views of predication have prevailed, is evident from this, that they are the basis of the celebrated _dictum de omni et nullo_. When the syllogism is resolved, by all who treat of it, into an inference that what is true of a class is true of all things whatever that belong to the class; and when this is laid down by almost all professed logicians as the ultimate principle to which all reasoning owes its validity; it is clear that in the general estimation of logicians, the propositions of which reasonings are composed can be the expression of nothing but the process of dividing things into classes, and referring every thing to its proper class.

This theory appears to me a signal example of a logical error very often committed in logic, that of ■στερον προτ■ρον, or explaining a thing by something which presupposes it. When I say that snow is white, I may and ought to be thinking of snow as a class, because I am asserting a proposition as true of all snow: but I am certainly not thinking of white objects as a class; I am thinking of no white object whatever except snow, but only of that, and of the sensation of white which it gives me. When, indeed, I have judged, or assented to the propositions, that snow is white, and that several other things are also white, I gradually begin to think of white objects as a class, including snow and those other things. But this is a conception which followed, not preceded, those judgments, and therefore can not be given as an explanation of them. Instead of explaining the effect by the cause, this doctrine explains the cause by the effect, and is, I conceive, founded on a latent misconception of the nature of classification.

There is a sort of language very generally prevalent in these discussions, which seems to suppose that classification is an arrangement and grouping of definite and known individuals: that when names were imposed, mankind took into consideration all the individual objects in the universe, distributed them into parcels or lists, and gave to the objects of each list a common name, repeating this operation _toties quoties_ until they had invented all the general names of which language consists; which having been once done, if a question subsequently arises whether a certain general name can be truly predicated of a certain particular object, we have only (as it were) to read the roll of the objects upon which that name was conferred, and see whether the object about which the question arises is to be found among them. The framers of language (it would seem to be supposed) have predetermined all the objects that are to compose each class, and we have only to refer to the record of an antecedent decision.

So absurd a doctrine will be owned by nobody when thus nakedly stated; but if the commonly received explanations of classification and naming do not imply this theory, it requires to be shown how they admit of being reconciled with any other.

General names are not marks put upon definite objects; classes are not made by drawing a line round a given number of assignable individuals. The objects which compose any given class are perpetually fluctuating. We may frame a class without knowing the individuals, or even any of the individuals, of which it may be composed; we may do so while believing that no such individuals exist. If by the _meaning_ of a general name are to be understood the things which it is the name of, no general name, except by accident, has a fixed meaning at all, or ever long retains the same meaning. The only mode in which any general name has a definite meaning, is by being a name of an indefinite variety of things; namely, of all things, known or unknown, past, present, or future, which possess certain definite attributes. When, by studying not the meaning of words, but the phenomena of nature, we discover that these attributes are possessed by some object not previously known to possess them (as when chemists found that the diamond was combustible), we include this new object in the class; but it did not already belong to the class. We place the individual in the class because the proposition is true; the proposition is not true because the object is placed in the class.(31)

It will appear hereafter, in treating of reasoning, how much the theory of that intellectual process has been vitiated by the influence of these erroneous notions, and by the habit which they exemplify of assimilating all the operations of the human understanding which have truth for their object, to processes of mere classification and naming. Unfortunately, the minds which have been entangled in this net are precisely those which have escaped the other cardinal error commented upon in the beginning of the present chapter. Since the revolution which dislodged Aristotle from the schools, logicians may almost be divided into those who have looked upon reasoning as essentially an affair of Ideas, and those who have looked upon it as essentially an affair of Names.

Although, however, Hobbes's theory of Predication, according to the well-known remark of Leibnitz, and the avowal of Hobbes himself,(32) renders truth and falsity completely arbitrary, with no standard but the will of men, it must not be concluded that either Hobbes, or any of the other thinkers who have in the main agreed with him, did in fact consider the distinction between truth and error as less real, or attached less importance to it, than other people. To suppose that they did so would argue total unacquaintance with their other speculations. But this shows how little hold their doctrine possessed over their own minds. No person, at bottom, ever imagined that there was nothing more in truth than propriety of expression; than using language in conformity to a previous convention. When the inquiry was brought down from generals to a particular case, it has always been acknowledged that there is a distinction between verbal and real questions; that some false propositions are uttered from ignorance of the meaning of words, but that in others the source of the error is a misapprehension of things; that a person who has not the use of language at all may form propositions mentally, and that they may be untrue—that is, he may believe as matters of fact what are not really so. This last admission can not be made in stronger terms than it is by Hobbes himself,(33) though he will not allow such erroneous belief to be called falsity, but only error. And he has himself laid down, in other places, doctrines in which the true theory of predication is by implication contained. He distinctly says that general names are given to things on account of their attributes, and that abstract names are the names of those attributes. "Abstract is that which in any subject denotes the cause of the concrete name.... And these causes of names are the same with the causes of our conceptions, namely, some power of action, or affection,

of the thing conceived, which some call the manner by which any thing works upon our senses, but by most men they are called _accidents_."(34) It is strange that having gone so far, he should not have gone one step further, and seen that what he calls the cause of the concrete name, is in reality the meaning of it; and that when we predicate of any subject a name which is given _because_ of an attribute (or, as he calls it, an accident), our object is not to affirm the name, but, by means of the name, to affirm the attribute.

§ 4. Let the predicate be, as we have said, a connotative term; and to take the simplest case first, let the subject be a proper name: "The summit of Chimborazo is white." The word white connotes an attribute which is possessed by the individual object designated by the words "summit of Chimborazo;" which attribute consists in the physical fact, of its exciting in human beings the sensation which we call a sensation of white. It will be admitted that, by asserting the proposition, we wish to communicate information of that physical fact, and are not thinking of the names, except as the necessary means of making that communication. The meaning of the proposition, therefore, is, that the individual thing denoted by the subject, has the attributes connoted by the predicate.

If we now suppose the subject also to be a connotative name, the meaning expressed by the proposition has advanced a step further in complication. Let us first suppose the proposition to be universal, as well as affirmative: "All men are mortal." In this case, as in the last, what the proposition asserts (or expresses a belief of) is, of course, that the objects denoted by the subject (man) possess the attributes connoted by the predicate (mortal). But the characteristic of this case is, that the objects are no longer _individually_ designated. They are pointed out only by some of their attributes: they are the objects called men, that is, possessing the attributes connoted by the name man; and the only thing known of them may be those attributes: indeed, as the proposition is general, and the objects denoted by the subject are therefore indefinite in number, most of them are not known individually at all. The assertion, therefore, is not, as before, that the attributes which the predicate connotes are possessed by any given individual, or by any number of individuals previously known as John, Thomas, etc., but that those attributes are possessed by each and every individual possessing certain other attributes; that whatever has the attributes connoted by the subject, has also those connoted by the predicate; that the latter set of attributes _constantly accompany_ the former set. Whatever has the attributes of man has the attribute of mortality; mortality constantly accompanies the attributes of man.(35)

If it be remembered that every attribute is _grounded_ on some fact or phenomenon, either of outward sense or of inward consciousness, and that to _possess_ an attribute is another phrase for being the cause of, or forming part of, the fact or phenomenon upon which the attribute is grounded; we may add one more step to complete the analysis. The proposition which asserts that one attribute always accompanies another attribute, really asserts thereby no other thing than this, that one phenomenon always accompanies another phenomenon; insomuch that where we find the latter, we have assurance of the existence of the former. Thus, in the proposition, All men are mortal, the word man connotes the attributes which we ascribe to a certain kind of living creatures, on the ground of certain phenomena which they exhibit, and which are partly physical phenomena, namely the impressions made on our senses by their bodily form and structure, and partly mental phenomena, namely the sentient and intellectual life which they have of their own. All this is understood when we utter the word man, by any one to whom the meaning of the word is known. Now, when we say, Man is mortal, we mean that wherever these various physical and mental phenomena are all found, there we have assurance that the other physical and mental phenomenon, called death, will not fail to take place. The proposition does not affirm _when_; for the connotation of the word _mortal_ goes no further than to the occurrence of the phenomenon at some time or other, leaving the particular time undecided.

§ 5. We have already proceeded far enough, not only to demonstrate the error of Hobbes, but to ascertain the real import of by far the most numerous class of propositions. The object of belief in a proposition, when it asserts any thing more than the meaning of words, is generally, as in the cases which we have examined, either the co-existence or the sequence of two phenomena. At the very commencement of our inquiry, we found that every act of belief implied two Things: we have now ascertained what, in the most frequent case, these two things are, namely, two Phenomena; in other words, two states of consciousness; and what it is which the proposition affirms (or denies) to subsist between them, namely, either succession or co-existence. And this case includes innumerable instances which no one, previous to reflection, would think of referring to it. Take the following example: A generous person is worthy of honor. Who would expect to recognize here a case of co-existence between phenomena? But so it is. The attribute which causes a person to be termed generous, is ascribed to him on the ground of states of his mind, and particulars of his conduct: both are phenomena: the former are facts of internal consciousness; the latter, so far as distinct from the former, are physical facts, or perceptions of the senses. Worthy of honor admits of a similar analysis. Honor, as here used, means a state of approving and admiring emotion, followed on occasion by corresponding outward acts. "Worthy of honor" connotes all this, together with our approval of the act of showing honor. All these are phenomena; states of internal consciousness, accompanied or followed

by physical facts. When we say, A generous person is worthy of honor, we affirm co-existence between the two complicated phenomena connoted by the two terms respectively. We affirm, that wherever and whenever the inward feelings and outward facts implied in the word generosity have place, then and there the existence and manifestation of an inward feeling, honor, would be followed in our minds by another inward feeling, approval.

After the analysis, in a former chapter, of the import of names, many examples are not needed to illustrate the import of propositions. When there is any obscurity, or difficulty, it does not lie in the meaning of the proposition, but in the meaning of the names which compose it; in the extremely complicated connotation of many words; the immense multitude and prolonged series of facts which often constitute the phenomenon connoted by a name. But where it is seen what the phenomenon is, there is seldom any difficulty in seeing that the assertion conveyed by the proposition is, the co-existence of one such phenomenon with another; or the succession of one such phenomenon to another: so that where the one is found, we may calculate on finding the other, though perhaps not conversely.

This, however, though the most common, is not the only meaning which propositions are ever intended to convey. In the first place, sequences and co-existences are not only asserted respecting Phenomena; we make propositions also respecting those hidden causes of phenomena, which are named substances and attributes. A substance, however, being to us nothing but either that which causes, or that which is conscious of, phenomena; and the same being true, _mutatis mutandis_, of attributes; no assertion can be made, at least with a meaning, concerning these unknown and unknowable entities, except in virtue of the Phenomena by which alone they manifest themselves to our faculties. When we say Socrates was contemporary with the Peloponnesian war, the foundation of this assertion, as of all assertions concerning substances, is an assertion concerning the phenomena which they exhibit—namely, that the series of facts by which Socrates manifested himself to mankind, and the series of mental states which constituted his sentient existence, went on simultaneously with the series of facts known by the name of the Peloponnesian war. Still, the proposition as commonly understood does not assert that alone; it asserts that the Thing in itself, the _noumenon_ Socrates, was existing, and doing or experiencing those various facts during the same time. Co-existence and sequence, therefore, may be affirmed or denied not only between phenomena, but between noumena, or between a noumenon and phenomena. And both of noumena and of phenomena we may affirm simple existence. But what is a noumenon? An unknown cause. In affirming, therefore, the existence of a noumenon, we affirm causation. Here, therefore, are two additional kinds of fact, capable of being asserted in a proposition. Besides the propositions which assert Sequence or Co-existence, there are some which assert simple Existence;(36) and others assert Causation, which, subject to the explanations which will follow in the Third Book, must be considered provisionally as a distinct and peculiar kind of assertion.

§ 6. To these four kinds of matter-of-fact or assertion, must be added a fifth, Resemblance. This was a species of attribute which we found it impossible to analyze; for which no _fundamentum_, distinct from the objects themselves, could be assigned. Besides propositions which assert a sequence or co-existence between two phenomena, there are therefore also propositions which assert resemblance between them; as, This color is like that color; The heat of to-day is _equal_ to the heat of yesterday. It is true that such an assertion might with some plausibility be brought within the description of an affirmation of sequence, by considering it as an assertion that the simultaneous contemplation of the two colors is _followed_ by a specific feeling termed the feeling of resemblance. But there would be nothing gained by incumbering ourselves, especially in this place, with a generalization which may be looked upon as strained. Logic does not undertake to analyze mental facts into their ultimate elements. Resemblance between two phenomena is more intelligible in itself than any explanation could make it, and under any classification must remain specifically distinct from the ordinary cases of sequence and co-existence.

It is sometimes said, that all propositions whatever, of which the predicate is a general name, do, in point of fact, affirm or deny resemblance. All such propositions affirm that a thing belongs to a class; but things being classed together according to their resemblance, every thing is of course classed with the things which it is supposed to resemble most; and thence, it may be said, when we affirm that Gold is a metal, or that Socrates is a man, the affirmation intended is, that gold resembles other metals, and Socrates other men, more nearly than they resemble the objects contained in any other of the classes co-ordinate with these.

There is some slight degree of foundation for this remark, but no more than a slight degree. The arrangement of things into classes, such as the class _metal_, or the class _man_, is grounded indeed on a resemblance among the things which are placed in the same class, but not on a mere general resemblance: the resemblance it is grounded on consists in the possession by all those things, of certain common peculiarities; and those peculiarities it is which the terms connote, and which the propositions consequently assert; not the resemblance. For though when I say, Gold is a metal, I say by implication that if there be any other metals it must resemble them, yet if there were no other metals I might still assert the proposition with the same meaning as at

present, namely, that gold has the various properties implied in the word metal; just as it might be said, Christians are men, even if there were no men who were not Christians. Propositions, therefore, in which objects are referred to a class because they possess the attributes constituting the class, are so far from asserting nothing but resemblance, that they do not, properly speaking, assert resemblance at all.

But we remarked some time ago (and the reasons of the remark will be more fully entered into in a subsequent Book(37)) that there is sometimes a convenience in extending the boundaries of a class so as to include things which possess in a very inferior degree, if in any, some of the characteristic properties of the class—provided they resemble that class more than any other, insomuch that the general propositions which are true of the class, will be nearer to being true of those things than any other equally general propositions. For instance, there are substances called metals which have very few of the properties by which metals are commonly recognized; and almost every great family of plants or animals has a few anomalous genera or species on its borders, which are admitted into it by a sort of courtesy, and concerning which it has been matter of discussion to what family they properly belonged. Now when the class-name is predicated of any object of this description, we do, by so predicating it, affirm resemblance and nothing more. And in order to be scrupulously correct it ought to be said, that in every case in which we predicate a general name, we affirm, not absolutely that the object possesses the properties designated by the name, but that it _either_ possesses those properties, or if it does not, at any rate resembles the things which do so, more than it resembles any other things. In most cases, however, it is unnecessary to suppose any such alternative, the latter of the two grounds being very seldom that on which the assertion is made: and when it is, there is generally some slight difference in the form of the expression, as, This species (or genus) is _considered_, or _may be ranked_, as belonging to such and such a family: we should hardly say positively that it does belong to it, unless it possessed unequivocally the properties of which the class-name is scientifically significant.

There is still another exceptional case, in which, though the predicate is the name of a class, yet in predicating it we affirm nothing but resemblance, the class being founded not on resemblance in any given particular, but on general unanalyzable resemblance. The classes in question are those into which our simple sensations, or other simple feelings, are divided. Sensations of white, for instance, are classed together, not because we can take them to pieces, and say they are alike in this, and not alike in that, but because we feel them to be alike altogether, though in different degrees. When, therefore, I say, The color I saw yesterday was a white color, or, The sensation I feel is one of tightness, in both cases the attribute I affirm of the color or of the other sensation is mere resemblance—simple _likeness_ to sensations which I have had before, and which have had those names bestowed upon them. The names of feelings, like other concrete general names, are connotative; but they connote a mere resemblance. When predicated of any individual feeling, the information they convey is that of its likeness to the other feelings which we have been accustomed to call by the same name. Thus much may suffice in illustration of the kind of propositions in which the matter-of-fact asserted (or denied) is simple Resemblance.

Existence, Co-existence, Sequence, Causation, Resemblance: one or other of these is asserted (or denied) in every proposition which is not merely verbal. This five-fold division is an exhaustive classification of matters-of-fact; of all things that can be believed, or tendered for belief; of all questions that can be propounded, and all answers that can be returned to them.

Professor Bain(38) distinguishes two kinds of Propositions of Co-existence. “In the one kind, account is taken of Place; they may be described as propositions of Order in Place.” In the other kind, the co-existence which is predicated is termed by Mr. Bain Co-inherence of Attributes. “This is a distinct variety of Propositions of Co-existence. Instead of an arrangement in place with numerical intervals, we have the concurrence of two or more attributes or powers in the same part or locality. A mass of gold contains, in every atom, the concurring attributes that mark the substance—weight, hardness, color, lustre, incorrosibility, etc. An animal, besides having parts situated in place, has co-inhering functions in the same parts, exerted by the very same masses and molecules of its substance.... The Mind, which affords no Propositions of Order in Place, has co-inhering functions. We affirm mind to contain Feeling, Will, and Thought, not in local separation, but in commingling exercise. The concurring properties of minerals, of plants, and of the bodily and the mental structure of animals, are united in affirmations of co-inherence.”

The distinction is real and important. But, as has been seen, an Attribute, when it is any thing but a simple unanalyzable Resemblance between the subject and some other things, consists in causing impressions of some sort on consciousness. Consequently, the co-inherence of two attributes is but the co-existence of the two states of consciousness implied in their meaning: with the difference, however, that this co-existence is sometimes potential only, the attribute being considered as in existence, though the fact on which it is grounded may not be actually, but only potentially present. Snow, for instance, is, with great convenience, said to be white even in a state of total darkness, because, though we are not now conscious of the color, we shall be conscious of it as soon as morning breaks. Co-inherence of attributes is therefore still a case, though a complex one, of

co-existence of states of consciousness; a totally different thing, however, from Order in Place. Being a part of simultaneity, it belongs not to Place but to Time.

We may therefore (and we shall sometimes find it a convenience) instead of Co-existence and Sequence, say, for greater particularity, Order in Place and Order in Time: Order in Place being a specific mode of co-existence, not necessary to be more particularly analyzed here; while the mere fact of co-existence, whether between actual sensations, or between the potentialities of causing them, known by the name of attributes, may be classed, together with Sequence, under the head of Order in Time.

§ 7. In the foregoing inquiry into the import of propositions, we have thought it necessary to analyze directly those alone, in which the terms of the proposition (or the predicate at least) are concrete terms. But, in doing so, we have indirectly analyzed those in which the terms are abstract. The distinction between an abstract term and its corresponding concrete, does not turn upon any difference in what they are appointed to signify; for the real signification of a concrete general name is, as we have so often said, its connotation; and what the concrete term connotes, forms the entire meaning of the abstract name. Since there is nothing in the import of an abstract name which is not in the import of the corresponding concrete, it is natural to suppose that neither can there be any thing in the import of a proposition of which the terms are abstract, but what there is in some proposition which can be framed of concrete terms.

And this presumption a closer examination will confirm. An abstract name is the name of an attribute, or combination of attributes. The corresponding concrete is a name given to things, because of, and in order to express, their possessing that attribute, or that combination of attributes. When, therefore, we predicate of any thing a concrete name, the attribute is what we in reality predicate of it. But it has now been shown that in all propositions of which the predicate is a concrete name, what is really predicated is one of five things: Existence, Co-existence, Causation, Sequence, or Resemblance. An attribute, therefore, is necessarily either an existence, a co-existence, a causation, a sequence, or a resemblance. When a proposition consists of a subject and predicate which are abstract terms, it consists of terms which must necessarily signify one or other of these things. When we predicate of any thing an abstract name, we affirm of the thing that it is one or other of these five things; that it is a case of Existence, or of Co-existence, or of Causation, or of Sequence, or of Resemblance.

It is impossible to imagine any proposition expressed in abstract terms, which can not be transformed into a precisely equivalent proposition in which the terms are concrete; namely, either the concrete names which connote the attributes themselves, or the names of the _fundamenta_ of those attributes; the facts or phenomena on which they are grounded. To illustrate the latter case, let us take this proposition, of which the subject only is an abstract name, “Thoughtlessness is dangerous.” Thoughtlessness is an attribute, grounded on the facts which we call thoughtless actions; and the proposition is equivalent to this, Thoughtless actions are dangerous. In the next example the predicate as well as the subject are abstract names: “Whiteness is a color;” or “The color of snow is a whiteness.” These attributes being grounded on sensations, the equivalent propositions in the concrete would be, The sensation of white is one of the sensations called those of color—The sensation of sight, caused by looking at snow, is one of the sensations called sensations of white. In these propositions, as we have before seen, the matter-of-fact asserted is a Resemblance. In the following examples, the concrete terms are those which directly correspond to the abstract names; connoting the attribute which these denote. “Prudence is a virtue:” this may be rendered, “All prudent persons, _in so far as_ prudent, are virtuous:” “Courage is deserving of honor;” thus, “All courageous persons are deserving of honor _in so far_ as they are courageous:” which is equivalent to this—“All courageous persons deserve an addition to the honor, or a diminution of the disgrace, which would attach to them on other grounds.”

In order to throw still further light upon the import of propositions of which the terms are abstract, we will subject one of the examples given above to a minuter analysis. The proposition we shall select is the following: “Prudence is a virtue.” Let us substitute for the word virtue an equivalent but more definite expression, such as “a mental quality beneficial to society,” or “a mental quality pleasing to God,” or whatever else we adopt as the definition of virtue. What the proposition asserts is a sequence, accompanied with causation; namely, that benefit to society, or that the approval of God, is consequent on, and caused by, prudence. Here is a sequence; but between what? We understand the consequent of the sequence, but we have yet to analyze the antecedent. Prudence is an attribute; and, in connection with it, two things besides itself are to be considered; prudent persons, who are the _subjects_ of the attribute, and prudential conduct, which may be called the _foundation_ of it. Now is either of these the antecedent? and, first, is it meant, that the approval of God, or benefit to society, is attendant upon all prudent _persons_? No; except _in so far_ as they are prudent; for prudent persons who are scoundrels can seldom, on the whole, be beneficial to society, nor can they be acceptable to a good being. Is it upon prudential _conduct_, then, that divine approbation and benefit to mankind are supposed to be invariably consequent? Neither is this the assertion meant, when it is said that prudence is a virtue; except with

the same reservation as before, and for the same reason, namely, that prudential conduct, although in _so far as_ it is prudential it is beneficial to society, may yet, by reason of some other of its qualities, be productive of an injury outweighing the benefit, and deserve a displeasure exceeding the approbation which would be due to the prudence. Neither the substance, therefore (viz., the person), nor the phenomenon (the conduct), is an antecedent on which the other term of the sequence is universally consequent. But the proposition, “Prudence is a virtue,” is a universal proposition. What is it, then, upon which the proposition affirms the effects in question to be universally consequent? Upon that in the person, and in the conduct, which causes them to be called prudent, and which is equally in them when the action, though prudent, is wicked; namely, a correct foresight of consequences, a just estimation of their importance to the object in view, and repression of any unreflecting impulse at variance with the deliberate purpose. These, which are states of the person’s mind, are the real antecedent in the sequence, the real cause in the causation, asserted by the proposition. But these are also the real ground, or foundation, of the attribute Prudence; since wherever these states of mind exist we may predicate prudence, even before we know whether any conduct has followed. And in this manner every assertion respecting an attribute, may be transformed into an assertion exactly equivalent respecting the fact or phenomenon which is the ground of the attribute. And no case can be assigned, where that which is predicated of the fact or phenomenon, does not belong to one or other of the five species formerly enumerated: it is either simple Existence, or it is some Sequence, Co-existence, Causation, or Resemblance.

And as these five are the only things which can be affirmed, so are they the only things which can be denied. “No horses are web-footed” denies that the attributes of a horse ever co-exist with web-feet. It is scarcely necessary to apply the same analysis to Particular affirmations and negations. “Some birds are web-footed,” affirms that, with the attributes connoted by _bird_, the phenomenon web-feet is sometimes co-existent: “Some birds are not web-footed,” asserts that there are other instances in which this co-existence does not have place. Any further explanation of a thing which, if the previous exposition has been assented to, is so obvious, may here be spared.

Chapter VI.

Of Propositions Merely Verbal.

§ 1. As a preparation for the inquiry which is the proper object of Logic, namely, in what manner propositions are to be proved, we have found it necessary to inquire what they contain which requires, or is susceptible of, proof; or (which is the same thing) what they assert. In the course of this preliminary investigation into the import of Propositions, we examined the opinion of the Conceptualists, that a proposition is the expression of a relation between two ideas; and the doctrine of the extreme Nominalists, that it is the expression of an agreement or disagreement between the meanings of two names. We decided that, as general theories, both of these are erroneous; and that, though propositions may be made both respecting names and respecting ideas, neither the one nor the other are the subject-matter of Propositions considered generally. We then examined the different kinds of Propositions, and found that, with the exception of those which are merely verbal, they assert five different kinds of matters of fact, namely, Existence, Order in Place, Order in Time, Causation, and Resemblance; that in every proposition one of these five is either affirmed, or denied, of some fact or phenomenon, or of some object the unknown source of a fact or phenomenon.

In distinguishing, however, the different kinds of matters of fact asserted in propositions, we reserved one class of propositions, which do not relate to any matter of fact, in the proper sense of the term at all, but to the meaning of names. Since names and their signification are entirely arbitrary, such propositions are not, strictly speaking, susceptible of truth or falsity, but only of conformity or disconformity to usage or convention; and all the proof they are capable of, is proof of usage; proof that the words have been employed by others in the acceptation in which the speaker or writer desires to use them. These propositions occupy, however, a conspicuous place in philosophy; and their nature and characteristics are of as much importance in logic, as those of any of the other classes of propositions previously adverted to.

If all propositions respecting the signification of words were as simple and unimportant as those which served us for examples when examining Hobbes’s theory of predication, viz., those of which the subject and predicate are proper names, and which assert only that those names have, or that they have not, been conventionally assigned to the same individual, there would be little to attract to such propositions the attention of philosophers. But the class of merely verbal propositions embraces not only much more than these, but much more than any propositions which at first sight present themselves as verbal; comprehending a kind of assertions which have been regarded not only as relating to things, but as having actually a more intimate relation with them than any other propositions whatever. The student in philosophy will perceive that I allude to the distinction on which so much stress was

laid by the schoolmen, and which has been retained either under the same or under other names by most metaphysicians to the present day, viz., between what were called _essential_, and what were called _accidental_, propositions, and between essential and accidental properties or attributes.

§ 2. Almost all metaphysicians prior to Locke, as well as many since his time, have made a great mystery of Essential Predication, and of predicates which are said to be of the _essence_ of the subject. The essence of a thing, they said, was that without which the thing could neither be, nor be conceived to be. Thus, rationality was of the essence of man, because without rationality, man could not be conceived to exist. The different attributes which made up the essence of the thing were called its essential properties; and a proposition in which any of these were predicated of it was called an Essential Proposition, and was considered to go deeper into the nature of the thing, and to convey more important information respecting it, than any other proposition could do. All properties, not of the essence of the thing, were called its accidents; were supposed to have nothing at all, or nothing comparatively, to do with its inmost nature; and the propositions in which any of these were predicated of it were called Accidental Propositions. A connection may be traced between this distinction, which originated with the schoolmen, and the well-known dogmas of _substantiæ secundæ_ or general substances, and _substantial forms_, doctrines which under varieties of language pervaded alike the Aristotelian and the Platonic schools, and of which more of the spirit has come down to modern times than might be conjectured from the disuse of the phraseology. The false views of the nature of classification and generalization which prevailed among the schoolmen, and of which these dogmas were the technical expression, afford the only explanation which can be given of their having misunderstood the real nature of those Essences which held so conspicuous a place in their philosophy. They said, truly, that _man_ can not be conceived without rationality. But though _man_ can not, a being may be conceived exactly like a man in all points except that one quality, and those others which are the conditions or consequences of it. All, therefore, which is really true in the assertion that man can not be conceived without rationality, is only, that if he had not rationality, he would not be reputed a man. There is no impossibility in conceiving the _thing_, nor, for aught we know, in its existing: the impossibility is in the conventions of language, which will not allow the thing, even if it exist, to be called by the name which is reserved for rational beings. Rationality, in short, is involved in the meaning of the word man: is one of the attributes connoted by the name. The essence of man, simply means the whole of the attributes connoted by the word; and any one of those attributes taken singly, is an essential property of man.

But these reflections, so easy to us, would have been difficult to persons who thought, as most of the later Aristotelians did, that objects were made what they were called, that gold (for instance) was made gold, not by the possession of certain properties to which mankind have chosen to attach that name, but by participation in the nature of a general substance, called gold in general, which substance, together with all the properties that belonged to it, _inhered_ in every individual piece of gold.(39) As they did not consider these universal substances to be attached to all general names, but only to some, they thought that an object borrowed only a part of its properties from a universal substance, and that the rest belonged to it individually: the former they called its essence, and the latter its accidents. The scholastic doctrine of essences long survived the theory on which it rested, that of the existence of real entities corresponding to general terms; and it was reserved for Locke, at the end of the seventeenth century, to convince philosophers that the supposed essences of classes were merely the signification of their names; nor, among the signal services which his writings rendered to philosophy, was there one more needful or more valuable.

Now, as the most familiar of the general names by which an object is designated usually connotes not one only, but several attributes of the object, each of which attributes separately forms also the bond of union of some class, and the meaning of some general name; we may predicate of a name which connotes a variety of attributes, another name which connotes only one of these attributes, or some smaller number of them than all. In such cases, the universal affirmative proposition will be true; since whatever possesses the whole of any set of attributes, must possess any part of that same set. A proposition of this sort, however, conveys no information to any one who previously understood the whole meaning of the terms. The propositions, Every man is a corporeal being, Every man is a living creature, Every man is rational, convey no knowledge to any one who was already aware of the entire meaning of the word _man_, for the meaning of the word includes all this: and that every _man_ has the attributes connoted by all these predicates, is already asserted when he is called a man. Now, of this nature are all the propositions which have been called essential. They are, in fact, identical propositions.

It is true that a proposition which predicates any attribute, even though it be one implied in the name, is in most cases understood to involve a tacit assertion that there _exists_ a thing corresponding to the name, and possessing the attributes connoted by it; and this implied assertion may convey information, even to those who understood the meaning of the name. But all information of this sort, conveyed by all the essential propositions of which man can be made the subject, is included in the assertion, Men exist. And

this assumption of real existence is, after all, the result of an imperfection of language. It arises from the ambiguity of the copula, which, in addition to its proper office of a mark to show that an assertion is made, is also, as formerly remarked, a concrete word connoting existence. The actual existence of the subject of the proposition is therefore only apparently, not really, implied in the predication, if an essential one: we may say, A ghost is a disembodied spirit, without believing in ghosts. But an accidental, or non-essential, affirmation, does imply the real existence of the subject, because in the case of a non-existent subject there is nothing for the proposition to assert. Such a proposition as, The ghost of a murdered person haunts the couch of the murderer, can only have a meaning if understood as implying a belief in ghosts; for since the signification of the word ghost implies nothing of the kind, the speaker either means nothing, or means to assert a thing which he wishes to be believed to have really taken place.

It will be hereafter seen that when any important consequences seem to follow, as in mathematics, from an essential proposition, or, in other words, from a proposition involved in the meaning of a name, what they really flow from is the tacit assumption of the real existence of the objects so named. Apart from this assumption of real existence, the class of propositions in which the predicate is of the essence of the subject (that is, in which the predicate connotes the whole or part of what the subject connotes, but nothing besides) answer no purpose but that of unfolding the whole or some part of the meaning of the name, to those who did not previously know it. Accordingly, the most useful, and in strictness the only useful kind of essential propositions, are Definitions: which, to be complete, should unfold the whole of what is involved in the meaning of the word defined; that is (when it is a connotative word), the whole of what it connotes. In defining a name, however, it is not usual to specify its entire connotation, but so much only as is sufficient to mark out the objects usually denoted by it from all other known objects. And sometimes a merely accidental property, not involved in the meaning of the name, answers this purpose equally well. The various kinds of definition which these distinctions give rise to, and the purposes to which they are respectively subservient, will be minutely considered in the proper place.

§ 3. According to the above view of essential propositions, no proposition can be reckoned such which relates to an individual by name, that is, in which the subject is a proper name. Individuals have no essences. When the schoolmen talked of the essence of an individual, they did not mean the properties implied in its name, for the names of individuals imply no properties. They regarded as of the essence of an individual, whatever was of the essence of the species in which they were accustomed to place that individual; _i.e._, of the class to which it was most familiarly referred, and to which, therefore, they conceived that it by nature belonged. Thus, because the proposition Man is a rational being, was an essential proposition, they affirmed the same thing of the proposition, Julius Cæsar is a rational being. This followed very naturally if genera and species were to be considered as entities, distinct from, but _inhering_ in, the individuals composing them. If _man_ was a substance inhering in each individual man, the _essence_ of man (whatever that might mean) was naturally supposed to accompany it; to inhere in John Thompson, and to form the _common essence_ of Thompson and Julius Cæsar. It might then be fairly said, that rationality, being of the essence of Man, was of the essence also of Thompson. But if Man altogether be only the individual men and a name bestowed upon them in consequence of certain common properties, what becomes of John Thompson's essence?

A fundamental error is seldom expelled from philosophy by a single victory. It retreats slowly, defends every inch of ground, and often, after it has been driven from the open country, retains a footing in some remote fastness. The essences of individuals were an unmeaning figment arising from a misapprehension of the essences of classes, yet even Locke, when he extirpated the parent error, could not shake himself free from that which was its fruit. He distinguished two sorts of essences, Real and Nominal. His nominal essences were the essences of classes, explained nearly as we have now explained them. Nor is any thing wanting to render the third book of Locke's Essay a nearly unexceptional treatise on the connotation of names, except to free its language from the assumption of what are called Abstract Ideas, which unfortunately is involved in the phraseology, though not necessarily connected with the thoughts contained in that immortal Third Book.(40) But besides nominal essences, he admitted real essences, or essences of individual objects, which he supposed to be the causes of the sensible properties of those objects. We know not (said he) what these are (and this acknowledgment rendered the fiction comparatively innocuous); but if we did, we could, from them alone, demonstrate the sensible properties of the object, as the properties of the triangle are demonstrated from the definition of the triangle. I shall have occasion to revert to this theory in treating of Demonstration, and of the conditions under which one property of a thing admits of being demonstrated from another property. It is enough here to remark that, according to this definition, the real essence of an object has, in the progress of physics, come to be conceived as nearly equivalent, in the case of bodies, to their corpuscular structure: what it is now supposed to mean in the case of any other entities, I would not take upon myself to define.

§ 4. An essential proposition, then, is one which is purely verbal; which asserts of a thing under a particular name, only what is asserted of it in the fact of calling it by that name; and which, therefore, either gives no information, or gives it respecting the name, not the thing. Non-essential, or accidental propositions, on the contrary, may be called Real Propositions, in opposition to Verbal. They predicate of a thing some fact not involved in the signification of the name by which the proposition speaks of it; some attribute not connoted by that name. Such are all propositions concerning things individually designated, and all general or particular propositions in which the predicate connotes any attribute not connoted by the subject. All these, if true, add to our knowledge: they convey information, not already involved in the names employed. When I am told that all, or even that some objects, which have certain qualities, or which stand in certain relations, have also certain other qualities, or stand in certain other relations, I learn from this proposition a new fact; a fact not included in my knowledge of the meaning of the words, nor even of the existence of Things answering to the signification of those words. It is this class of propositions only which are in themselves instructive, or from which any instructive propositions can be inferred.(41)

Nothing has probably contributed more to the opinion so long prevalent of the futility of the school logic, than the circumstance that almost all the examples used in the common school books to illustrate the doctrine of predication and that of the syllogism, consist of essential propositions. They were usually taken either from the branches or from the main trunk of the Predicamental Tree, which included nothing but what was of the _essence_ of the species: _Omne corpus est substantia_, _Omne animal est corpus_, _Omnis homo est corpus_, _Omnis homo est animal_, _Omnis homo est rationalis_, and so forth. It is far from wonderful that the syllogistic art should have been thought to be of no use in assisting correct reasoning, when almost the only propositions which, in the hands of its professed teachers, it was employed to prove, were such as every one assented to without proof the moment he comprehended the meaning of the words; and stood exactly on a level, in point of evidence, with the premises from which they were drawn. I have, therefore, throughout this work, avoided the employment of essential propositions as examples, except where the nature of the principle to be illustrated specifically required them.

§ 5. With respect to propositions which do convey information—which assert something of a Thing, under a name that does not already presuppose what is about to be asserted; there are two different aspects in which these, or rather such of them as are general propositions, may be considered: we may either look at them as portions of speculative truth, or as memoranda for practical use. According as we consider propositions in one or the other of these lights, their import may be conveniently expressed in one or in the other of two formulas.

According to the formula which we have hitherto employed, and which is best adapted to express the import of the proposition as a portion of our theoretical knowledge, All men are mortal, means that the attributes of man are always accompanied by the attribute mortality: No men are gods, means that the attributes of man are never accompanied by the attributes, or at least never by all the attributes, signified by the word god. But when the proposition is considered as a memorandum for practical use, we shall find a different mode of expressing the same meaning better adapted to indicate the office which the proposition performs. The practical use of a proposition is, to apprise or remind us what we have to expect, in any individual case which comes within the assertion contained in the proposition. In reference to this purpose, the proposition, All men are mortal, means that the attributes of man are _evidence of_, are a _mark_ of, mortality; an indication by which the presence of that attribute is made manifest. No men are gods, means that the attributes of man are a mark or evidence that some or all of the attributes understood to belong to a god are not there; that where the former are, we need not expect to find the latter.

These two forms of expression are at bottom equivalent; but the one points the attention more directly to what a proposition means, the latter to the manner in which it is to be used.

Now it is to be observed that Reasoning (the subject to which we are next to proceed) is a process into which propositions enter not as ultimate results, but as means to the establishment of other propositions. We may expect, therefore, that the mode of exhibiting the import of a general proposition which shows it in its application to practical use, will best express the function which propositions perform in Reasoning. And accordingly, in the theory of Reasoning, the mode of viewing the subject which considers a Proposition as asserting that one fact or phenomenon is a _mark_ or _evidence_ of another fact or phenomenon, will be found almost indispensable. For the purposes of that Theory, the best mode of defining the import of a proposition is not the mode which shows most clearly what it is in itself, but that which most distinctly suggests the manner in which it may be made available for advancing from it to other propositions.

Chapter VII.

Of The Nature Of Classification, And The Five Predicables.

§ 1. In examining into the nature of general propositions, we have adverted much less than is usual with logicians to the ideas of a Class, and Classification; ideas which, since the Realist doctrine of General Substances went out of vogue, have formed the basis of almost every attempt at a philosophical theory of general terms and general propositions. We have considered general names as having a meaning, quite independently of their being the names of classes. That circumstance is in truth accidental, it being wholly immaterial to the signification of the name whether there are many objects, or only one, to which it happens to be applicable, or whether there be any at all. God is as much a general term to the Christian or Jew as to the Polytheist; and dragon, hippogriff, chimera, mermaid, ghost, are as much so as if real objects existed, corresponding to those names. Every name the signification of which is constituted by attributes, is potentially a name of an indefinite number of objects; but it needs not be actually the name of any; and if of any, it may be the name of only one. As soon as we employ a name to connote attributes, the things, be they more or fewer, which happen to possess those attributes, are constituted _ipso facto_ a class. But in predicating the name we predicate only the attributes; and the fact of belonging to a class does not, in many cases, come into view at all.

Although, however, Predication does not presuppose Classification, and though the theory of Names and of Propositions is not cleared up, but only encumbered, by intruding the idea of classification into it, there is nevertheless a close connection between Classification and the employment of General Names. By every general name which we introduce, we create a class, if there be any things, real or imaginary, to compose it; that is, any Things corresponding to the signification of the name. Classes, therefore, mostly owe their existence to general language. But general language, also, though that is not the most common case, sometimes owes its existence to classes. A general, which is as much as to say a significant, name, is indeed mostly introduced because we have a signification to express by it; because we need a word by means of which to predicate the attributes which it connotes. But it is also true that a name is sometimes introduced because we have found it convenient to create a class; because we have thought it useful for the regulation of our mental operations, that a certain group of objects should be thought of together. A naturalist, for purposes connected with his particular science, sees reason to distribute the animal or vegetable creation into certain groups rather than into any others, and he requires a name to bind, as it were, each of his groups together. It must not, however, be supposed that such names, when introduced, differ in any respect, as to their mode of signification, from other connotative names. The classes which they denote are, as much as any other classes, constituted by certain common attributes, and their names are significant of those attributes, and of nothing else. The names of Cuvier's classes and orders, _Plantigrades_, _Digitigrades_, etc., are as much the expression of attributes as if those names had preceded, instead of grown out of, his classification of animals. The only peculiarity of the case is, that the convenience of classification was here the primary motive for introducing the names; while in other cases the name is introduced as a means of predication, and the formation of a class denoted by it is only an indirect consequence.

The principles which ought to regulate Classification, as a logical process subservient to the investigation of truth, can not be discussed to any purpose until a much later stage of our inquiry. But, of Classification as resulting from, and implied in, the fact of employing general language, we can not forbear to treat here, without leaving the theory of general names, and of their employment in predication, mutilated and formless.

§ 2. This portion of the theory of general language is the subject of what is termed the doctrine of the Predicables; a set of distinctions handed down from Aristotle, and his follower Porphyry, many of which have taken a firm root in scientific, and some of them even in popular, phraseology. The predicables are a fivefold division of General Names, not grounded as usual on a difference in their meaning, that is, in the attribute which they connote, but on a difference in the kind of class which they denote. We may predicate of a thing five different varieties of class-name:

A _genus_ of the thing: (γ■νος). A _species_: (ε■σος). A _differentia_: (διαφορ■). A _proprium_: (■δι■ν). An _accidens_: (συμβεβηκ■ς).

It is to be remarked of these distinctions, that they express, not what the predicate is in its own meaning, but what relation it bears to the subject of which it happens on the particular occasion to be predicated. There are not some names which are exclusively genera, and others which are exclusively species, or differentiæ; but the same name is referred to one or another predicable, according to the subject of which it is predicated on the particular occasion. _Animal_, for instance, is a genus with respect to man, or John; a species with respect to Substance, or Being. _Rectangular_ is one of the Differentiæ of a geometrical square; it is merely one of the Accidentia of the table at which I am writing. The words genus, species, etc., are therefore relative terms; they are names applied to certain predicates, to express the relation between them and some given subject: a relation grounded, as we

shall see, not on what the predicate connotes, but on the class which it denotes, and on the place which, in some given classification, that class occupies relatively to the particular subject.

§ 3. Of these five names, two, Genus and Species, are not only used by naturalists in a technical acceptation not precisely agreeing with their philosophical meaning, but have also acquired a popular acceptation, much more general than either. In this popular sense any two classes, one of which includes the whole of the other and more, may be called a Genus and a Species. Such, for instance, are Animal and Man; Man and Mathematician. Animal is a Genus; Man and Brute are its two species; or we may divide it into a greater number of species, as man, horse, dog, etc. _Biped_, or _two-footed animal_, may also be considered a genus, of which man and bird are two species. _Taste_ is a genus, of which sweet taste, sour taste, salt taste, etc., are species. _Virtue_ is a genus; justice, prudence, courage, fortitude, generosity, etc., are its species.

The same class which is a genus with reference to the sub-classes or species included in it, may be itself a species with reference to a more comprehensive, or, as it is often called, a superior genus. Man is a species with reference to animal, but a genus with reference to the species Mathematician. Animal is a genus, divided into two species, man and brute; but animal is also a species, which, with another species, vegetable, makes up the genus, organized being. Biped is a genus with reference to man and bird, but a species with respect to the superior genus, animal. Taste is a genus divided into species, but also a species of the genus sensation. Virtue, a genus with reference to justice, temperance, etc., is one of the species of the genus, mental quality.

In this popular sense the words Genus and Species have passed into common discourse. And it should be observed that in ordinary parlance, not the name of the class, but the class itself, is said to be the genus or species; not, of course, the class in the sense of each individual of the class, but the individuals collectively, considered as an aggregate whole; the name by which the class is designated being then called not the genus or species, but the generic or specific name. And this is an admissible form of expression; nor is it of any importance which of the two modes of speaking we adopt, provided the rest of our language is consistent with it; but, if we call the class itself the genus, we must not talk of predicating the genus. We predicate of man the _name_ mortal; and by predicating the name, we may be said, in an intelligible sense, to predicate what the name expresses, the _attribute_ mortality; but in no allowable sense of the word predication do we predicate of man the _class_ mortal. We predicate of him the fact of belonging to the class.

By the Aristotelian logicians, the terms genus and species were used in a more restricted sense. They did not admit every class which could be divided into other classes to be a genus, or every class which could be included in a larger class to be a species. Animal was by them considered a genus; man and brute co-ordinate species under that genus: _biped_, however, would not have been admitted to be a genus with reference to man, but a _proprium_ or _accidens_ only. It was requisite, according to their theory, that genus and species should be of the _essence_ of the subject. Animal was of the essence of man; biped was not. And in every classification they considered some one class as the lowest or _infima_ species. Man, for instance, was a lowest species. Any further divisions into which the class might be capable of being broken down, as man into white, black, and red man, or into priest and layman, they did not admit to be species.

It has been seen, however, in the preceding chapter, that the distinction between the essence of a class, and the attributes or properties which are not of its essence—a distinction which has given occasion to so much abstruse speculation, and to which so mysterious a character was formerly, and by many writers is still, attached—amounts to nothing more than the difference between those attributes of the class which are, and those which are not, involved in the signification of the class-name. As applied to individuals, the word Essence, we found, has no meaning, except in connection with the exploded tenets of the Realists; and what the schoolmen chose to call the essence of an individual, was simply the essence of the class to which that individual was most familiarly referred.

Is there no difference, then, save this merely verbal one, between the classes which the schoolmen admitted to be genera or species, and those to which they refused the title? Is it an error to regard some of the differences which exist among objects as differences _in kind_ (_genere_ or _specie_), and others only as differences in the accidents? Were the schoolmen right or wrong in giving to some of the classes into which things may be divided, the name of _kinds_, and considering others as secondary divisions, grounded on differences of a comparatively superficial nature? Examination will show that the Aristotelians did mean something by this distinction, and something important; but which, being but indistinctly conceived, was inadequately expressed by the phraseology of essences, and the various other modes of speech to which they had recourse.

§ 4. It is a fundamental principle in logic, that the power of framing classes is unlimited, as long as there is any (even the smallest) difference to found a distinction upon. Take any attribute whatever, and if some things have it, and others have not, we may ground on the attribute a division of all things into two classes; and we actually do so, the moment we create a name which connotes the attribute. The number of possible classes, therefore, is boundless; and there are as many actual classes (either of real or of imaginary things) as there are general names, positive and negative together.

But if we contemplate any one of the classes so formed, such as the class animal or plant, or the class sulphur or phosphorus, or the class white or red, and consider in what particulars the individuals included in the class differ from those which do not come within it, we find a very remarkable diversity in this respect between some classes and others. There are some classes, the things contained in which differ from other things only in certain particulars which may be numbered, while others differ in more than can be numbered, more even than we need ever expect to know. Some classes have little or nothing in common to characterize them by, except precisely what is connoted by the name: white things, for example, are not distinguished by any common properties except whiteness; or if they are, it is only by such as are in some way dependent on, or connected with, whiteness. But a hundred generations have not exhausted the common properties of animals or of plants, of sulphur or of phosphorus; nor do we suppose them to be exhaustible, but proceed to new observations and experiments, in the full confidence of discovering new properties which were by no means implied in those we previously knew. While, if any one were to propose for investigation the common properties of all things which are of the same color, the same shape, or the same specific gravity, the absurdity would be palpable. We have no ground to believe that any such common properties exist, except such as may be shown to be involved in the supposition itself, or to be derivable from it by some law of causation. It appears, therefore, that the properties, on which we ground our classes, sometimes exhaust all that the class has in common, or contain it all by some mode of implication; but in other instances we make a selection of a few properties from among not only a greater number, but a number inexhaustible by us, and to which as we know no bounds, they may, so far as we are concerned, be regarded as infinite.

There is no impropriety in saying that, of these two classifications, the one answers to a much more radical distinction in the things themselves, than the other does. And if any one even chooses to say that the one classification is made by nature, the other by us for our convenience, he will be right; provided he means no more than this: Where a certain apparent difference between things (though perhaps in itself of little moment) answers to we know not what number of other differences, pervading not only their known properties, but properties yet undiscovered, it is not optional but imperative to recognize this difference as the foundation of a specific distinction; while, on the contrary, differences that are merely finite and determinate, like those designated by the words white, black, or red, may be disregarded if the purpose for which the classification is made does not require attention to those particular properties. The differences, however, are made by nature, in both cases; while the recognition of those differences as grounds of classification and of naming, is, equally in both cases, the act of man: only in the one case, the ends of language and of classification would be subverted if no notice were taken of the difference, while in the other case, the necessity of taking notice of it depends on the importance or unimportance of the particular qualities in which the difference happens to consist.

Now, these classes, distinguished by unknown multitudes of properties, and not solely by a few determinate ones—which are parted off from one another by an unfathomable chasm, instead of a mere ordinary ditch with a visible bottom—are the only classes which, by the Aristotelian logicians, were considered as genera or species. Differences which extended only to a certain property or properties, and there terminated, they considered as differences only in the _accidents_ of things; but where any class differed from other things by an infinite series of differences, known and unknown, they considered the distinction as one of _kind_, and spoke of it as being an _essential_ difference, which is also one of the current meanings of that vague expression at the present day.

Conceiving the schoolmen to have been justified in drawing a broad line of separation between these two kinds of classes and of class-distinctions, I shall not only retain the division itself, but continue to express it in their language. According to that language, the proximate (or lowest) Kind to which any individual is referrible, is called its species. Conformably to this, Isaac Newton would be said to be of the species man. There are indeed numerous sub-classes included in the class man, to which Newton also belongs; for example, Christian, and Englishman, and Mathematician. But these, though distinct classes, are not, in our sense of the term, distinct Kinds of men. A Christian, for example, differs from other human beings; but he differs only in the attribute which the word expresses, namely, belief in Christianity, and whatever else that implies, either as involved in the fact itself, or connected with it through some law of cause and effect. We should never think of inquiring what properties, unconnected with Christianity, either as cause or effect, are common to all Christians and peculiar to them; while in regard to all Men, physiologists are perpetually carrying on such an inquiry; nor is the answer ever likely to be completed. Man, therefore, we may call a species; Christian, or Mathematician, we can not.

Note here, that it is by no means intended to imply that there may not be different Kinds, or logical species, of man. The various races and temperaments, the two sexes, and even the various ages, may be differences of kind, within our meaning of the term. I do not say that they are so. For in the progress of physiology it may almost be said to be made out, that the differences which really exist between different races, sexes, etc., follow as consequences, under laws of nature, from a small number of primary differences which can be precisely determined, and which, as the phrase is, _account for_ all the rest. If this be so, these are not distinctions in kind; no more than Christian, Jew, Mussulman, and Pagan, a difference which also carries many consequences along with it. And in this way classes are often mistaken for real Kinds, which are afterward proved not to be so. But if it turned out that the differences were not capable of being thus accounted for, then Caucasian, Mongolian, Negro, etc., would be really different Kinds of human beings, and entitled to be ranked as species by the logician; though not by the naturalist. For (as already noticed) the word species is used in a different signification in logic and in natural history. By the naturalist, organized beings are not usually said to be of different species, if it is supposed that they have descended from the same stock. That, however, is a sense artificially given to the word, for the technical purposes of a particular science. To the logician, if a negro and a white man differ in the same manner (however less in degree) as a horse and a camel do, that is, if their differences are inexhaustible, and not referrible to any common cause, they are different species, whether they are descended from common ancestors or not. But if their differences can all be traced to climate and habits, or to some one or a few special differences in structure, they are not, in the logician's view, specifically distinct.

When the _infima species_, or proximate Kind, to which an individual belongs, has been ascertained, the properties common to that Kind include necessarily the whole of the common properties of every other real Kind to which the individual can be referrible. Let the individual, for example, be Socrates, and the proximate Kind, man. Animal, or living creature, is also a real kind, and includes Socrates; but, since it likewise includes man, or in other words, since all men are animals, the properties common to animals form a portion of the common properties of the sub-class, man. And if there be any class which includes Socrates without including man, that class is not a real Kind. Let the class, for example, be _flat-nosed_; that being a class which includes Socrates, without including all men. To determine whether it is a real Kind, we must ask ourselves this question: Have all flat-nosed animals, in addition to whatever is implied in their flat noses, any common properties, other than those which are common to all animals whatever? If they had; if a flat nose were a mark or index to an indefinite number of other peculiarities, not deducible from the former by an ascertainable law, then out of the class man we might cut another class, flat-nosed man, which, according to our definition, would be a Kind. But if we could do this, man would not be, as it was assumed to be, the proximate Kind. Therefore, the properties of the proximate Kind do comprehend those (whether known or unknown) of all other Kinds to which the individual belongs; which was the point we undertook to prove. And hence, every other Kind which is predicable of the individual, will be to the proximate Kind in the relation of a genus, according to even the popular acceptation of the terms genus and species; that is, it will be a larger class, including it and more.

We are now able to fix the logical meaning of these terms. Every class which is a real Kind, that is, which is distinguished from all other classes by an indeterminate multitude of properties not derivable from one another, is either a genus or a species. A Kind which is not divisible into other Kinds, can not be a genus, because it has no species under it; but it is itself a species, both with reference to the individuals below and to the genera above (Species Prædicabilis and Species Subjicibilis). But every Kind which admits of division into real Kinds (as animal into mammal, bird, fish, etc., or bird into various species of birds) is a genus to all below it, a species to all genera in which it is itself included. And here we may close this part of the discussion, and pass to the three remaining predicables, Differentia, Proprium, and Accidens.

§ 5. To begin with Differentia. This word is correlative with the words genus and species, and as all admit, it signifies the attribute which distinguishes a given species from every other species of the same genus. This is so far clear: but we may still ask, which of the distinguishing attributes it signifies. For we have seen that every Kind (and a species must be a Kind) is distinguished from other Kinds, not by any one attribute, but by an indefinite number. Man, for instance, is a species of the genus animal: Rational (or rationality, for it is of no consequence here whether we use the concrete or the abstract form) is generally assigned by logicians as the Differentia; and doubtless this attribute serves the purpose of distinction: but it has also been remarked of man, that he is a cooking animal; the only animal that dresses its food. This, therefore, is another of the attributes by which the species man is distinguished from other species of the same genus: would this attribute serve equally well for a differentia? The Aristotelians say No; having laid it down that the differentia must, like the genus and species, be of the _essence_ of the subject.

And here we lose even that vestige of a meaning grounded in the nature of the things themselves, which may be supposed to be attached to the word essence when it is said that genus and species must be of the essence of the thing. There can be no doubt

that when the schoolmen talked of the essences of things as opposed to their accidents, they had confusedly in view the distinction between differences of kind, and the differences which are not of kind; they meant to intimate that genera and species must be Kinds. Their notion of the essence of a thing was a vague notion of a something which makes it what it is, _i.e._, which makes it the Kind of thing that it is—which causes it to have all that variety of properties which distinguish its Kind. But when the matter came to be looked at more closely, nobody could discover what caused the thing to have all those properties, nor even that there was any thing which caused it to have them. Logicians, however, not liking to admit this, and being unable to detect what made the thing to be what it was, satisfied themselves with what made it to be what it was called. Of the innumerable properties, known and unknown, that are common to the class man, a portion only, and of course a very small portion, are connoted by its name; these few, however, will naturally have been thus distinguished from the rest either for their greater obviousness, or for greater supposed importance. These properties, then, which were connoted by the name, logicians seized upon, and called them the essence of the species; and not stopping there, they affirmed them, in the case of the _infima species_, to be the essence of the individual too; for it was their maxim, that the species contained the “whole essence” of the thing. Metaphysics, that fertile field of delusion propagated by language, does not afford a more signal instance of such delusion. On this account it was that rationality, being connoted by the name man, was allowed to be a differentia of the class; but the peculiarity of cooking their food, not being connoted, was relegated to the class of accidental properties.

The distinction, therefore, between Differentia, Proprium, and Accidens, is not grounded in the nature of things, but in the connotation of names; and we must seek it there, if we wish to find what it is.

From the fact that the genus includes the species, in other words _de_notes more than the species, or is predicable of a greater number of individuals, it follows that the species must connote more than the genus. It must connote all the attributes which the genus connotes, or there would be nothing to prevent it from denoting individuals not included in the genus. And it must connote something besides, otherwise it would include the whole genus. Animal denotes all the individuals denoted by man, and many more. Man, therefore, must connote all that animal connotes, otherwise there might be men who are not animals; and it must connote something more than animal connotes, otherwise all animals would be men. This surplus of connotation—this which the species connotes over and above the connotation of the genus—is the Differentia, or specific difference; or, to state the same proposition in other words, the Differentia is that which must be added to the connotation of the genus, to complete the connotation of the species.

The word man, for instance, exclusively of what it connotes in common with animal, also connotes rationality, and at least some approximation to that external form which we all know, but which as we have no name for it considered in itself, we are content to call the human. The Differentia, or specific difference, therefore, of man, as referred to the genus animal, is that outward form and the possession of reason. The Aristotelians said, the possession of reason, without the outward form. But if they adhered to this, they would have been obliged to call the Houyhnhnms men. The question never arose, and they were never called upon to decide how such a case would have affected their notion of essentiality. However this may be, they were satisfied with taking such a portion of the differentia as sufficed to distinguish the species from all other _existing_ things, though by so doing they might not exhaust the connotation of the name.

§ 6. And here, to prevent the notion of differentia from being restricted within too narrow limits, it is necessary to remark, that a species, even as referred to the same genus, will not always have the same differentia, but a different one, according to the principle and purpose which preside over the particular classification. For example, a naturalist surveys the various kinds of animals, and looks out for the classification of them most in accordance with the order in which, for zoological purposes, he considers it desirable that we should think of them. With this view he finds it advisable that one of his fundamental divisions should be into warm-blooded and cold-blooded animals; or into animals which breathe with lungs and those which breathe with gills; or into carnivorous, and frugivorous or graminivorous; or into those which walk on the flat part and those which walk on the extremity of the foot, a distinction on which two of Cuvier’s families are founded. In doing this, the naturalist creates as many new classes; which are by no means those to which the individual animal is familiarly and spontaneously referred; nor should we ever think of assigning to them so prominent a position in our arrangement of the animal kingdom, unless for a preconceived purpose of scientific convenience. And to the liberty of doing this there is no limit. In the examples we have given, most of the classes are real Kinds, since each of the peculiarities is an index to a multitude of properties belonging to the class which it characterizes: but even if the case were otherwise—if the other properties of those classes could all be derived, by any process known to us, from the one peculiarity on which the class is founded—even then, if these derivative properties were of primary importance for the purposes of the naturalist, he would be warranted in founding his primary divisions on them.

If, however, practical convenience is a sufficient warrant for making the main demarcations in our arrangement of objects run in lines not coinciding with any distinction of Kind, and so creating genera and species in the popular sense which are not genera or species in the rigorous sense at all; _à fortiori_ must we be warranted, when our genera and species _are_ real genera and species, in marking the distinction between them by those of their properties which considerations of practical convenience most strongly recommend. If we cut a species out of a given genus—the species man, for instance, out of the genus animal—with an intention on our part that the peculiarity by which we are to be guided in the application of the name man should be rationality, then rationality is the differentia of the species man. Suppose, however, that being naturalists, we, for the purposes of our particular study, cut out of the genus animal the same species man, but with an intention that the distinction between man and all other species of animal should be, not rationality, but the possession of "four incisors in each jaw, tusks solitary, and erect posture." It is evident that the word man, when used by us as naturalists, no longer connotes rationality, but connotes the three other properties specified; for that which we have expressly in view when we impose a name, assuredly forms part of the meaning of that name. We may, therefore, lay it down as a maxim, that wherever there is a Genus, and a Species marked out from that genus by an assignable differentia, the name of the species must be connotative, and must connote the differentia; but the connotation may be special—not involved in the signification of the term as ordinarily used, but given to it when employed as a term of art or science. The word Man in common use, connotes rationality and a certain form, but does not connote the number or character of the teeth; in the Linnæan system it connotes the number of incisor and canine teeth, but does not connote rationality nor any particular form. The word _man_ has, therefore, two different meanings; though not commonly considered as ambiguous, because it happens in both cases to _de_note the same individual objects. But a case is conceivable in which the ambiguity would become evident: we have only to imagine that some new kind of animal were discovered, having Linnæus's three characteristics of humanity, but not rational, or not of the human form. In ordinary parlance, these animals would not be called men; but in natural history they must still be called so by those, if any there should be, who adhere to the Linnæan classification; and the question would arise, whether the word should continue to be used in two senses, or the classification be given up, and the technical sense of the term be abandoned along with it.

Words not otherwise connotative may, in the mode just adverted to, acquire a special or technical connotation. Thus the word whiteness, as we have so often remarked, connotes nothing; it merely denotes the attribute corresponding to a certain sensation: but if we are making a classification of colors, and desire to justify, or even merely to point out, the particular place assigned to whiteness in our arrangement, we may define it "the color produced by the mixture of all the simple rays;" and this fact, though by no means implied in the meaning of the word whiteness as ordinarily used, but only known by subsequent scientific investigation, is part of its meaning in the particular essay or treatise, and becomes the differentia of the species.(42)

The differentia, therefore, of a species may be defined to be, that part of the connotation of the specific name, whether ordinary or special and technical, which distinguishes the species in question from all other species of the genus to which on the particular occasion we are referring it.

§ 7. Having disposed of Genus, Species, and Differentia, we shall not find much difficulty in attaining a clear conception of the distinction between the other two predicables, as well as between them and the first three.

In the Aristotelian phraseology, Genus and Differentia are of the _essence_ of the subject; by which, as we have seen, is really meant that the properties signified by the genus and those signified by the differentia, form part of the connotation of the name denoting the species. Proprium and Accidens, on the other hand, form no part of the essence, but are predicated of the species only _accidentally_. Both are Accidents, in the wider sense in which the accidents of a thing are opposed to its essence; though, in the doctrine of the Predicables, Accidens is used for one sort of accident only, Proprium being another sort. Proprium, continue the schoolmen, is predicated _accidentally_, indeed, but _necessarily_; or, as they further explain it, signifies an attribute which is not indeed part of the essence, but which flows from, or is a consequence of, the essence, and is, therefore, inseparably attached to the species; _e.g._, the various properties of a triangle, which, though no part of its definition, must necessarily be possessed by whatever comes under that definition. Accidens, on the contrary, has no connection whatever with the essence, but may come and go, and the species still remain what it was before. If a species could exist without its Propria, it must be capable of existing without that on which its Propria are necessarily consequent, and therefore without its essence, without that which constitutes it a species. But an Accidens, whether separable or inseparable from the species in actual experience, may be supposed separated, without the necessity of supposing any other alteration; or at least, without supposing any of the essential properties of the species to be altered, since with them an Accidens has no connection.

A Proprium, therefore, of the species, may be defined, any attribute which belongs to all the individuals included in the species, and which, though not connoted by the specific name (either ordinarily if the classification we are considering be for ordinary purposes, or specially if it be for a special purpose), yet follows from some attribute which the name either ordinarily or specially connotes.

One attribute may follow from another in two ways; and there are consequently two kinds of Proprium. It may follow as a conclusion follows premises, or it may follow as an effect follows a cause. Thus, the attribute of having the opposite sides equal, which is not one of those connoted by the word Parallelogram, nevertheless follows from those connoted by it, namely, from having the opposite sides straight lines and parallel, and the number of sides four. The attribute, therefore, of having the opposite sides equal, is a Proprium of the class parallelogram; and a Proprium of the first kind, which follows from the connoted attributes by way of _demonstration_. The attribute of being capable of understanding language, is a Proprium of the species man, since without being connoted by the word, it follows from an attribute which the word does connote, viz., from the attribute of rationality. But this is a Proprium of the second kind, which follows by way of _causation_. How it is that one property of a thing follows, or can be inferred, from another; under what conditions this is possible, and what is the exact meaning of the phrase; are among the questions which will occupy us in the two succeeding Books. At present it needs only be said, that whether a Proprium follows by demonstration or by causation, it follows _necessarily_; that is to say, its not following would be inconsistent with some law which we regard as a part of the constitution either of our thinking faculty or of the universe.

§ 8. Under the remaining predicable, Accidens, are included all attributes of a thing which are neither involved in the signification of the name (whether ordinarily or as a term of art), nor have, so far as we know, any necessary connection with attributes which are so involved. They are commonly divided into Separable and Inseparable Accidents. Inseparable accidents are those which—although we know of no connection between them and the attributes constitutive of the species, and although, therefore, so far as we are aware, they might be absent without making the name inapplicable and the species a different species—are yet never in fact known to be absent. A concise mode of expressing the same meaning is, that inseparable accidents are properties which are universal to the species, but not necessary to it. Thus, blackness is an attribute of a crow, and, as far as we know, a universal one. But if we were to discover a race of white birds, in other respects resembling crows, we should not say, These are not crows; we should say, These are white crows. Crow, therefore, does not connote blackness; nor, from any of the attributes which it does connote, whether as a word in popular use or as a term of art, could blackness be inferred. Not only, therefore, can we conceive a white crow, but we know of no reason why such an animal should not exist. Since, however, none but black crows are known to exist, blackness, in the present state of our knowledge, ranks as an accident, but an inseparable accident, of the species crow.

Separable Accidents are those which are found, in point of fact, to be sometimes absent from the species; which are not only not necessary, but not even universal. They are such as do not belong to every individual of the species, but only to some individuals; or if to all, not at all times. Thus the color of a European is one of the separable accidents of the species man, because it is not an attribute of all human creatures. Being born, is also (speaking in the logical sense) a separable accident of the species man, because, though an attribute of all human beings, it is so only at one particular time. _A fortiori_ those attributes which are not constant even in the same individual, as, to be in one or in another place, to be hot or cold, sitting or walking, must be ranked as separable accidents.

Chapter VIII.

Of Definition.

§ 1. One necessary part of the theory of Names and of Propositions remains to be treated of in this place: the theory of Definitions. As being the most important of the class of propositions which we have characterized as purely verbal, they have already received some notice in the chapter preceding the last. But their fuller treatment was at that time postponed, because definition is so closely connected with classification, that, until the nature of the latter process is in some measure understood, the former can not be discussed to much purpose.

The simplest and most correct notion of a Definition is, a proposition declaratory of the meaning of a word; namely, either the meaning which it bears in common acceptation, or that which the speaker or writer, for the particular purposes of his discourse, intends to annex to it.

The definition of a word being the proposition which enunciates its meaning, words which have no meaning are unsusceptible of definition. Proper names, therefore, can not be defined. A proper name being a mere mark put upon an individual, and of which it is

the characteristic property to be destitute of meaning, its meaning can not of course be declared; though we may indicate by language, as we might indicate still more conveniently by pointing with the finger, upon what individual that particular mark has been, or is intended to be, put. It is no definition of “John Thomson” to say he is “the son of General Thomson;” for the name John Thomson does not express this. Neither is it any definition of “John Thomson” to say he is “the man now crossing the street.” These propositions may serve to make known who is the particular man to whom the name belongs, but that may be done still more unambiguously by pointing to him, which, however, has not been esteemed one of the modes of definition.

In the case of connotative names, the meaning, as has been so often observed, is the connotation; and the definition of a connotative name, is the proposition which declares its connotation. This might be done either directly or indirectly. The direct mode would be by a proposition in this form: “Man” (or whatsoever the word may be) “is a name connoting such and such attributes,” or “is a name which, when predicated of any thing, signifies the possession of such and such attributes by that thing.” Or thus: Man is every thing which possesses such and such attributes: Man is every thing which possesses corporeity, organization, life, rationality, and certain peculiarities of external form.

This form of definition is the most precise and least equivocal of any; but it is not brief enough, and is besides too technical for common discourse. The more usual mode of declaring the connotation of a name, is to predicate of it another name or names of known signification, which connote the same aggregation of attributes. This may be done either by predicating of the name intended to be defined, another connotative name exactly synonymous, as, “Man is a human being,” which is not commonly accounted a definition at all; or by predicating two or more connotative names, which make up among them the whole connotation of the name to be defined. In this last case, again, we may either compose our definition of as many connotative names as there are attributes, each attribute being connoted by one, as, Man is a corporeal, organized, animated, rational being, shaped so and so; or we employ names which connote several of the attributes at once, as, Man is a rational _animal_, shaped so and so.

The definition of a name, according to this view of it, is the sum total of all the _essential_ propositions which can be framed with that name for their subject. All propositions the truth of which is implied in the name, all those which we are made aware of by merely hearing the name, are included in the definition, if complete, and may be evolved from it without the aid of any other premises; whether the definition expresses them in two or three words, or in a larger number. It is, therefore, not without reason that Condillac and other writers have affirmed a definition to be an _analysis_. To resolve any complex whole into the elements of which it is compounded, is the meaning of analysis: and this we do when we replace one word which connotes a set of attributes collectively, by two or more which connote the same attributes singly, or in smaller groups.

§ 2. From this, however, the question naturally arises, in what manner are we to define a name which connotes only a single attribute: for instance, “white,” which connotes nothing but whiteness; “rational,” which connotes nothing but the possession of reason. It might seem that the meaning of such names could only be declared in two ways; by a synonymous term, if any such can be found; or in the direct way already alluded to: “White is a name connoting the attribute whiteness.” Let us see, however, whether the analysis of the meaning of the name, that is, the breaking down of that meaning into several parts, admits of being carried farther. Without at present deciding this question as to the word _white_, it is obvious that in the case of _rational_ some further explanation may be given of its meaning than is contained in the proposition, “Rational is that which possesses the attribute of reason;” since the attribute reason itself admits of being defined. And here we must turn our attention to the definitions of attributes, or rather of the names of attributes, that is, of abstract names.

In regard to such names of attributes as are connotative, and express attributes of those attributes, there is no difficulty: like other connotative names, they are defined by declaring their connotation. Thus the word _fault_ may be defined, “a quality productive of evil or inconvenience.” Sometimes, again, the attribute to be defined is not one attribute, but a union of several: we have only, therefore, to put together the names of all the attributes taken separately, and we obtain the definition of the name which belongs to them all taken together; a definition which will correspond exactly to that of the corresponding concrete name. For, as we define a concrete name by enumerating the attributes which it connotes, and as the attributes connoted by a concrete name form the entire signification of the corresponding abstract name, the same enumeration will serve for the definition of both. Thus, if the definition of a _human being_ be this, “a being, corporeal, animated, rational, shaped so and so,” the definition of _humanity_ will be corporeity and animal life, combined with rationality, and with such and such a shape.

When, on the other hand, the abstract name does not express a complication of attributes, but a single attribute, we must remember that every attribute is grounded on some fact or phenomenon, from which, and which alone, it derives its meaning. To that fact or phenomenon, called in a former chapter the foundation of the attribute, we must, therefore, have recourse for its

definition. Now, the foundation of the attribute may be a phenomenon of any degree of complexity, consisting of many different parts, either co-existent or in succession. To obtain a definition of the attribute, we must analyze the phenomenon into these parts. Eloquence, for example, is the name of one attribute only; but this attribute is grounded on external effects of a complicated nature, flowing from acts of the person to whom we ascribe the attribute; and by resolving this phenomenon of causation into its two parts, the cause and the effect, we obtain a definition of eloquence, viz. the power of influencing the feelings by speech or writing.

A name, therefore, whether concrete or abstract, admits of definition, provided we are able to analyze, that is, to distinguish into parts, the attribute or set of attributes which constitute the meaning both of the concrete name and of the corresponding abstract: if a set of attributes, by enumerating them; if a single attribute, by dissecting the fact or phenomenon (whether of perception or of internal consciousness) which is the foundation of the attribute. But, further, even when the fact is one of our simple feelings or states of consciousness, and therefore unsusceptible of analysis, the names both of the object and of the attribute still admit of definition; or rather, would do so if all our simple feelings had names. Whiteness may be defined, the property or power of exciting the sensation of white. A white object may be defined, an object which excites the sensation of white. The only names which are unsusceptible of definition, because their meaning is unsusceptible of analysis, are the names of the simple feelings themselves. These are in the same condition as proper names. They are not indeed, like proper names, unmeaning; for the words _sensation of white_ signify, that the sensation which I so denominate resembles other sensations which I remember to have had before, and to have called by that name. But as we have no words by which to recall those former sensations, except the very word which we seek to define, or some other which, being exactly synonymous with it, requires definition as much, words can not unfold the signification of this class of names; and we are obliged to make a direct appeal to the personal experience of the individual whom we address.

§ 3. Having stated what seems to be the true idea of a Definition, I proceed to examine some opinions of philosophers, and some popular conceptions on the subject, which conflict more or less with that idea.

The only adequate definition of a name is, as already remarked, one which declares the facts, and the whole of the facts, which the name involves in its signification. But with most persons the object of a definition does not embrace so much; they look for nothing more, in a definition, than a guide to the correct use of the term—a protection against applying it in a manner inconsistent with custom and convention. Any thing, therefore, is to them a sufficient definition of a term, which will serve as a correct index to what the term _de_notes; though not embracing the whole, and sometimes, perhaps, not even any part, of what it connotes. This gives rise to two sorts of imperfect, or unscientific definition; Essential but incomplete Definitions, and Accidental Definitions, or Descriptions. In the former, a connotative name is defined by a part only of its connotation; in the latter, by something which forms no part of the connotation at all.

An example of the first kind of imperfect definitions is the following: Man is a rational animal. It is impossible to consider this as a complete definition of the word Man, since (as before remarked) if we adhered to it we should be obliged to call the Houyhnhnms men; but as there happen to be no Houyhnhnms, this imperfect definition is sufficient to mark out and distinguish from all other things, the objects at present denoted by “man;” all the beings actually known to exist, of whom the name is predicable. Though the word is defined by some only among the attributes which it connotes, not by all, it happens that all known objects which possess the enumerated attributes, possess also those which are omitted; so that the field of predication which the word covers, and the employment of it which is conformable to usage, are as well indicated by the inadequate definition as by an adequate one. Such definitions, however, are always liable to be overthrown by the discovery of new objects in nature.

Definitions of this kind are what logicians have had in view, when they laid down the rule, that the definition of a species should be _per genus et differentiam_. Differentia being seldom taken to mean the whole of the peculiarities constitutive of the species, but some one of those peculiarities only, a complete definition would be _per genus et differentias_, rather than _differentiam_. It would include, with the name of the superior genus, not merely _some_ attribute which distinguishes the species intended to be defined from all other species of the same genus, but _all_ the attributes implied in the name of the species, which the name of the superior genus has not already implied. The assertion, however, that a definition must of necessity consist of a genus and differentiæ, is not tenable. It was early remarked by logicians, that the _summum genus_ in any classification, having no genus superior to itself, could not be defined in this manner. Yet we have seen that all names, except those of our elementary feelings, are susceptible of definition in the strictest sense; by setting forth in words the constituent parts of the fact or phenomenon, of which the connotation of every word is ultimately composed.

§ 4. Although the first kind of imperfect definition (which defines a connotative term by a part only of what it connotes, but a part sufficient to mark out correctly the boundaries of its denotation), has been considered by the ancients, and by logicians in general, as a complete definition; it has always been deemed necessary that the attributes employed should really form part of the connotation; for the rule was that the definition must be drawn from the _essence_ of the class; and this would not have been the case if it had been in any degree made up of attributes not connoted by the name. The second kind of imperfect definition, therefore, in which the name of a class is defined by any of its accidents—that is, by attributes which are not included in its connotation—has been rejected from the rank of genuine Definition by all logicians, and has been termed Description.

This kind of imperfect definition, however, takes its rise from the same cause as the other, namely, the willingness to accept as a definition any thing which, whether it expounds the meaning of the name or not, enables us to discriminate the things denoted by the name from all other things, and consequently to employ the term in predication without deviating from established usage. This purpose is duly answered by stating any (no matter what) of the attributes which are common to the whole of the class, and peculiar to it; or any combination of attributes which happens to be peculiar to it, though separately each of those attributes may be common to it with some other things. It is only necessary that the definition (or description) thus formed, should be _convertible_ with the name which it professes to define; that is, should be exactly co-extensive with it, being predicable of every thing of which it is predicable, and of nothing of which it is not predicable; though the attributes specified may have no connection with those which mankind had in view when they formed or recognized the class, and gave it a name. The following are correct definitions of Man, according to this test: Man is a mammiferous animal, having (by nature) two hands (for the human species answers to this description, and no other animal does): Man is an animal who cooks his food: Man is a featherless biped.

What would otherwise be a mere description, may be raised to the rank of a real definition by the peculiar purpose which the speaker or writer has in view. As was seen in the preceding chapter, it may, for the ends of a particular art or science, or for the more convenient statement of an author's particular doctrines, be advisable to give to some general name, without altering its denotation, a special connotation, different from its ordinary one. When this is done, a definition of the name by means of the attributes which make up the special connotation, though in general a mere accidental definition or description, becomes on the particular occasion and for the particular purpose a complete and genuine definition. This actually occurs with respect to one of the preceding examples, "Man is a mammiferous animal having two hands," which is the scientific definition of man, considered as one of the species in Cuvier's distribution of the animal kingdom.

In cases of this sort, though the definition is still a declaration of the meaning which in the particular instance the name is appointed to convey, it can not be said that to state the meaning of the word is the purpose of the definition. The purpose is not to expound a name, but a classification. The special meaning which Cuvier assigned to the word Man (quite foreign to its ordinary meaning, though involving no change in the denotation of the word), was incidental to a plan of arranging animals into classes on a certain principle, that is, according to a certain set of distinctions. And since the definition of Man according to the ordinary connotation of the word, though it would have answered every other purpose of a definition, would not have pointed out the place which the species ought to occupy in that particular classification; he gave the word a special connotation, that he might be able to define it by the kind of attributes on which, for reasons of scientific convenience, he had resolved to found his division of animated nature.

Scientific definitions, whether they are definitions of scientific terms, or of common terms used in a scientific sense, are almost always of the kind last spoken of: their main purpose is to serve as the landmarks of scientific classification. And since the classifications in any science are continually modified as scientific knowledge advances, the definitions in the sciences are also constantly varying. A striking instance is afforded by the words Acid and Alkali, especially the former. As experimental discovery advanced, the substances classed with acids have been constantly multiplying, and by a natural consequence the attributes connoted by the word have receded and become fewer. At first it connoted the attributes, of combining with an alkali to form a neutral substance (called a salt); being compounded of a base and oxygen; causticity to the taste and touch; fluidity, etc. The true analysis of muriatic acid, into chlorine and hydrogen, caused the second property, composition from a base and oxygen, to be excluded from the connotation. The same discovery fixed the attention of chemists upon hydrogen as an important element in acids; and more recent discoveries having led to the recognition of its presence in sulphuric, nitric, and many other acids, where its existence was not previously suspected, there is now a tendency to include the presence of this element in the connotation of the word. But carbonic acid, silica, sulphurous acid, have no hydrogen in their composition; that property can not, therefore, be connoted by the term, unless those substances are no longer to be considered acids. Causticity and fluidity have long since been excluded from the characteristics of the class, by the inclusion of silica and many other substances in it; and the formation of neutral bodies by combination with alkalis, together with such electro-chemical peculiarities as this is supposed to imply, are now

the only _differentiæ_ which form the fixed connotation of the word Acid, as a term of chemical science.

What is true of the definition of any term of science, is of course true of the definition of a science itself; and accordingly (as observed in the Introductory Chapter of this work), the definition of a science must necessarily be progressive and provisional. Any extension of knowledge or alteration in the current opinions respecting the subject-matter, may lead to a change more or less extensive in the particulars included in the science; and its composition being thus altered, it may easily happen that a different set of characteristics will be found better adapted as differentiæ for defining its name.

In the same manner in which a special or technical definition has for its object to expound the artificial classification out of which it grows; the Aristotelian logicians seem to have imagined that it was also the business of ordinary definition to expound the ordinary, and what they deemed the natural, classification of things, namely, the division of them into Kinds; and to show the place which each Kind occupies, as superior, collateral, or subordinate, among other Kinds. This notion would account for the rule that all definition must necessarily be _per genus et differentiam_, and would also explain why a single differentia was deemed sufficient. But to expound, or express in words, a distinction of Kind, has already been shown to be an impossibility: the very meaning of a Kind is, that the properties which distinguish it do not grow out of one another, and can not therefore be set forth in words, even by implication, otherwise than by enumerating them all: and all are not known, nor are ever likely to be so. It is idle, therefore, to look to this as one of the purposes of a definition: while, if it be only required that the definition of a Kind should indicate what kinds include it or are included by it, any definitions which expound the connotation of the names will do this: for the name of each class must necessarily connote enough of its properties to fix the boundaries of the class. If the definition, therefore, be a full statement of the connotation, it is all that a definition can be required to be.(43)

§ 5. Of the two incomplete and popular modes of definition, and in what they differ from the complete or philosophical mode, enough has now been said. We shall next examine an ancient doctrine, once generally prevalent and still by no means exploded, which I regard as the source of a great part of the obscurity hanging over some of the most important processes of the understanding in the pursuit of truth. According to this, the definitions of which we have now treated are only one of two sorts into which definitions may be divided, viz., definitions of names, and definitions of things. The former are intended to explain the meaning of a term; the latter, the nature of a thing; the last being incomparably the most important.

This opinion was held by the ancient philosophers, and by their followers, with the exception of the Nominalists; but as the spirit of modern metaphysics, until a recent period, has been on the whole a Nominalist spirit, the notion of definitions of things has been to a certain extent in abeyance, still continuing, however, to breed confusion in logic, by its consequences indeed rather than by itself. Yet the doctrine in its own proper form now and then breaks out, and has appeared (among other places) where it was scarcely to be expected, in a justly admired word, Archbishop Whately's _Logic_.(44) In a review of that work published by me in the _Westminster __ Review_ for January, 1828, and containing some opinions which I no longer entertain, I find the following observations on the question now before us; observations with which my present view of that question is still sufficiently in accordance.

"The distinction between nominal and real definitions, between definitions of words and what are called definitions of things, though conformable to the ideas of most of the Aristotelian logicians, can not, as it appears to us, be maintained. We apprehend that no definition is ever intended to 'explain and unfold the nature of a thing.' It is some confirmation of our opinion, that none of those writers who have thought that there were definitions of things, have ever succeeded in discovering any criterion by which the definition of a thing can be distinguished from any other proposition relating to the thing. The definition, they say, unfolds the nature of the thing: but no definition can unfold its whole nature; and every proposition in which any quality whatever is predicated of the thing, unfolds some part of its nature. The true state of the case we take to be this. All definitions are of names, and of names only; but, in some definitions, it is clearly apparent, that nothing is intended except to explain the meaning of the word; while in others, besides explaining the meaning of the word, it is intended to be implied that there exists a thing, corresponding to the word. Whether this be or be not implied in any given case, can not be collected from the mere form of the expression. 'A centaur is an animal with the upper parts of a man and the lower parts of a horse,' and 'A triangle is a rectilineal figure with three sides,' are, in form, expressions precisely similar; although in the former it is not implied that any _thing_, conformable to the term, really exists, while in the latter it is; as may be seen by substituting in both definitions, the word _means_ for _is_. In the first expression, 'A centaur means an animal,' etc., the sense would remain unchanged: in the second, 'A triangle means,' etc., the meaning would be altered, since it would be obviously impossible to deduce any of the truths of geometry from a proposition expressive only of the manner in which we intend to employ a particular sign.

“There are, therefore, expressions, commonly passing for definitions, which include in themselves more than the mere explanation of the meaning of a term. But it is not correct to call an expression of this sort a peculiar kind of definition. Its difference from the other kind consists in this, that it is not a definition, but a definition and something more. The definition above given of a triangle, obviously comprises not one, but two propositions, perfectly distinguishable. The one is, ‘There may exist a figure, bounded by three straight lines;’ the other, ‘And this figure may be termed a triangle.’ The former of these propositions is not a definition at all: the latter is a mere nominal definition, or explanation of the use and application of a term. The first is susceptible of truth or falsehood, and may therefore be made the foundation of a train of reasoning. The latter can neither be true nor false; the only character it is susceptible of is that of conformity or disconformity to the ordinary usage of language.”

There is a real distinction, then, between definitions of names, and what are erroneously called definitions of things; but it is, that the latter, along with the meaning of a name, covertly asserts a matter of fact. This covert assertion is not a definition, but a postulate. The definition is a mere identical proposition, which gives information only about the use of language, and from which no conclusions affecting matters of fact can possibly be drawn. The accompanying postulate, on the other hand, affirms a fact, which may lead to consequences of every degree of importance. It affirms the actual or possible existence of Things possessing the combination of attributes set forth in the definition; and this, if true, may be foundation sufficient on which to build a whole fabric of scientific truth.

We have already made, and shall often have to repeat, the remark, that the philosophers who overthrew Realism by no means got rid of the consequences of Realism, but retained long afterward, in their own philosophy, numerous propositions which could only have a rational meaning as part of a Realistic system. It had been handed down from Aristotle, and probably from earlier times, as an obvious truth, that the science of Geometry is deduced from definitions. This, so long as a definition was considered to be a proposition “unfolding the nature of the thing,” did well enough. But Hobbes followed, and rejected utterly the notion that a definition declares the nature of the thing, or does any thing but state the meaning of a name; yet he continued to affirm as broadly as any of his predecessors, that the ■ρχα■, _principia_, or original premises of mathematics, and even of all science, are definitions; producing the singular paradox, that systems of scientific truth, nay, all truths whatever at which we arrive by reasoning, are deduced from the arbitrary conventions of mankind concerning the signification of words.

To save the credit of the doctrine that definitions are the premises of scientific knowledge, the proviso is sometimes added, that they are so only under a certain condition, namely, that they be framed conformably to the phenomena of nature; that is, that they ascribe such meanings to terms as shall suit objects actually existing. But this is only an instance of the attempt so often made, to escape from the necessity of abandoning old language after the ideas which it expresses have been exchanged for contrary ones. From the meaning of a name (we are told) it is possible to infer physical facts, provided the name has corresponding to it an existing thing. But if this proviso be necessary, from which of the two is the inference really drawn? From the existence of a thing having the properties, or from the existence of a name meaning them?

Take, for instance, any of the definitions laid down as premises in Euclid’s Elements; the definition, let us say, of a circle. This, being analyzed, consists of two propositions; the one an assumption with respect to a matter of fact, the other a genuine definition. “A figure may exist, having all the points in the line which bounds it equally distant from a single point within it:” “Any figure possessing this property is called a circle.” Let us look at one of the demonstrations which are said to depend on this definition, and observe to which of the two propositions contained in it the demonstration really appeals. “About the centre A, describe the circle B C D.”

Here is an assumption that a figure, such as the definition expresses, _may_ be described; which is no other than the postulate, or covert assumption, involved in the so-called definition. But whether that figure be called a circle or not is quite immaterial. The purpose would be as well answered, in all respects except brevity, were we to say, “Through the point B, draw a line returning into itself, of which every point shall be at an equal distance from the point A.” By this the definition of a circle would be got rid of, and rendered needless; but not the postulate implied in it; without that the demonstration could not stand. The circle being now described, let us proceed to the consequence. “Since B C D is a circle, the radius B A is equal to the radius C A.” B A is equal to C A, not because B C D is a circle, but because B C D is a figure with the radii equal. Our warrant for assuming that such a figure about the centre A, with the radius B A, may be made to exist, is the postulate. Whether the admissibility of these postulates rests on intuition, or on proof, may be a matter of dispute; but in either case they are the premises on which the theorems depend; and while these are retained it would make no difference in the certainty of geometrical truths, though every definition in Euclid, and every technical term therein defined, were laid aside.

It is, perhaps, superfluous to dwell at so much length on what is so nearly self-evident; but when a distinction, obvious as it may appear, has been confounded, and by powerful intellects, it is better to say too much than too little for the purpose of rendering such mistakes impossible in future. I will, therefore detain the reader while I point out one of the absurd consequences flowing from the supposition that definitions, as such, are the premises in any of our reasonings, except such as relate to words only. If this supposition were true, we might argue correctly from true premises, and arrive at a false conclusion. We should only have to assume as a premise the definition of a nonentity; or rather of a name which has no entity corresponding to it. Let this, for instance, be our definition:

A dragon is a serpent breathing flame.

This proposition, considered only as a definition, is indisputably correct. A dragon _is_ a serpent breathing flame: the word _means_ that. The tacit assumption, indeed (if there were any such understood assertion), of the existence of an object with properties corresponding to the definition, would, in the present instance, be false. Out of this definition we may carve the premises of the following syllogism:

A dragon is a thing which breathes flame: A dragon is a serpent:

From which the conclusion is,

Therefore some serpent or serpents breathe flame:

an unexceptionable syllogism in the first mode of the third figure, in which both premises are true and yet the conclusion false; which every logician knows to be an absurdity. The conclusion being false and the syllogism correct, the premises can not be true. But the premises, considered as parts of a definition, are true. Therefore, the premises considered as parts of a definition can not be the real ones. The real premises must be—

A dragon is a _really existing_ thing which breathes flame: A dragon is a _really existing_ serpent:

which implied premises being false, the falsity of the conclusion presents no absurdity.

If we would determine what conclusion follows from the same ostensible premises when the tacit assumption of real existence is left out, let us, according to the recommendation in a previous page, substitute _means_ for _is_. We then have—

Dragon is _a word meaning_ a thing which breathes flame: Dragon is _a word meaning_ a serpent:

From which the conclusion is,

Some _word or words which mean_ a serpent, also mean a thing which breathes flame:

where the conclusion (as well as the premises) is true, and is the only kind of conclusion which can ever follow from a definition, namely, a proposition relating to the meaning of words.

There is still another shape into which we may transform this syllogism. We may suppose the middle term to be the designation neither of a thing nor of a name, but of an idea. We then have—

The _idea of_ a dragon is _an idea of_ a thing which breathes flame: The _idea of_ a dragon is _an idea of_ a serpent: Therefore, there is _an idea of_ a serpent, which is _an idea of_ a thing breathing flame.

Here the conclusion is true, and also the premises; but the premises are not definitions. They are propositions affirming that an idea existing in the mind, includes certain ideal elements. The truth of the conclusion follows from the existence of the psychological phenomenon called the idea of a dragon; and therefore still from the tacit assumption of a matter of fact.(45)

When, as in this last syllogism, the conclusion is a proposition respecting an idea, the assumption on which it depends may be merely that of the existence of an idea. But when the conclusion is a proposition concerning a Thing, the postulate involved in the definition which stands as the apparent premise, is the existence of a thing conformable to the definition, and not merely of an idea conformable to it. This assumption of real existence we always convey the impression that we intend to make, when we profess to

define any name which is already known to be a name of really existing objects. On this account it is, that the assumption was not necessarily implied in the definition of a dragon, while there was no doubt of its being included in the definition of a circle.

§ 6. One of the circumstances which have contributed to keep up the notion, that demonstrative truths follow from definitions rather than from the postulates implied in those definitions, is, that the postulates, even in those sciences which are considered to surpass all others in demonstrative certainty, are not always exactly true. It is not true that a circle exists, or can be described, which has all its radii _exactly_ equal. Such accuracy is ideal only; it is not found in nature, still less can it be realized by art. People had a difficulty, therefore, in conceiving that the most certain of all conclusions could rest on premises which, instead of being certainly true, are certainly not true to the full extent asserted. This apparent paradox will be examined when we come to treat of Demonstration; where we shall be able to show that as much of the postulate is true, as is required to support as much as is true of the conclusion. Philosophers, however, to whom this view had not occurred, or whom it did not satisfy, have thought it indispensable that there should be found in definitions something _more_ certain, or at least more accurately true, than the implied postulate of the real existence of a corresponding object. And this something they flattered themselves they had found, when they laid it down that a definition is a statement and analysis not of the mere meaning of a word, nor yet of the nature of a thing, but of an idea. Thus, the proposition, “A circle is a plane figure bounded by a line all the points of which are at an equal distance from a given point within it,” was considered by them, not as an assertion that any real circle has that property (which would not be exactly true), but that we _conceive_ a circle as having it; that our abstract idea of a circle is an idea of a figure with its radii exactly equal.

Conformably to this it is said, that the subject-matter of mathematics, and of every other demonstrative science, is not things as they really exist, but abstractions of the mind. A geometrical line is a line without breadth; but no such line exists in nature; it is a notion merely suggested to the mind by its experience of nature. The definition (it is said) is a definition of this mental line, not of any actual line: and it is only of the mental line, not of any line existing in nature, that the theorems of geometry are accurately true.

Allowing this doctrine respecting the nature of demonstrative truth to be correct (which, in a subsequent place, I shall endeavor to prove that it is not); even on that supposition, the conclusions which seem to follow from a definition, do not follow from the definition as such, but from an implied postulate. Even if it be true that there is no object in nature answering to the definition of a line, and that the geometrical properties of lines are not true of any lines in nature, but only of the idea of a line; the definition, at all events, postulates the real existence of such an idea: it assumes that the mind can frame, or rather has framed, the notion of length without breadth, and without any other sensible property whatever. To me, indeed, it appears that the mind can not form any such notion; it can not conceive length without breadth; it can only, in contemplating objects, attend to their length, exclusively of their other sensible qualities, and so determine what properties may be predicated of them in virtue of their length alone. If this be true, the postulate involved in the geometrical definition of a line, is the real existence, not of length without breadth, but merely of length, that is, of long objects. This is quite enough to support all the truths of geometry, since every property of a geometrical line is really a property of all physical objects in so far as possessing length. But even what I hold to be the false doctrine on the subject, leaves the conclusion that our reasonings are grounded on the matters of fact postulated in definitions, and not on the definitions themselves, entirely unaffected; and accordingly this conclusion is one which I have in common with Dr. Whewell, in his _Philosophy of the Inductive Sciences_: though, on the nature of demonstrative truth, Dr. Whewell’s opinions are greatly at variance with mine. And here, as in many other instances, I gladly acknowledge that his writings are eminently serviceable in clearing from confusion the initial steps in the analysis of the mental processes, even where his views respecting the ultimate analysis are such as (though with unfeigned respect) I can not but regard as fundamentally erroneous.

§ 7. Although, according to the opinion here presented, Definitions are properly of names only, and not of things, it does not follow from this that definitions are arbitrary. How to define a name, may not only be an inquiry of considerable difficulty and intricacy, but may involve considerations going deep into the nature of the things which are denoted by the name. Such, for instance, are the inquiries which form the subjects of the most important of Plato’s Dialogues; as, “What is rhetoric?” the topic of the Gorgias, or, “What is justice?” that of the Republic. Such, also, is the question scornfully asked by Pilate, “What is truth?” and the fundamental question with speculative moralists in all ages, “What is virtue?”

It would be a mistake to represent these difficult and noble inquiries as having nothing in view beyond ascertaining the conventional meaning of a name. They are inquiries not so much to determine what is, as what should be, the meaning of a name; which, like other practical questions of terminology, requires for its solution that we should enter, and sometimes enter very deeply, into the properties not merely of names but of the things named.

Although the meaning of every concrete general name resides in the attributes which it connotes, the objects were named before the attributes; as appears from the fact that in all languages, abstract names are mostly compounds or other derivatives of the concrete names which correspond to them. Connotative names, therefore, were, after proper names, the first which were used: and in the simpler cases, no doubt, a distinct connotation was present to the minds of those who first used the name, and was distinctly intended by them to be conveyed by it. The first person who used the word white, as applied to snow or to any other object, knew, no doubt, very well what quality he intended to predicate, and had a perfectly distinct conception in his mind of the attribute signified by the name.

But where the resemblances and differences on which our classifications are founded are not of this palpable and easily determinable kind; especially where they consist not in any one quality but in a number of qualities, the effects of which, being blended together, are not very easily discriminated, and referred each to its true source; it often happens that names are applied to namable objects, with no distinct connotation present to the minds of those who apply them. They are only influenced by a general resemblance between the new object and all or some of the old familiar objects which they have been accustomed to call by that name. This, as we have seen, is the law which even the mind of the philosopher must follow, in giving names to the simple elementary feelings of our nature: but, where the things to be named are complex wholes, a philosopher is not content with noticing a general resemblance; he examines what the resemblance consists in: and he only gives the same name to things which resemble one another in the same definite particulars. The philosopher, therefore, habitually employs his general names with a definite connotation. But language was not made, and can only in some small degree be mended, by philosophers. In the minds of the real arbiters of language, general names, especially where the classes they denote can not be brought before the tribunal of the outward senses to be identified and discriminated, connote little more than a vague gross resemblance to the things which they were earliest, or have been most, accustomed to call by those names. When, for instance, ordinary persons predicate the words _just_ or _unjust_ of any action, _noble_ or _mean_ of any sentiment, expression, or demeanor, _statesman_ or _charlatan_ of any personage figuring in politics, do they mean to affirm of those various subjects any determinate attributes, of whatever kind? No: they merely recognize, as they think, some likeness, more or less vague and loose, between these and some other things which they have been accustomed to denominate or to hear denominated by those appellations.

Language, as Sir James Mackintosh used to say of governments, “is not made, but grows.” A name is not imposed at once and by previous purpose upon a _class_ of objects, but is first applied to one thing, and then extended by a series of transitions to another and another. By this process (as has been remarked by several writers, and illustrated with great force and clearness by Dugald Stewart in his Philosophical Essays) a name not unfrequently passes by successive links of resemblance from one object to another, until it becomes applied to things having nothing in common with the first things to which the name was given; which, however, do not, for that reason, drop the name; so that it at last denotes a confused huddle of objects, having nothing whatever in common; and connotes nothing, not even a vague and general resemblance. When a name has fallen into this state, in which by predicating it of any object we assert literally nothing about the object, it has become unfit for the purposes either of thought or of the communication of thought; and can only be made serviceable by stripping it of some part of its multifarious denotation, and confining it to objects possessed of some attributes in common, which it may be made to connote. Such are the inconveniences of a language which “is not made, but grows.” Like the governments which are in a similar case, it may be compared to a road which is not made but has made itself: it requires continual mending in order to be passable.

From this it is already evident, why the question respecting the definition of an abstract name is often one of so much difficulty. The question, What is justice? is, in other words, What is the attribute which mankind mean to predicate when they call an action just? To which the first answer is, that having come to no precise agreement on the point, they do not mean to predicate distinctly any attribute at all. Nevertheless, all believe that there is some common attribute belonging to all the actions which they are in the habit of calling just. The question then must be, whether there is any such common attribute? and, in the first place, whether mankind agree sufficiently with one another as to the particular actions which they do or do not call just, to render the inquiry, what quality those actions have in common, a possible one: if so, whether the actions really have any quality in common; and if they have, what it is. Of these three, the first alone is an inquiry into usage and convention; the other two are inquiries into matters of fact. And if the second question (whether the actions form a class at all) has been answered negatively, there remains a fourth, often more arduous than all the rest, namely, how best to form a class artificially, which the name may denote.

And here it is fitting to remark, that the study of the spontaneous growth of languages is of the utmost importance to those who would logically remodel them. The classifications rudely made by established language, when retouched, as they almost all require to be, by the hands of the logician, are often themselves excellently suited to his purposes. As compared with the classifications of

a philosopher, they are like the customary law of a country, which has grown up as it were spontaneously, compared with laws methodized and digested into a code: the former are a far less perfect instrument than the latter; but being the result of a long, though unscientific, course of experience, they contain a mass of materials which may be made very usefully available in the formation of the systematic body of written law. In like manner, the established grouping of objects under a common name, even when founded only on a gross and general resemblance, is evidence, in the first place, that the resemblance is obvious, and therefore considerable; and, in the next place, that it is a resemblance which has struck great numbers of persons during a series of years and ages. Even when a name, by successive extensions, has come to be applied to things among which there does not exist this gross resemblance common to them all, still at every step in its progress we shall find such a resemblance. And these transitions of the meaning of words are often an index to real connections between the things denoted by them, which might otherwise escape the notice of thinkers; of those at least who, from using a different language, or from any difference in their habitual associations, have fixed their attention in preference on some other aspect of the things. The history of philosophy abounds in examples of such oversights, committed for want of perceiving the hidden link that connected together the seemingly disparate meanings of some ambiguous word.(46)

Whenever the inquiry into the definition of the name of any real object consists of any thing else than a mere comparison of authorities, we tacitly assume that a meaning must be found for the name, compatible with its continuing to denote, if possible all, but at any rate the greater or the more important part, of the things of which it is commonly predicated. The inquiry, therefore, into the definition, is an inquiry into the resemblances and differences among those things: whether there be any resemblance running through them all; if not, through what portion of them such a general resemblance can be traced: and finally, what are the common attributes, the possession of which gives to them all, or to that portion of them, the character of resemblance which has led to their being classed together. When these common attributes have been ascertained and specified, the name which belongs in common to the resembling objects acquires a distinct instead of a vague connotation; and by possessing this distinct connotation, becomes susceptible of definition.

In giving a distinct connotation to the general name, the philosopher will endeavor to fix upon such attributes as, while they are common to all the things usually denoted by the name, are also of greatest importance in themselves; either directly, or from the number, the conspicuousness, or the interesting character, of the consequences to which they lead. He will select, as far as possible, such _differentiæ_ as lead to the greatest number of interesting _propria_. For these, rather than the more obscure and recondite qualities on which they often depend, give that general character and aspect to a set of objects, which determine the groups into which they naturally fall. But to penetrate to the more hidden agreement on which these obvious and superficial agreements depend, is often one of the most difficult of scientific problems. As it is among the most difficult, so it seldom fails to be among the most important. And since upon the result of this inquiry respecting the causes of the properties of a class of things, there incidentally depends the question what shall be the meaning of a word; some of the most profound and most valuable investigations which philosophy presents to us, have been introduced by, and have offered themselves under the guise of, inquiries into the definition of a name.

Chapter I.

Of Inference, Or Reasoning, In General.

§ 1. In the preceding Book, we have been occupied not with the nature of Proof, but with the nature of Assertion: the import conveyed by a Proposition, whether that Proposition be true or false; not the means by which to discriminate true from false Propositions. The proper subject, however, of Logic is Proof. Before we could understand what Proof is, it was necessary to understand what that is to which proof is applicable; what that is which can be a subject of belief or disbelief, of affirmation or

denial; what, in short, the different kinds of Propositions assert.

This preliminary inquiry we have prosecuted to a definite result. Assertion, in the first place, relates either to the meaning of words, or to some property of the things which words signify. Assertions respecting the meaning of words, among which definitions are the most important, hold a place, and an indispensable one, in philosophy; but as the meaning of words is essentially arbitrary, this class of assertions are not susceptible of truth or falsity, nor therefore of proof or disproof. Assertions respecting Things, or what may be called Real Propositions, in contradistinction to verbal ones, are of various sorts. We have analyzed the import of each sort, and have ascertained the nature of the things they relate to, and the nature of what they severally assert respecting those things. We found that whatever be the form of the proposition, and whatever its nominal subject or predicate, the real subject of every proposition is some one or more facts or phenomena of consciousness, or some one or more of the hidden causes or powers to which we ascribe those facts; and that what is predicated or asserted, either in the affirmative or negative, of those phenomena or those powers, is always either Existence, Order in Place, Order in Time, Causation, or Resemblance. This, then, is the theory of the Import of Propositions, reduced to its ultimate elements: but there is another and a less abstruse expression for it, which, though stopping short in an earlier stage of the analysis, is sufficiently scientific for many of the purposes for which such a general expression is required. This expression recognizes the commonly received distinction between Subject and Attribute, and gives the following as the analysis of the meaning of propositions:—Every Proposition asserts, that some given subject does or does not possess some attribute; or that some attribute is or is not (either in all or in some portion of the subjects in which it is met with) conjoined with some other attribute.

We shall now for the present take our leave of this portion of our inquiry, and proceed to the peculiar problem of the Science of Logic, namely, how the assertions, of which we have analyzed the import, are proved or disproved; such of them, at least, as, not being amenable to direct consciousness or intuition, are appropriate subjects of proof.

We say of a fact or statement, that it is proved, when we believe its truth by reason of some other fact or statement from which it is said to _follow_. Most of the propositions, whether affirmative or negative, universal, particular, or singular, which we believe, are not believed on their own evidence, but on the ground of something previously assented to, from which they are said to be _inferred_. To infer a proposition from a previous proposition or propositions; to give credence to it, or claim credence for it, as a conclusion from something else; is to _reason_, in the most extensive sense of the term. There is a narrower sense, in which the name reasoning is confined to the form of inference which is termed ratiocination, and of which the syllogism is the general type. The reasons for not conforming to this restricted use of the term were stated in an earlier stage of our inquiry, and additional motives will be suggested by the considerations on which we are now about to enter.

§ 2. In proceeding to take into consideration the cases in which inferences can legitimately be drawn, we shall first mention some cases in which the inference is apparent, not real; and which require notice chiefly that they may not be confounded with cases of inference properly so called. This occurs when the proposition ostensibly inferred from another, appears on analysis to be merely a repetition of the same, or part of the same, assertion, which was contained in the first. All the cases mentioned in books of Logic as examples of equipollency or equivalence of propositions, are of this nature. Thus, if we were to argue, No man is incapable of reason, for every man is rational; or, All men are mortal, for no man is exempt from death; it would be plain that we were not proving the proposition, but only appealing to another mode of wording it, which may or may not be more readily comprehensible by the hearer, or better adapted to suggest the real proof, but which contains in itself no shadow of proof.

Another case is where, from a universal proposition, we affect to infer another which differs from it only in being particular: as All A is B, therefore Some A is B: No A is B, therefore Some A is not B. This, too, is not to conclude one proposition from another, but to repeat a second time something which had been asserted at first; with the difference, that we do not here repeat the whole of the previous assertion, but only an indefinite part of it.

A third case is where, the antecedent having affirmed a predicate of a given subject, the consequent affirms of the same subject something already connoted by the former predicate: as, Socrates is a man, therefore Socrates is a living creature; where all that is connoted by living creature was affirmed of Socrates when he was asserted to be a man. If the propositions are negative, we must invert their order, thus: Socrates is not a living creature, therefore he is not a man; for if we deny the less, the greater, which includes it, is already denied by implication. These, therefore, are not really cases of inference; and yet the trivial examples by which, in manuals of Logic, the rules of the syllogism are illustrated, are often of this ill-chosen kind; formal demonstrations of conclusions to which whoever understands the terms used in the statement of the data, has already, and consciously, assented.(47)

The most complex case of this sort of apparent inference is what is called the Conversion of propositions; which consists in turning the predicate into a subject, and the subject into a predicate, and framing out of the same terms thus reversed, another proposition, which must be true if the former is true. Thus, from the particular affirmative proposition, Some A is B, we may infer that Some B is A. From the universal negative, No A is B, we may conclude that No B is A. From the universal affirmative proposition, All A is B, it can not be inferred that all B is A; though all water is liquid, it is not implied that all liquid is water; but it is implied that some liquid is so; and hence the proposition, All A is B, is legitimately convertible into Some B is A. This process, which converts a universal proposition into a particular, is termed conversion _per accidens_. From the proposition, Some A is not B, we can not even infer that some B is not A; though some men are not Englishmen, it does not follow that some Englishmen are not men. The only mode usually recognized of converting a particular negative proposition, is in the form, Some A is not B, therefore something which is not B is A; and this is termed conversion by contraposition. In this case, however, the predicate and subject are not merely reversed, but one of them is changed. Instead of [A] and [B], the terms of the new proposition are [a thing which is not B], and [A]. The original proposition, Some A _is not_ B, is first changed into a proposition equipollent with it, Some A _is_ "a thing which is not B;" and the proposition, being now no longer a particular negative, but a particular affirmative, admits of conversion in the first mode, or as it is called, _simple_ conversion.(48)

In all these cases there is not really any inference; there is in the conclusion no new truth, nothing but what was already asserted in the premises, and obvious to whoever apprehends them. The fact asserted in the conclusion is either the very same fact, or part of the fact, asserted in the original proposition. This follows from our previous analysis of the Import of Propositions. When we say, for example, that some lawful sovereigns are tyrants, what is the meaning of the assertion? That the attributes connoted by the term "lawful sovereign," and the attributes connoted by the term "tyrant," sometimes co-exist in the same individual. Now this is also precisely what we mean, when we say that some tyrants are lawful sovereigns; which, therefore, is not a second proposition inferred from the first, any more than the English translation of Euclid's Elements is a collection of theorems different from and consequences of, those contained in the Greek original. Again, if we assert that no great general is a rash man, we mean that the attributes connoted by "great general," and those connoted by "rash," never co-exist in the same subject; which is also the exact meaning which would be expressed by saying, that no rash man is a great general. When we say that all quadrupeds are warm-blooded, we assert, not only that the attributes connoted by "quadruped" and those connoted by "warm-blooded" sometimes co-exist, but that the former never exist without the latter: now the proposition, Some warm-blooded creatures are quadrupeds, expresses the first half of this meaning, dropping the latter half; and therefore has been already affirmed in the antecedent proposition, All quadrupeds are warm-blooded. But that _all_ warm-blooded creatures are quadrupeds, or, in other words, that the attributes connoted by "warm-blooded" never exist without those connoted by "quadruped," has not been asserted, and can not be inferred. In order to re-assert, in an inverted form, the whole of what was affirmed in the proposition, All quadrupeds are warm-blooded, we must convert it by contraposition, thus, Nothing which is not warm-blooded is a quadruped. This proposition, and the one from which it is derived, are exactly equivalent, and either of them may be substituted for the other; for, to say that when the attributes of a quadruped are present, those of a warm-blooded creature are present, is to say that when the latter are absent the former are absent.

In a manual for young students, it would be proper to dwell at greater length on the conversion and equipollency of propositions. For though that can not be called reasoning or inference which is a mere re-assertion in different words of what had been asserted before, there is no more important intellectual habit, nor any the cultivation of which falls more strictly within the province of the art of logic, than that of discerning rapidly and surely the identity of an assertion when disguised under diversity of language. That important chapter in logical treatises which relates to the Opposition of Propositions, and the excellent technical language which logic provides for distinguishing the different kinds or modes of opposition, are of use chiefly for this purpose. Such considerations as these, that contrary propositions may both be false, but can not both be true; that subcontrary propositions may both be true, but can not both be false; that of two contradictory propositions one must be true and the other false; that of two subalternate propositions the truth of the universal proves the truth of the particular, and the falsity of the particular proves the falsity of the universal, but not _vicè versa_;(49) are apt to appear, at first sight, very technical and mysterious, but when explained, seem almost too obvious to require so formal a statement, since the same amount of explanation which is necessary to make the principles intelligible, would enable the truths which they convey to be apprehended in any particular case which can occur. In this respect, however, these axioms of logic are on a level with those of mathematics. That things which are equal to the same thing are equal to one another, is as obvious in any particular case as it is in the general statement: and if no such general maxim had ever been laid down, the demonstrations in Euclid would never have halted for any difficulty in stepping across the gap which this axiom at present serves to bridge over. Yet no one has ever censured writers on geometry, for placing a list of these elementary

generalizations at the head of their treatises, as a first exercise to the learner of the faculty which will be required in him at every step, that of apprehending a _general_ truth. And the student of logic, in the discussion even of such truths as we have cited above, acquires habits of circumspect interpretation of words, and of exactly measuring the length and breadth of his assertions, which are among the most indispensable conditions of any considerable mental attainment, and which it is one of the primary objects of logical discipline to cultivate.

§ 3. Having noticed, in order to exclude from the province of Reasoning or Inference properly so called, the cases in which the progression from one truth to another is only apparent, the logical consequent being a mere repetition of the logical antecedent; we now pass to those which are cases of inference in the proper acceptation of the term, those in which we set out from known truths, to arrive at others really distinct from them.

Reasoning, in the extended sense in which I use the term, and in which it is synonymous with Inference, is popularly said to be of two kinds: reasoning from particulars to generals, and reasoning from generals to particulars; the former being called Induction, the latter Ratiocination or Syllogism. It will presently be shown that there is a third species of reasoning, which falls under neither of these descriptions, and which, nevertheless, is not only valid, but is the foundation of both the others.

It is necessary to observe, that the expressions, reasoning from particulars to generals, and reasoning from generals to particulars, are recommended by brevity rather than by precision, and do not adequately mark, without the aid of a commentary, the distinction between Induction (in the sense now adverted to) and Ratiocination. The meaning intended by these expressions is, that Induction is inferring a proposition from propositions _less general_ than itself, and Ratiocination is inferring a proposition from propositions _equally_ or _more_ general. When, from the observation of a number of individual instances, we ascend to a general proposition, or when, by combining a number of general propositions, we conclude from them another proposition still more general, the process, which is substantially the same in both instances, is called Induction. When from a general proposition, not alone (for from a single proposition nothing can be concluded which is not involved in the terms), but by combining it with other propositions, we infer a proposition of the same degree of generality with itself, or a less general proposition, or a proposition merely individual, the process is Ratiocination. When, in short, the conclusion is more general than the largest of the premises, the argument is commonly called Induction; when less general, or equally general, it is Ratiocination.

As all experience begins with individual cases, and proceeds from them to generals, it might seem most conformable to the natural order of thought that Induction should be treated of before we touch upon Ratiocination. It will, however, be advantageous, in a science which aims at tracing our acquired knowledge to its sources, that the inquirer should commence with the latter rather than with the earlier stages of the process of constructing our knowledge; and should trace derivative truths backward to the truths from which they are deduced, and on which they depend for their evidence, before attempting to point out the original spring from which both ultimately take their rise. The advantages of this order of proceeding in the present instance will manifest themselves as we advance, in a manner superseding the necessity of any further justification or explanation.

Of Induction, therefore, we shall say no more at present, than that it at least is, without doubt, a process of real inference. The conclusion in an induction embraces more than is contained in the premises. The principle or law collected from particular instances, the general proposition in which we embody the result of our experience, covers a much larger extent of ground than the individual experiments which form its basis. A principle ascertained by experience, is more than a mere summing up of what has been specifically observed in the individual cases which have been examined; it is a generalization grounded on those cases, and expressive of our belief, that what we there found true is true in an indefinite number of cases which we have not examined, and are never likely to examine. The nature and grounds of this inference, and the conditions necessary to make it legitimate, will be the subject of discussion in the Third Book: but that such inference really takes place is not susceptible of question. In every induction we proceed from truths which we knew, to truths which we did not know; from facts certified by observation, to facts which we have not observed, and even to facts not capable of being now observed; future facts, for example; but which we do not hesitate to believe on the sole evidence of the induction itself.

Induction, then, is a real process of Reasoning or Inference. Whether, and in what sense, as much can be said of the Syllogism, remains to be determined by the examination into which we are about to enter.

Chapter II.

Of Ratiocination, Or Syllogism.

§ 1. The analysis of the Syllogism has been so accurately and fully performed in the common manuals of Logic, that in the present work, which is not designed as a manual, it is sufficient to recapitulate, _memoriæ causâ_, the leading results of that analysis, as a foundation for the remarks to be afterward made on the functions of the Syllogism, and the place which it holds in science.

To a legitimate syllogism it is essential that there should be three, and no more than three, propositions, namely, the conclusion, or proposition to be proved, and two other propositions which together prove it, and which are called the premises. It is essential that there should be three, and no more than three, terms, namely, the subject and predicate of the conclusion, and another called the middle term, which must be found in both premises, since it is by means of it that the other two terms are to be connected together. The predicate of the conclusion is called the major term of the syllogism; the subject of the conclusion is called the minor term. As there can be but three terms, the major and minor terms must each be found in one, and only one, of the premises, together with the middle term which is in them both. The premise which contains the middle term and the major term is called the major premise; that which contains the middle term and the minor term is called the minor premise.

Syllogisms are divided by some logicians into three _figures_, by others into four, according to the position of the middle term, which may either be the subject in both premises, the predicate in both, or the subject in one and the predicate in the other. The most common case is that in which the middle term is the subject of the major premise and the predicate of the minor. This is reckoned as the first figure. When the middle term is the predicate in both premises, the syllogism belongs to the second figure; when it is the subject in both, to the third. In the fourth figure the middle term is the subject of the minor premise and the predicate of the major. Those writers who reckon no more than three figures, include this case in the first.

Each figure is divided into _moods_, according to what are called the _quantity_ and _quality_ of the propositions, that is, according as they are universal or particular, affirmative or negative. The following are examples of all the legitimate moods, that is, all those in which the conclusion correctly follows from the premises. A is the minor term, C the major, B the middle term.

FIRST FIGURE.

All B is C No B is C All B is C No B is C All A is B All A is B Some A is B Some A is B therefore therefore therefore therefore All A is C No A is C Some A is C Some A is not C

SECOND FIGURE.

No C is B All C is B No C is B All C is B All A is B No A is B Some A is B Some A is not B therefore therefore therefore therefore No A is C No A is C Some A is not C Some A is not C

THIRD FIGURE.

All B is No B is C Some B is All B is Some B is No B is C C C C not C All B is All B is All B is Some B is All B is Some B is A A A A A A therefore therefore therefore therefore therefore therefore Some A is Some A is Some A is Some A is Some A is Some A is C not C C C not C not C

FOURTH FIGURE.

All C is B All C is B Some C is B No C is B No C is B All B is A No B is A All B is A All B is A Some B is A therefore therefore therefore therefore therefore Some A is C Some A is Some A is C Some A is Some A is not C not C not C

In these exemplars, or blank forms for making syllogisms, no place is assigned to _singular_ propositions; not, of course, because such propositions are not used in ratiocination, but because, their predicate being affirmed or denied of the whole of the subject, they are ranked, for the purposes of the syllogism, with universal propositions. Thus, these two syllogisms—

All men are mortal, All men are mortal, All kings are men, Socrates is a man, therefore therefore All kings are mortal, Socrates is mortal,

are arguments precisely similar, and are both ranked in the first mood of the first figure.(50)

The reasons why syllogisms in any of the above forms are legitimate, that is, why, if the premises are true, the conclusion must inevitably be so, and why this is not the case in any other possible mood (that is, in any other combination of universal and particular, affirmative and negative propositions), any person taking interest in these inquiries may be presumed to have either learned from the common-school books of the syllogistic logic, or to be capable of discovering for himself. The reader may,

however, be referred, for every needful explanation, to Archbishop Whately's _Elements of Logic_, where he will find stated with philosophical precision, and explained with remarkable perspicuity, the whole of the common doctrine of the syllogism.

All valid ratiocination; all reasoning by which, from general propositions previously admitted, other propositions equally or less general are inferred; may be exhibited in some of the above forms. The whole of Euclid, for example, might be thrown without difficulty into a series of syllogisms, regular in mood and figure.

Though a syllogism framed according to any of these formulæ is a valid argument, all correct ratiocination admits of being stated in syllogisms of the first figure alone. The rules for throwing an argument in any of the other figures into the first figure, are called rules for the _reduction_ of syllogisms. It is done by the _conversion_ of one or other, or both, of the premises. Thus an argument in the first mood of the second figure, as—

No C is B All A is B therefore No A is C,

may be reduced as follows. The proposition, No C is B, being a universal negative, admits of simple conversion, and may be changed into No B is C, which, as we showed, is the very same assertion in other words—the same fact differently expressed. This transformation having been effected, the argument assumes the following form:

No B is C All A is B therefore No A is C,

which is a good syllogism in the second mood of the first figure. Again, an argument in the first mood of the third figure must resemble the following:

All B is C All B is A therefore Some A is C,

where the minor premise, All B is A, conformably to what was laid down in the last chapter respecting universal affirmatives, does not admit of simple conversion, but may be converted _per accidens_, thus, Some A is B; which, though it does not express the whole of what is asserted in the proposition All B is A, expresses, as was formerly shown, part of it, and must therefore be true if the whole is true. We have, then, as the result of the reduction, the following syllogism in the third mood of the first figure:

All B is C Some A is B,

from which it obviously follows, that

Some A is C.

In the same manner, or in a manner on which after these examples it is not necessary to enlarge, every mood of the second, third, and fourth figures may be reduced to some one of the four moods of the first. In other words, every conclusion which can be proved in any of the last three figures, may be proved in the first figure from the same premises, with a slight alteration in the mere manner of expressing them. Every valid ratiocination, therefore, may be stated in the first figure, that is, in one of the following forms:

Every B is C No B is C All A is B, All A is B, Some A is B, Some A is B, therefore therefore All A is C. No A is C. Some A is C. Some A is not C.

Or, if more significant symbols are preferred:

To prove an affirmative, the argument must admit of being stated in this form:

All animals are mortal; All men/Some men/Socrates are animals; therefore All men/Some men/Socrates are mortal.

To prove a negative, the argument must be capable of being expressed in this form:

No one who is capable of self-control is necessarily vicious;

No one who is capable of self-control is necessarily vicious; All negroes/Some negroes/Mr. A's negro are capable of self-control; therefore No negroes are/Some negroes are not/Mr. A's negro is not necessarily vicious.

Though all ratiocination admits of being thrown into one or the other of these forms, and sometimes gains considerably by the transformation, both in clearness and in the obviousness of its consequence; there are, no doubt, cases in which the argument falls more naturally into one of the other three figures, and in which its conclusiveness is more apparent at the first glance in those

figures, than when reduced to the first. Thus, if the proposition were that pagans may be virtuous, and the evidence to prove it were the example of Aristides; a syllogism in the third figure,

Aristides was virtuous, Aristides was a pagan, therefore Some pagan was virtuous,

would be a more natural mode of stating the argument, and would carry conviction more instantly home, than the same ratiocination strained into the first figure, thus—

Aristides was virtuous, Some pagan was Aristides, therefore Some pagan was virtuous.

A German philosopher, Lambert, whose _Neues Organon_ (published in the year 1764) contains among other things one of the most elaborate and complete expositions which had ever been made of the syllogistic doctrine, has expressly examined what sort of arguments fall most naturally and suitably into each of the four figures; and his investigation is characterized by great ingenuity and clearness of thought.(51) The argument, however, is one and the same, in whichever figure it is expressed; since, as we have already seen, the premises of a syllogism in the second, third, or fourth figure, and those of the syllogism in the first figure to which it may be reduced, are the same premises in every thing except language, or, at least, as much of them as contributes to the proof of the conclusion is the same. We are therefore at liberty, in conformity with the general opinion of logicians, to consider the two elementary forms of the first figure as the universal types of all correct ratiocination; the one, when the conclusion to be proved is affirmative, the other, when it is negative; even though certain arguments may have a tendency to clothe themselves in the forms of the second, third, and fourth figures; which, however, can not possibly happen with the only class of arguments which are of first-rate scientific importance, those in which the conclusion is a universal affirmative, such conclusions being susceptible of proof in the first figure alone.(52)

§ 2. On examining, then, these two general formulæ, we find that in both of them, one premise, the major, is a universal proposition; and according as this is affirmative or negative, the conclusion is so too. All ratiocination, therefore, starts from a _general_ proposition, principle, or assumption: a proposition in which a predicate is affirmed or denied of an entire class; that is, in which some attribute, or the negation of some attribute, is asserted of an indefinite number of objects distinguished by a common characteristic, and designated, in consequence, by a common name.

The other premise is always affirmative, and asserts that something (which may be either an individual, a class, or part of a class) belongs to, or is included in, the class respecting which something was affirmed or denied in the major premise. It follows that the attribute affirmed or denied of the entire class may (if that affirmation or denial was correct) be affirmed or denied of the object or objects alleged to be included in the class: and this is precisely the assertion made in the conclusion.

Whether or not the foregoing is an adequate account of the constituent parts of the syllogism, will be presently considered; but as far as it goes it is a true account. It has accordingly been generalized, and erected into a logical maxim, on which all ratiocination is said to be founded, insomuch that to reason, and to apply the maxim, are supposed to be one and the same thing. The maxim is, That whatever can be affirmed (or denied) of a class, may be affirmed (or denied) of every thing included in the class. This axiom, supposed to be the basis of the syllogistic theory, is termed by logicians the _dictum de omni et nullo_.

This maxim, however, when considered as a principle of reasoning, appears suited to a system of metaphysics once indeed generally received, but which for the last two centuries has been considered as finally abandoned, though there have not been wanting in our own day attempts at its revival. So long as what are termed Universals were regarded as a peculiar kind of substances, having an objective existence distinct from the individual objects classed under them, the _dictum de omni_ conveyed an important meaning; because it expressed the intercommunity of nature, which it was necessary on that theory that we should suppose to exist between those general substances and the particular substances which were subordinated to them. That every thing predicable of the universal was predicable of the various individuals contained under it, was then no identical proposition, but a statement of what was conceived as a fundamental law of the universe. The assertion that the entire nature and properties of the _substantia secunda_ formed part of the nature and properties of each of the individual substances called by the same name; that the properties of Man, for example, were properties of all men; was a proposition of real significance when man did not _mean_ all men, but something inherent in men, and vastly superior to them in dignity. Now, however, when it is known that a class, a universal, a genus or species, is not an entity _per se_, but neither more nor less than the individual substances themselves which are placed in the class, and that there is nothing real in the matter except those objects, a common name given to them, and common attributes indicated by the name; what, I should be glad to know, do we learn by being told, that whatever can be affirmed of a class, may be affirmed of every object contained in the class? The class _is_ nothing but the objects contained in it: and the

dictum de omni merely amounts to the identical proposition, that whatever is true of certain objects, is true of each of those objects. If all ratiocination were no more than the application of this maxim to particular cases, the syllogism would indeed be, what it has so often been declared to be, solemn trifling. The _dictum de omni_ is on a par with another truth, which in its time was also reckoned of great importance, “Whatever is, is.” To give any real meaning to the _dictum de omni_, we must consider it not as an axiom, but as a definition; we must look upon it as intended to explain, in a circuitous and paraphrastic manner, the meaning of the word _class_.

An error which seemed finally refuted and dislodged from thought, often needs only put on a new suit of phrases, to be welcomed back to its old quarters, and allowed to repose unquestioned for another cycle of ages. Modern philosophers have not been sparing in their contempt for the scholastic dogma that genera and species are a peculiar kind of substances, which general substances being the only permanent things, while the individual substances comprehended under them are in a perpetual flux, knowledge, which necessarily imports stability, can only have relation to those general substances or universals, and not to the facts or particulars included under them. Yet, though nominally rejected, this very doctrine, whether disguised under the Abstract Ideas of Locke (whose speculations, however, it has less vitiated than those of perhaps any other writer who has been infected with it), under the ultra-nominalism of Hobbes and Condillac, or the ontology of the later German schools, has never ceased to poison philosophy. Once accustomed to consider scientific investigation as essentially consisting in the study of universals, men did not drop this habit of thought when they ceased to regard universals as possessing an independent existence: and even those who went the length of considering them as mere names, could not free themselves from the notion that the investigation of truth consisted entirely or partly in some kind of conjuration or juggle with those names. When a philosopher adopted fully the Nominalist view of the signification of general language, retaining along with it the _dictum de omni_ as the foundation of all reasoning, two such premises fairly put together were likely, if he was a consistent thinker, to land him in rather startling conclusions. Accordingly it has been seriously held, by writers of deserved celebrity, that the process of arriving at new truths by reasoning consists in the mere substitution of one set of arbitrary signs for another; a doctrine which they suppose to derive irresistible confirmation from the example of algebra. If there were any process in sorcery or necromancy more preternatural than this, I should be much surprised. The culminating point of this philosophy is the noted aphorism of Condillac, that a science is nothing, or scarcely any thing, but _une langue bien faite_; in other words, that the one sufficient rule for discovering the nature and properties of objects is to name them properly: as if the reverse were not the truth, that it is impossible to name them properly except in proportion as we are already acquainted with their nature and properties. Can it be necessary to say, that none, not even the most trivial knowledge with respect to Things, ever was or could be originally got at by any conceivable manipulation of mere names, as such; and that what can be learned from names, is only what somebody who used the names knew before? Philosophical analysis confirms the indication of common sense, that the function of names is but that of enabling us to _remember_ and to _communicate_ our thoughts. That they also strengthen, even to an incalculable extent, the power of thought itself, is most true: but they do this by no intrinsic and peculiar virtue; they do it by the power inherent in an artificial memory, an instrument of which few have adequately considered the immense potency. As an artificial memory, language truly is, what it has so often been called, an instrument of thought; but it is one thing to be the instrument, and another to be the exclusive subject upon which the instrument is exercised. We think, indeed, to a considerable extent, by means of names, but what we think of, are the things called by those names; and there can not be a greater error than to imagine that thought can be carried on with nothing in our mind but names, or that we can make the names think for us.

§ 3. Those who considered the _dictum de omni_ as the foundation of the syllogism, looked upon arguments in a manner corresponding to the erroneous view which Hobbes took of propositions. Because there are some propositions which are merely verbal, Hobbes, in order apparently that his definition might be rigorously universal, defined a proposition as if no propositions declared any thing except the meaning of words. If Hobbes was right; if no further account than this could be given of the import of propositions; no theory could be given but the commonly received one, of the combination of propositions in a syllogism. If the minor premise asserted nothing more than that something belongs to a class, and if the major premise asserted nothing of that class except that it is included in another class, the conclusion would only be that what was included in the lower class is included in the higher, and the result, therefore, nothing except that the classification is consistent with itself. But we have seen that it is no sufficient account of the meaning of a proposition, to say that it refers something to, or excludes something from, a class. Every proposition which conveys real information asserts a matter of fact, dependent on the laws of nature, and not on classification. It asserts that a given object does or does not possess a given attribute; or it asserts that two attributes, or sets of attributes, do or do not (constantly or occasionally) co-exist. Since such is the purport of all propositions which convey any real knowledge, and since ratiocination is a mode of acquiring real knowledge, any theory of ratiocination which does not recognize this import of propositions,

can not, we may be sure, be the true one.

Applying this view of propositions to the two premises of a syllogism, we obtain the following results. The major premise, which, as already remarked, is always universal, asserts, that all things which have a certain attribute (or attributes) have or have not along with it, a certain other attribute (or attributes). The minor premise asserts that the thing or set of things which are the subject of that premise, have the first-mentioned attribute; and the conclusion is, that they have (or that they have not), the second. Thus in our former example,

All men are mortal, Socrates is a man, therefore Socrates is mortal,

the subject and predicate of the major premise are connotative terms, denoting objects and connoting attributes. The assertion in the major premise is, that along with one of the two sets of attributes, we always find the other: that the attributes connoted by "man" never exist unless conjoined with the attribute called mortality. The assertion in the minor premise is that the individual named Socrates possesses the former attributes; and it is concluded that he possesses also the attribute mortality. Or, if both the premises are general propositions, as

All men are mortal, All kings are men, therefore All kings are mortal,

the minor premise asserts that the attributes denoted by kingship only exist in conjunction with those signified by the word man. The major asserts as before, that the last-mentioned attributes are never found without the attribute of mortality. The conclusion is, that wherever the attributes of kingship are found, that of mortality is found also.

If the major premise were negative, as, No men are omnipotent, it would assert, not that the attributes connoted by "man" never exist without, but that they never exist with, those connoted by "omnipotent:" from which, together with the minor premise, it is concluded, that the same incompatibility exists between the attribute omnipotence and those constituting a king. In a similar manner we might analyze any other example of the syllogism.

If we generalize this process, and look out for the principle or law involved in every such inference, and presupposed in every syllogism, the propositions of which are any thing more than merely verbal; we find, not the unmeaning _dictum de omni et nullo_, but a fundamental principle, or rather two principles, strikingly resembling the axioms of mathematics. The first, which is the principle of affirmative syllogisms, is, that things which co-exist with the same thing, co-exist with one another: or (still more precisely) a thing which co-exists with another thing, which other co-exists with a third thing, also co-exists with that third thing. The second is the principle of negative syllogisms, and is to this effect: that a thing which co-exists with another thing, with which other a third thing does not co-exist, is not co-existent with that third thing. These axioms manifestly relate to facts, and not to conventions; and one or other of them is the ground of the legitimacy of every argument in which facts and not conventions are the matter treated of.(53)

§ 4. It remains to translate this exposition of the syllogism from the one into the other of the two languages in which we formerly remarked(54) that all propositions, and of course therefore all combinations of propositions, might be expressed. We observed that a proposition might be considered in two different lights; as a portion of our knowledge of nature, or as a memorandum for our guidance. Under the former, or speculative aspect, an affirmative general proposition is an assertion of a speculative truth, viz., that whatever has a certain attribute has a certain other attribute. Under the other aspect, it is to be regarded not as a part of our knowledge, but as an aid for our practical exigencies, by enabling us, when we see or learn that an object possesses one of the two attributes, to infer that it possesses the other; thus employing the first attribute as a mark or evidence of the second. Thus regarded, every syllogism comes within the following general formula:

Attribute A is a mark of attribute B, The given object has the mark A, therefore The given object has the attribute B.

Referred to this type, the arguments which we have lately cited as specimens of the syllogism, will express themselves in the following manner:

The attributes of man are a mark of the attribute mortality, Socrates has the attributes of man, therefore Socrates has the attribute mortality.

And again,

The attributes of man are a mark of the attribute mortality, The attributes of a king are a mark of the attributes of man, therefore The attributes of a king are a mark of the attribute mortality.

And, lastly,

The attributes of man are a mark of the absence of the attribute omnipotence, The attributes of a king are a mark of the attributes of man, therefore The attributes of a king are a mark of the absence of the attribute signified by the word omnipotent (or, are evidence of the absence of that attribute).

To correspond with this alteration in the form of the syllogisms, the axioms on which the syllogistic process is founded must undergo a corresponding transformation. In this altered phraseology, both those axioms may be brought under one general expression; namely, that whatever has any mark, has that which it is a mark of. Or, when the minor premise as well as the major is universal, we may state it thus: Whatever is a mark of any mark, is a mark of that which this last is a mark of. To trace the identity of these axioms with those previously laid down, may be left to the intelligent reader. We shall find, as we proceed, the great convenience of the phraseology into which we have last thrown them, and which is better adapted than any I am acquainted with, to express with precision and force what is aimed at, and actually accomplished, in every case of the ascertainment of a truth by ratiocination.(55)

Chapter III.

Of The Functions And Logical Value Of The Syllogism.

§ 1. We have shown what is the real nature of the truths with which the Syllogism is conversant, in contradistinction to the more superficial manner in which their import is conceived in the common theory; and what are the fundamental axioms on which its probative force or conclusiveness depends. We have now to inquire, whether the syllogistic process, that of reasoning from generals to particulars, is, or is not, a process of inference; a progress from the known to the unknown: a means of coming to a knowledge of something which we did not know before.

Logicians have been remarkably unanimous in their mode of answering this question. It is universally allowed that a syllogism is vicious if there be any thing more in the conclusion than was assumed in the premises. But this is, in fact, to say, that nothing ever was, or can be, proved by syllogism, which was not known, or assumed to be known, before. Is ratiocination, then, not a process of inference? And is the syllogism, to which the word reasoning has so often been represented to be exclusively appropriate, not really entitled to be called reasoning at all? This seems an inevitable consequence of the doctrine, admitted by all writers on the subject, that a syllogism can prove no more than is involved in the premises. Yet the acknowledgment so explicitly made, has not prevented one set of writers from continuing to represent the syllogism as the correct analysis of what the mind actually performs in discovering and proving the larger half of the truths, whether of science or of daily life, which we believe; while those who have avoided this inconsistency, and followed out the general theorem respecting the logical value of the syllogism to its legitimate corollary, have been led to impute uselessness and frivolity to the syllogistic theory itself, on the ground of the _petitio principii_ which they allege to be inherent in every syllogism. As I believe both these opinions to be fundamentally erroneous, I must request the attention of the reader to certain considerations, without which any just appreciation of the true character of the syllogism, and the functions it performs in philosophy, appears to me impossible; but which seem to have been either overlooked, or insufficiently adverted to, both by the defenders of the syllogistic theory and by its assailants.

§ 2. It must be granted that in every syllogism, considered as an argument to prove the conclusion, there is a _petitio principii_. When we say,

All men are mortal, Socrates is a man, therefore Socrates is mortal;

it is unanswerably urged by the adversaries of the syllogistic theory, that the proposition, Socrates is mortal, is presupposed in the more general assumption, All men are mortal: that we can not be assured of the mortality of all men, unless we are already certain of the mortality of every individual man: that if it be still doubtful whether Socrates, or any other individual we choose to name, be mortal or not, the same degree of uncertainty must hang over the assertion, All men are mortal: that the general principle, instead of being given as evidence of the particular case, can not itself be taken for true without exception, until every shadow of doubt which could affect any case comprised with it, is dispelled by evidence _aliundè_; and then what remains for the syllogism to prove? That, in short, no reasoning from generals to particulars can, as such, prove any thing: since from a general principle we

can not infer any particulars, but those which the principle itself assumes as known.

This doctrine appears to me irrefragable; and if logicians, though unable to dispute it, have usually exhibited a strong disposition to explain it away, this was not because they could discover any flaw in the argument itself, but because the contrary opinion seemed to rest on arguments equally indisputable. In the syllogism last referred to, for example, or in any of those which we previously constructed, is it not evident that the conclusion may, to the person to whom the syllogism is presented, be actually and _bona fide_ a new truth? Is it not matter of daily experience that truths previously unthought of, facts which have not been, and can not be, directly observed, are arrived at by way of general reasoning? We believe that the Duke of Wellington is mortal. We do not know this by direct observation, so long as he is not yet dead. If we were asked how, this being the case, we know the duke to be mortal, we should probably answer, Because all men are so. Here, therefore, we arrive at the knowledge of a truth not (as yet) susceptible of observation, by a reasoning which admits of being exhibited in the following syllogism:

All men are mortal, The Duke of Wellington is a man, therefore The Duke of Wellington is mortal.

And since a large portion of our knowledge is thus acquired, logicians have persisted in representing the syllogism as a process of inference or proof; though none of them has cleared up the difficulty which arises from the inconsistency between that assertion, and the principle, that if there be any thing in the conclusion which was not already asserted in the premises, the argument is vicious. For it is impossible to attach any serious scientific value to such a mere salvo, as the distinction drawn between being involved _by implication_ in the premises, and being directly asserted in them. When Archbishop Whately says(56) that the object of reasoning is “merely to expand and unfold the assertions wrapped up, as it were, and implied in those with which we set out, and to bring a person to perceive and acknowledge the full force of that which he has admitted,” he does not, I think, meet the real difficulty requiring to be explained, namely, how it happens that a science, like geometry, _can_ be all “wrapped up” in a few definitions and axioms. Nor does this defense of the syllogism differ much from what its assailants urge against it as an accusation, when they charge it with being of no use except to those who seek to press the consequences of an admission into which a person has been entrapped without having considered and understood its full force. When you admitted the major premise, you asserted the conclusion; but, says Archbishop Whately, you asserted it by implication merely: this, however, can here only mean that you asserted it unconsciously; that you did not know you were asserting it; but, if so, the difficulty revives in this shape—Ought you not to have known? Were you warranted in asserting the general proposition without having satisfied yourself of the truth of every thing which it fairly includes? And if not, is not the syllogistic art _prima facie_ what its assailants affirm it to be, a contrivance for catching you in a trap, and holding you fast in it?(57)

§ 3. From this difficulty there appears to be but one issue. The proposition that the Duke of Wellington is mortal, is evidently an inference; it is got at as a conclusion from something else; but do we, in reality, conclude it from the proposition, All men are mortal? I answer, no.

The error committed is, I conceive, that of overlooking the distinction between two parts of the process of philosophizing, the inferring part, and the registering part; and ascribing to the latter the functions of the former. The mistake is that of referring a person to his own notes for the origin of his knowledge. If a person is asked a question, and is at the moment unable to answer it, he may refresh his memory by turning to a memorandum which he carries about with him. But if he were asked, how the fact came to his knowledge, he would scarcely answer, because it was set down in his note-book: unless the book was written, like the Koran, with a quill from the wing of the angel Gabriel.

Assuming that the proposition, The Duke of Wellington is mortal, is immediately an inference from the proposition, All men are mortal; whence do we derive our knowledge of that general truth? Of course from observation. Now, all which man can observe are individual cases. From these all general truths must be drawn, and into these they may be again resolved; for a general truth is but an aggregate of particular truths; a comprehensive expression, by which an indefinite number of individual facts are affirmed or denied at once. But a general proposition is not merely a compendious form for recording and preserving in the memory a number of particular facts, all of which have been observed. Generalization is not a process of mere naming, it is also a process of inference. From instances which we have observed, we feel warranted in concluding, that what we found true in those instances, holds in all similar ones, past, present, and future, however numerous they may be. We then, by that valuable contrivance of language which enables us to speak of many as if they were one, record all that we have observed, together with all that we infer from our observations, in one concise expression; and have thus only one proposition, instead of an endless number, to remember or to communicate. The results of many observations and inferences, and instructions for making innumerable inferences in unforeseen cases, are compressed into one short sentence.

When, therefore, we conclude from the death of John and Thomas, and every other person we ever heard of in whose case the experiment had been fairly tried, that the Duke of Wellington is mortal like the rest; we may, indeed, pass through the generalization, All men are mortal, as an intermediate stage; but it is not in the latter half of the process, the descent from all men to the Duke of Wellington, that the _inference_ resides. The inference is finished when we have asserted that all men are mortal. What remains to be performed afterward is merely deciphering our own notes.

Archbishop Whately has contended that syllogizing, or reasoning from generals to particulars, is not, agreeably to the vulgar idea, a peculiar _mode_ of reasoning, but the philosophical analysis of _the_ mode in which all men reason, and must do so if they reason at all. With the deference due to so high an authority, I can not help thinking that the vulgar notion is, in this case, the more correct. If, from our experience of John, Thomas, etc., who once were living, but are now dead, we are entitled to conclude that all human beings are mortal, we might surely without any logical inconsequence have concluded at once from those instances, that the Duke of Wellington is mortal. The mortality of John, Thomas, and others is, after all, the whole evidence we have for the mortality of the Duke of Wellington. Not one iota is added to the proof by interpolating a general proposition. Since the individual cases are all the evidence we can possess, evidence which no logical form into which we choose to throw it can make greater than it is; and since that evidence is either sufficient in itself, or, if insufficient for the one purpose, can not be sufficient for the other; I am unable to see why we should be forbidden to take the shortest cut from these sufficient premises to the conclusion, and constrained to travel the "high priori road," by the arbitrary fiat of logicians. I can not perceive why it should be impossible to journey from one place to another unless we "march up a hill, and then march down again." It may be the safest road, and there may be a resting-place at the top of the hill, affording a commanding view of the surrounding country; but for the mere purpose of arriving at our journey's end, our taking that road is perfectly optional; it is a question of time, trouble, and danger.

Not only _may_ we reason from particulars to particulars without passing through generals, but we perpetually do so reason. All our earliest inferences are of this nature. From the first dawn of intelligence we draw inferences, but years elapse before we learn the use of general language. The child, who, having burned his fingers, avoids to thrust them again into the fire, has reasoned or inferred, though he has never thought of the general maxim, Fire burns. He knows from memory that he has been burned, and on this evidence believes, when he sees a candle, that if he puts his finger into the flame of it, he will be burned again. He believes this in every case which happens to arise; but without looking, in each instance, beyond the present case. He is not generalizing; he is inferring a particular from particulars. In the same way, also, brutes reason. There is no ground for attributing to any of the lower animals the use of signs, of such a nature as to render general propositions possible. But those animals profit by experience, and avoid what they have found to cause them pain, in the same manner, though not always with the same skill, as a human creature. Not only the burned child, but the burned dog, dreads the fire.

I believe that, in point of fact, when drawing inferences from our personal experience, and not from maxims handed down to us by books or tradition, we much oftener conclude from particulars to particulars directly, than through the intermediate agency of any general proposition. We are constantly reasoning from ourselves to other people, or from one person to another, without giving ourselves the trouble to erect our observations into general maxims of human or external nature. When we conclude that some person will, on some given occasion, feel or act so and so, we sometimes judge from an enlarged consideration of the manner in which human beings in general, or persons of some particular character, are accustomed to feel and act; but much oftener from merely recollecting the feelings and conduct of the same person in some previous instance, or from considering how we should feel or act ourselves. It is not only the village matron, who, when called to a consultation upon the case of a neighbor's child, pronounces on the evil and its remedy simply on the recollection and authority of what she accounts the similar case of her Lucy. We all, where we have no definite maxims to steer by, guide ourselves in the same way: and if we have an extensive experience, and retain its impressions strongly, we may acquire in this manner a very considerable power of accurate judgment, which we may be utterly incapable of justifying or of communicating to others. Among the higher order of practical intellects there have been many of whom it was remarked how admirably they suited their means to their ends, without being able to give any sufficient reasons for what they did; and applied, or seemed to apply, recondite principles which they were wholly unable to state. This is a natural consequence of having a mind stored with appropriate particulars, and having been long accustomed to reason at once from these to fresh particulars, without practicing the habit of stating to one's self or to others the corresponding general propositions. An old warrior, on a rapid glance at the outlines of the ground, is able at once to give the necessary orders for a skillful arrangement of his troops; though if he has received little theoretical instruction, and has seldom been called upon to answer to other people for his conduct, he may never have had in his mind a single general theorem respecting the relation between ground and array. But his experience of encampments, in circumstances more or less similar, has left a number of vivid, unexpressed, ungeneralized

analogies in his mind, the most appropriate of which, instantly suggesting itself, determines him to a judicious arrangement.

The skill of an uneducated person in the use of weapons, or of tools, is of a precisely similar nature. The savage who executes unerringly the exact throw which brings down his game, or his enemy, in the manner most suited to his purpose, under the operation of all the conditions necessarily involved, the weight and form of the weapon, the direction and distance of the object, the action of the wind, etc., owes this power to a long series of previous experiments, the results of which he certainly never framed into any verbal theorems or rules. The same thing may generally be said of any other extraordinary manual dexterity. Not long ago a Scotch manufacturer procured from England, at a high rate of wages, a working dyer, famous for producing very fine colors, with the view of teaching to his other workmen the same skill. The workman came; but his mode of proportioning the ingredients, in which lay the secret of the effects he produced, was by taking them up in handfuls, while the common method was to weigh them. The manufacturer sought to make him turn his handling system into an equivalent weighing system, that the general principle of his peculiar mode of proceeding might be ascertained. This, however, the man found himself quite unable to do, and therefore could impart his skill to nobody. He had, from the individual cases of his own experience, established a connection in his mind between fine effects of color, and tactual perceptions in handling his dyeing materials; and from these perceptions he could, in any particular case, infer the means to be employed, and the effects which would be produced, but could not put others in possession of the grounds on which he proceeded, from having never generalized them in his own mind, or expressed them in language.

Almost every one knows Lord Mansfield's advice to a man of practical good sense, who, being appointed governor of a colony, had to preside in its courts of justice, without previous judicial practice or legal education. The advice was to give his decision boldly, for it would probably be right; but never to venture on assigning reasons, for they would almost infallibly be wrong. In cases like this, which are of no uncommon occurrence, it would be absurd to suppose that the bad reason was the source of the good decision. Lord Mansfield knew that if any reason were assigned it would be necessarily an afterthought, the judge being _in fact_ guided by impressions from past experience, without the circuitous process of framing general principles from them, and that if he attempted to frame any such he would assuredly fail. Lord Mansfield, however, would not have doubted that a man of equal experience who had also a mind stored with general propositions derived by legitimate induction from that experience, would have been greatly preferable as a judge, to one, however sagacious, who could not be trusted with the explanation and justification of his own judgments. The cases of men of talent performing wonderful things they know not how, are examples of the rudest and most spontaneous form of the operations of superior minds. It is a defect in them, and often a source of errors, not to have generalized as they went on; but generalization, though a help, the most important indeed of all helps, is not an essential.

Even the scientifically instructed, who possess, in the form of general propositions, a systematic record of the results of the experience of mankind, need not always revert to those general propositions in order to apply that experience to a new case. It is justly remarked by Dugald Stewart, that though the reasonings in mathematics depend entirely on the axioms, it is by no means necessary to our seeing the conclusiveness of the proof, that the axioms should be expressly adverted to. When it is inferred that AB is equal to CD because each of them is equal to EF, the most uncultivated understanding, as soon as the propositions were understood, would assent to the inference, without having ever heard of the general truth that "things which are equal to the same thing are equal to one another." This remark of Stewart, consistently followed out, goes to the root, as I conceive, of the philosophy of ratiocination; and it is to be regretted that he himself stopped short at a much more limited application of it. He saw that the general propositions on which a reasoning is said to depend, may, in certain cases, be altogether omitted, without impairing its probative force. But he imagined this to be a peculiarity belonging to axioms; and argued from it, that axioms are not the foundations or first principles of geometry, from which all the other truths of the science are synthetically deduced (as the laws of motion and of the composition of forces in dynamics, the equal mobility of fluids in hydrostatics, the laws of reflection and refraction in optics, are the first principles of those sciences); but are merely necessary assumptions, self-evident indeed, and the denial of which would annihilate all demonstration, but from which, as premises, nothing can be demonstrated. In the present, as in many other instances, this thoughtful and elegant writer has perceived an important truth, but only by halves. Finding, in the case of geometrical axioms, that general names have not any talismanic virtue for conjuring new truths out of the well where they lie hid, and not seeing that this is equally true in every other case of generalization, he contended that axioms are in their nature barren of consequences, and that the really fruitful truths, the real first principles of geometry, are the definitions; that the definition, for example, of the circle is to the properties of the circle, what the laws of equilibrium and of the pressure of the atmosphere are to the rise of the mercury in the Torricellian tube. Yet all that he had asserted respecting the function to which the axioms are confined in the demonstrations of geometry, holds equally true of the definitions. Every demonstration in Euclid might be carried on without them. This is apparent from the ordinary process of proving a proposition of geometry by means of a diagram. What assumption, in fact, do we set out from, to demonstrate by a diagram any of the properties of the circle? Not that in all circles the radii are equal,

but only that they are so in the circle ABC. As our warrant for assuming this, we appeal, it is true, to the definition of a circle in general; but it is only necessary that the assumption be granted in the case of the particular circle supposed. From this, which is not a general but a singular proposition, combined with other propositions of a similar kind, some of which _when generalized_ are called definitions, and other axioms, we prove that a certain conclusion is true, not of all circles, but of the particular circle ABC; or at least would be so, if the facts precisely accorded with our assumptions. The enunciation, as it is called, that is, the general theorem which stands at the head of the demonstration, is not the proposition actually demonstrated. One instance only is demonstrated: but the process by which this is done, is a process which, when we consider its nature, we perceive might be exactly copied in an indefinite number of other instances; in every instance which conforms to certain conditions. The contrivance of general language furnishing us with terms which connote these conditions, we are able to assert this indefinite multitude of truths in a single expression, and this expression is the general theorem. By dropping the use of diagrams, and substituting, in the demonstrations, general phrases for the letters of the alphabet, we might prove the general theorem directly, that is, we might demonstrate all the cases at once; and to do this we must, of course, employ as our premises, the axioms and definitions in their general form. But this only means, that if we can prove an individual conclusion by assuming an individual fact, then in whatever case we are warranted in making an exactly similar assumption, we may draw an exactly similar conclusion. The definition is a sort of notice to ourselves and others, what assumptions we think ourselves entitled to make. And so in all cases, the general propositions, whether called definitions, axioms, or laws of nature, which we lay down at the beginning of our reasonings, are merely abridged statements, in a kind of short-hand, of the particular facts, which, as occasion arises, we either think we may proceed on as proved, or intend to assume. In any one demonstration it is enough if we assume for a particular case suitably selected, what by the statement of the definition or principle we announce that we intend to assume in all cases which may arise. The definition of the circle, therefore, is to one of Euclid’s demonstrations, exactly what, according to Stewart, the axioms are; that is, the demonstration does not depend on it, but yet if we deny it the demonstration fails. The proof does not rest on the general assumption, but on a similar assumption confined to the particular case: that case, however, being chosen as a specimen or paradigm of the whole class of cases included in the theorem, there can be no ground for making the assumption in that case which does not exist in every other; and to deny the assumption as a general truth, is to deny the right of making it in the particular instance.

There are, undoubtedly, the most ample reasons for stating both the principles and the theorems in their general form, and these will be explained presently, so far as explanation is requisite. But, that unpracticed learners, even in making use of one theorem to demonstrate another, reason rather from particular to particular than from the general proposition, is manifest from the difficulty they find in applying a theorem to a case in which the configuration of the diagram is extremely unlike that of the diagram by which the original theorem was demonstrated. A difficulty which, except in cases of unusual mental power, long practice can alone remove, and removes chiefly by rendering us familiar with all the configurations consistent with the general conditions of the theorem.

§ 4. From the considerations now adduced, the following conclusions seem to be established. All inference is from particulars to particulars: General propositions are merely registers of such inferences already made, and short formulæ for making more: The major premise of a syllogism, consequently, is a formula of this description: and the conclusion is not an inference drawn _from_ the formula, but an inference drawn _according_ to the formula: the real logical antecedent, or premise, being the particular facts from which the general proposition was collected by induction. Those facts, and the individual instances which supplied them, may have been forgotten: but a record remains, not indeed descriptive of the facts themselves, but showing how those cases may be distinguished, respecting which, the facts, when known, were considered to warrant a given inference. According to the indications of this record we draw our conclusion: which is, to all intents and purposes, a conclusion from the forgotten facts. For this it is essential that we should read the record correctly: and the rules of the syllogism are a set of precautions to insure our doing so.

This view of the functions of the syllogism is confirmed by the consideration of precisely those cases which might be expected to be least favorable to it, namely, those in which ratiocination is independent of any previous induction. We have already observed that the syllogism, in the ordinary course of our reasoning, is only the latter half of the process of traveling from premises to a conclusion. There are, however, some peculiar cases in which it is the whole process. Particulars alone are capable of being subjected to observation; and all knowledge which is derived from observation, begins, therefore, of necessity, in particulars; but our knowledge may, in cases of certain descriptions, be conceived as coming to us from other sources than observation. It may present itself as coming from testimony, which, on the occasion and for the purpose in hand, is accepted as of an authoritative character: and the information thus communicated, may be conceived to comprise not only particular facts but general propositions, as when a scientific doctrine is accepted without examination on the authority of writers, or a theological doctrine on that of

Scripture. Or the generalization may not be, in the ordinary sense, an assertion at all, but a command; a law, not in the philosophical, but in the moral and political sense of the term: an expression of the desire of a superior, that we, or any number of other persons, shall conform our conduct to certain general instructions. So far as this asserts a fact, namely, a volition of the legislator, that fact is an individual fact, and the proposition, therefore, is not a general proposition. But the description therein contained of the conduct which it is the will of the legislator that his subjects should observe, is general. The proposition asserts, not that all men _are_ any thing, but that all men _shall_ do something.

In both these cases the generalities are the original data, and the particulars are elicited from them by a process which correctly resolves itself into a series of syllogisms. The real nature, however, of the supposed deductive process, is evident enough. The only point to be determined is, whether the authority which declared the general proposition, intended to include this case in it; and whether the legislator intended his command to apply to the present case among others, or not. This is ascertained by examining whether the case possesses the marks by which, as those authorities have signified, the cases which they meant to certify or to influence may be known. The object of the inquiry is to make out the witness's or the legislator's intention, through the indication given by their words. This is a question, as the Germans express it, of hermeneutics. The operation is not a process of inference, but a process of interpretation.

In this last phrase we have obtained an expression which appears to me to characterize, more aptly than any other, the functions of the syllogism in all cases. When the premises are given by authority, the function of Reasoning is to ascertain the testimony of a witness, or the will of a legislator, by interpreting the signs in which the one has intimated his assertion and the other his command. In like manner, when the premises are derived from observation, the function of Reasoning is to ascertain what we (or our predecessors) formerly thought might be inferred from the observed facts, and to do this by interpreting a memorandum of ours, or of theirs. The memorandum reminds us, that from evidence, more or less carefully weighed, it formerly appeared that a certain attribute might be inferred wherever we perceive a certain mark. The proposition, All men are mortal (for instance) shows that we have had experience from which we thought it followed that the attributes connoted by the term man, are a mark of mortality. But when we conclude that the Duke of Wellington is mortal, we do not infer this from the memorandum, but from the former experience. All that we infer from the memorandum is our own previous belief, (or that of those who transmitted to us the proposition), concerning the inferences which that former experience would warrant.

This view of the nature of the syllogism renders consistent and intelligible what otherwise remains obscure and confused in the theory of Archbishop Whately and other enlightened defenders of the syllogistic doctrine, respecting the limits to which its functions are confined. They affirm in as explicit terms as can be used, that the sole office of general reasoning is to prevent inconsistency in our opinions; to prevent us from assenting to any thing, the truth of which would contradict something to which we had previously on good grounds given our assent. And they tell us, that the sole ground which a syllogism affords for assenting to the conclusion, is that the supposition of its being false, combined with the supposition that the premises are true, would lead to a contradiction in terms. Now this would be but a lame account of the real grounds which we have for believing the facts which we learn from reasoning, in contradistinction to observation. The true reason why we believe that the Duke of Wellington will die, is that his fathers, and our fathers, and all other persons who were contemporary with them, have died. Those facts are the real premises of the reasoning. But we are not led to infer the conclusion from those premises, by the necessity of avoiding any verbal inconsistency. There is no contradiction in supposing that all those persons have died, and that the Duke of Wellington may, notwithstanding, live forever. But there would be a contradiction if we first, on the ground of those same premises, made a general assertion including and covering the case of the Duke of Wellington, and then refused to stand to it in the individual case. There is an inconsistency to be avoided between the memorandum we make of the inferences which may be justly drawn in future cases, and the inferences we actually draw in those cases when they arise. With this view we interpret our own formula, precisely as a judge interprets a law: in order that we may avoid drawing any inferences not conformable to our former intention, as a judge avoids giving any decision not conformable to the legislator's intention. The rules for this interpretation are the rules of the syllogism: and its sole purpose is to maintain consistency between the conclusions we draw in every particular case, and the previous general directions for drawing them; whether those general directions were framed by ourselves as the result of induction, or were received by us from an authority competent to give them.

§ 5. In the above observations it has, I think, been shown, that, though there is always a process of reasoning or inference where a syllogism is used, the syllogism is not a correct analysis of that process of reasoning or inference; which is, on the contrary (when not a mere inference from testimony), an inference from particulars to particulars; authorized by a previous inference from particulars to generals, and substantially the same with it; of the nature, therefore, of Induction. But while these conclusions appear

to me undeniable, I must yet enter a protest, as strong as that of Archbishop Whately himself, against the doctrine that the syllogistic art is useless for the purposes of reasoning. The reasoning lies in the act of generalization, not in interpreting the record of that act; but the syllogistic form is an indispensable collateral security for the correctness of the generalization itself.

It has already been seen, that if we have a collection of particulars sufficient for grounding an induction, we need not frame a general proposition; we may reason at once from those particulars to other particulars. But it is to be remarked withal, that whenever, from a set of particular cases, we can legitimately draw any inference, we may legitimately make our inference a general one. If, from observation and experiment, we can conclude to one new case, so may we to an indefinite number. If that which has held true in our past experience will therefore hold in time to come, it will hold not merely in some individual case, but in all cases of some given description. Every induction, therefore, which suffices to prove one fact, proves an indefinite multitude of facts: the experience which justifies a single prediction must be such as will suffice to bear out a general theorem. This theorem it is extremely important to ascertain and declare, in its broadest form of generality; and thus to place before our minds, in its full extent, the whole of what our evidence must prove if it proves any thing.

This throwing of the whole body of possible inferences from a given set of particulars, into one general expression, operates as a security for their being just inferences, in more ways than one. First, the general principle presents a larger object to the imagination than any of the singular propositions which it contains. A process of thought which leads to a comprehensive generality, is felt as of greater importance than one which terminates in an insulated fact; and the mind is, even unconsciously, led to bestow greater attention upon the process, and to weigh more carefully the sufficiency of the experience appealed to, for supporting the inference grounded upon it. There is another, and a more important, advantage. In reasoning from a course of individual observations to some new and unobserved case, which we are but imperfectly acquainted with (or we should not be inquiring into it), and in which, since we are inquiring into it, we probably feel a peculiar interest; there is very little to prevent us from giving way to negligence, or to any bias which may affect our wishes or our imagination, and, under that influence, accepting insufficient evidence as sufficient. But if, instead of concluding straight to the particular case, we place before ourselves an entire class of facts—the whole contents of a general proposition, every tittle of which is legitimately inferable from our premises, if that one particular conclusion is so; there is then a considerable likelihood that if the premises are insufficient, and the general inference therefore, groundless, it will comprise within it some fact or facts the reverse of which we already know to be true; and we shall thus discover the error in our generalization by a _reductio ad impossibile_.

Thus if, during the reign of Marcus Aurelius, a subject of the Roman empire, under the bias naturally given to the imagination and expectations by the lives and characters of the Antonines, had been disposed to expect that Commodus would be a just ruler; supposing him to stop there, he might only have been undeceived by sad experience. But if he reflected that this expectation could not be justifiable unless from the same evidence he was warranted in concluding some general proposition, as, for instance, that all Roman emperors are just rulers; he would immediately have thought of Nero, Domitian, and other instances, which, showing the falsity of the general conclusion, and therefore the insufficiency of the premises, would have warned him that those premises could not prove in the instance of Commodus, what they were inadequate to prove in any collection of cases in which his was included.

The advantage, in judging whether any controverted inference is legitimate, of referring to a parallel case, is universally acknowledged. But by ascending to the general proposition, we bring under our view not one parallel case only, but all possible parallel cases at once; all cases to which the same set of evidentiary considerations are applicable.

When, therefore, we argue from a number of known cases to another case supposed to be analogous, it is always possible, and generally advantageous, to divert our argument into the circuitous channel of an induction from those known cases to a general proposition, and a subsequent application of that general proposition to the unknown case. This second part of the operation, which, as before observed, is essentially a process of interpretation, will be resolvable into a syllogism or a series of syllogisms, the majors of which will be general propositions embracing whole classes of cases; every one of which propositions must be true in all its extent, if the argument is maintainable. If, therefore, any fact fairly coming within the range of one of these general propositions, and consequently asserted by it, is known or suspected to be other than the proposition asserts it to be, this mode of stating the argument causes us to know or to suspect that the original observations, which are the real grounds of our conclusion, are not sufficient to support it. And in proportion to the greater chance of our detecting the inconclusiveness of our evidence, will be the increased reliance we are entitled to place in it if no such evidence of defect shall appear.

The value, therefore, of the syllogistic form, and of the rules for using it correctly, does not consist in their being the form and the rules according to which our reasonings are necessarily, or even usually, made; but in their furnishing us with a mode in which

those reasonings may always be represented, and which is admirably calculated, if they are inconclusive, to bring their inconclusiveness to light. An induction from particulars to generals, followed by a syllogistic process from those generals to other particulars, is a form in which we may always state our reasonings if we please. It is not a form in which we _must_ reason, but it is a form in which we _may_ reason, and into which it is indispensable to throw our reasoning, when there is any doubt of its validity: though when the case is familiar and little complicated, and there is no suspicion of error, we may, and do, reason at once from the known particular cases to unknown ones.(58)

These are the uses of syllogism, as a mode of verifying any given argument. Its ulterior uses, as respects the general course of our intellectual operations, hardly require illustration, being in fact the acknowledged uses of general language. They amount substantially to this, that the inductions may be made once for all: a single careful interrogation of experience may suffice, and the result may be registered in the form of a general proposition, which is committed to memory or to writing, and from which afterward we have only to syllogize. The particulars of our experiments may then be dismissed from the memory, in which it would be impossible to retain so great a multitude of details; while the knowledge which those details afforded for future use, and which would otherwise be lost as soon as the observations were forgotten, or as their record became too bulky for reference, is retained in a commodious and immediately available shape by means of general language.

Against this advantage is to be set the countervailing inconvenience, that inferences originally made on insufficient evidence become consecrated, and, as it were, hardened into general maxims; and the mind cleaves to them from habit, after it has outgrown any liability to be misled by similar fallacious appearances if they were now for the first time presented; but having forgotten the particulars, it does not think of revising its own former decision. An inevitable drawback, which, however considerable in itself, forms evidently but a small set-off against the immense benefits of general language.

The use of the syllogism is in truth no other than the use of general propositions in reasoning. We _can_ reason without them; in simple and obvious cases we habitually do so; minds of great sagacity can do it in cases not simple and obvious, provided their experience supplies them with instances essentially similar to every combination of circumstances likely to arise. But other minds, and the same minds where they have not the same pre-eminent advantages of personal experience, are quite helpless without the aid of general propositions, wherever the case presents the smallest complication; and if we made no general propositions, few persons would get much beyond those simple inferences which are drawn by the more intelligent of the brutes. Though not necessary to reasoning, general propositions are necessary to any considerable progress in reasoning. It is, therefore, natural and indispensable to separate the process of investigation into two parts; and obtain general formulæ for determining what inferences may be drawn, before the occasion arises for drawing the inferences. The work of drawing them is then that of applying the formulæ; and the rules of syllogism are a system of securities for the correctness of the application.

§ 6. To complete the series of considerations connected with the philosophical character of the syllogism, it is requisite to consider, since the syllogism is not the universal type of the reasoning process, what is the real type. This resolves itself into the question, what is the nature of the minor premise, and in what manner it contributes to establish the conclusion: for as to the major, we now fully understand, that the place which it nominally occupies in our reasonings, properly belongs to the individual facts or observations of which it expresses the general result; the major itself being no real part of the argument, but an intermediate halting-place for the mind, interposed by an artifice of language between the real premises and the conclusion, by way of a security, which it is in a most material degree, for the correctness of the process. The minor, however, being an indispensable part of the syllogistic expression of an argument, without doubt either is, or corresponds to, an equally indispensable part of the argument itself, and we have only to inquire what part.

It is perhaps worth while to notice here a speculation of a philosopher to whom mental science is much indebted, but who, though a very penetrating, was a very hasty thinker, and whose want of due circumspection rendered him fully as remarkable for what he did not see, as for what he saw. I allude to Dr. Thomas Brown, whose theory of ratiocination is peculiar. He saw the _petitio principii_ which is inherent in every syllogism, if we consider the major to be itself the evidence by which the conclusion is proved, instead of being, what in fact it is, an assertion of the existence of evidence sufficient to prove any conclusion of a given description. Seeing this, Dr. Brown not only failed to see the immense advantage, in point of security for correctness, which is gained by interposing this step between the real evidence and the conclusion; but he thought it incumbent on him to strike out the major altogether from the reasoning process, without substituting any thing else, and maintained that our reasonings consist only of the minor premise and the conclusion, Socrates is a man, therefore Socrates is mortal: thus actually suppressing, as an unnecessary step in the argument, the appeal to former experience. The absurdity of this was disguised from him by the opinion he adopted, that reasoning is merely analyzing our own general notions, or abstract ideas; and that the proposition, Socrates is mortal, is evolved from the

proposition, Socrates is a man, simply by recognizing the notion of mortality as already contained in the notion we form of a man.

After the explanations so fully entered into on the subject of propositions, much further discussion can not be necessary to make the radical error of this view of ratiocination apparent. If the word man connoted mortality; if the meaning of “mortal” were involved in the meaning of “man;” we might, undoubtedly, evolve the conclusion from the minor alone, because the minor would have already asserted it. But if, as is in fact the case, the word man does not connote mortality, how does it appear that in the mind of every person who admits Socrates to be a man, the idea of man must include the idea of mortality? Dr. Brown could not help seeing this difficulty, and in order to avoid it, was led, contrary to his intention, to re-establish, under another name, that step in the argument which corresponds to the major, by affirming the necessity of _previously perceiving_ the relation between the idea of man and the idea of mortal. If the reasoner has not previously perceived this relation, he will not, says Dr. Brown, infer because Socrates is a man, that Socrates is mortal. But even this admission, though amounting to a surrender of the doctrine that an argument consists of the minor and the conclusion alone, will not save the remainder of Dr. Brown’s theory. The failure of assent to the argument does not take place merely because the reasoner, for want of due analysis, does not perceive that his idea of man includes the idea of mortality; it takes place, much more commonly, because in his mind that relation between the two ideas has never existed. And in truth it never does exist, except as the result of experience. Consenting, for the sake of the argument, to discuss the question on a supposition of which we have recognized the radical incorrectness, namely, that the meaning of a proposition relates to the ideas of the things spoken of, and not to the things themselves; I must yet observe, that the idea of man, as a universal idea, the common property of all rational creatures, can not involve any thing but what is strictly implied in the name. If any one includes in his own private idea of man, as no doubt is always the case, some other attributes, such for instance as mortality, he does so only as the consequence of experience, after having satisfied himself that all men possess that attribute: so that whatever the idea contains, in any person’s mind, beyond what is included in the conventional signification of the word, has been added to it as the result of assent to a proposition; while Dr. Brown’s theory requires us to suppose, on the contrary, that assent to the proposition is produced by evolving, through an analytic process, this very element out of the idea. This theory, therefore, may be considered as sufficiently refuted; and the minor premise must be regarded as totally insufficient to prove the conclusion, except with the assistance of the major, or of that which the major represents, namely, the various singular propositions expressive of the series of observations, of which the generalization called the major premise is the result.

In the argument, then, which proves that Socrates is mortal, one indispensable part of the premises will be as follows: “My father, and my father’s father, A, B, C, and an indefinite number of other persons, were mortal;” which is only an expression in different words of the observed fact that they have died. This is the major premise divested of the _petitio principii_, and cut down to as much as is really known by direct evidence.

In order to connect this proposition with the conclusion Socrates is mortal, the additional link necessary is such a proposition as the following: “Socrates resembles my father, and my father’s father, and the other individuals specified.” This proposition we assert when we say that Socrates is a man. By saying so we likewise assert in what respect he resembles them, namely, in the attributes connoted by the word man. And we conclude that he further resembles them in the attribute mortality.

§ 7. We have thus obtained what we were seeking, a universal type of the reasoning process. We find it resolvable in all cases into the following elements: Certain individuals have a given attribute; an individual or individuals resemble the former in certain other attributes; therefore they resemble them also in the given attribute. This type of ratiocination does not claim, like the syllogism, to be conclusive from the mere form of the expression; nor can it possibly be so. That one proposition does or does not assert the very fact which was already asserted in another, may appear from the form of the expression, that is, from a comparison of the language; but when the two propositions assert facts which are _bona fide_ different, whether the one fact proves the other or not can never appear from the language, but must depend on other considerations. Whether, from the attributes in which Socrates resembles those men who have heretofore died, it is allowable to infer that he resembles them also in being mortal, is a question of Induction; and is to be decided by the principles or canons which we shall hereafter recognize as tests of the correct performance of that great mental operation.

Meanwhile, however, it is certain, as before remarked, that if this inference can be drawn as to Socrates, it can be drawn as to all others who resemble the observed individuals in the same attributes in which he resembles them; that is (to express the thing concisely) of all mankind. If, therefore, the argument be admissible in the case of Socrates, we are at liberty, once for all, to treat the possession of the attributes of man as a mark, or satisfactory evidence, of the attribute of mortality. This we do by laying down the universal proposition, All men are mortal, and interpreting this, as occasion arises, in its application to Socrates and others. By this means we establish a very convenient division of the entire logical operation into two steps; first, that of ascertaining what

attributes are marks of mortality; and, secondly, whether any given individuals possess those marks. And it will generally be advisable, in our speculations on the reasoning process, to consider this double operation as in fact taking place, and all reasoning as carried on in the form into which it must necessarily be thrown to enable us to apply to it any test of its correct performance.

Although, therefore, all processes of thought in which the ultimate premises are particulars, whether we conclude from particulars to a general formula, or from particulars to other particulars according to that formula, are equally Induction; we shall yet, conformably to usage, consider the name Induction as more peculiarly belonging to the process of establishing the general proposition, and the remaining operation, which is substantially that of interpreting the general proposition, we shall call by its usual name, Deduction. And we shall consider every process by which any thing is inferred respecting an unobserved case, as consisting of an Induction followed by a Deduction; because, although the process needs not necessarily be carried on in this form, it is always susceptible of the form, and must be thrown into it when assurance of scientific accuracy is needed and desired.

§ 8. The theory of the syllogism laid down in the preceding pages, has obtained, among other important adhesions, three of peculiar value: those of Sir John Herschel,(59) Dr. Whewell,(60) and Mr. Bailey;(61) Sir John Herschel considering the doctrine, though not strictly “a discovery,” having been anticipated by Berkeley,(62) to be “one of the greatest steps which have yet been made in the philosophy of Logic.” “When we consider” (to quote the further words of the same authority) “the inveteracy of the habits and prejudices which it has cast to the winds,” there is no cause for misgiving in the fact that other thinkers, no less entitled to consideration, have formed a very different estimate of it. Their principal objection can not be better or more succinctly stated than by borrowing a sentence from Archbishop Whately.(63) “In every case where an inference is drawn from Induction (unless that name is to be given to a mere random guess without any grounds at all) we must form a judgment that the instance or instances adduced are _sufficient_ to authorize the conclusion; that it is _allowable_ to take these instances as a sample warranting an inference respecting the whole class;” and the expression of this judgment in words (it has been said by several of my critics) _is_ the major premise.

I quite admit that the major is an affirmation of the sufficiency of the evidence on which the conclusion rests. That it is so, is the very essence of my own theory. And whoever admits that the major premise is _only_ this, adopts the theory in its essentials.

But I can not concede that this recognition of the sufficiency of the evidence—that is, of the correctness of the induction—is a part of the induction itself; unless we ought to say that it is a part of every thing we do, to satisfy ourselves that it has been done rightly. We conclude from known instances to unknown by the impulse of the generalizing propensity; and (until after a considerable amount of practice and mental discipline) the question of the sufficiency of the evidence is only raised by a retrospective act, turning back upon our own footsteps, and examining whether we were warranted in doing what we have provisionally done. To speak of this reflex operation as part of the original one, requiring to be expressed in words in order that the verbal formula may correctly represent the psychological process, appears to me false psychology.(64) We review our syllogistic as well as our inductive processes, and recognize that they have been correctly performed; but logicians do not add a third premise to the syllogism, to express this act of recognition. A careful copyist verifies his transcript by collating it with the original; and if no error appears, he recognizes that the transcript has been correctly made. But we do not call the examination of the copy a part of the act of copying.

The conclusion in an induction is inferred from the evidence itself, and not from a recognition of the sufficiency of the evidence; as I infer that my friend is walking toward me because I see him, and not because I recognize that my eyes are open, and that eyesight is a means of knowledge. In all operations which require care, it is good to assure ourselves that the process has been performed accurately; but the testing of the process is not the process itself; and, besides, may have been omitted altogether, and yet the process be correct. It is precisely because that operation is omitted in ordinary unscientific reasoning, that there is any thing gained in certainty by throwing reasoning into the syllogistic form. To make sure, as far as possible, that it shall not be omitted, we make the testing operation a part of the reasoning process itself. We insist that the inference from particulars to particulars shall pass through a general proposition. But this is a security for good reasoning, not a condition of all reasoning; and in some cases not even a security. Our most familiar inferences are all made before we learn the use of general propositions; and a person of untutored sagacity will skillfully apply his acquired experience to adjacent cases, though he would bungle grievously in fixing the limits of the appropriate general theorem. But though he may conclude rightly, he never, properly speaking, knows whether he has done so or not; he has not tested his reasoning. Now, this is precisely what forms of reasoning do for us. We do not need them to enable us to reason, but to enable us to know whether we reason correctly.

In still further answer to the objection, it may be added that—even when the test has been applied, and the sufficiency of the evidence recognized—if it is sufficient to support the general proposition, it is sufficient also to support an inference from particulars to particulars without passing through the general proposition. The inquirer who has logically satisfied himself that the conditions of legitimate induction were realized in the cases A, B, C, would be as much justified in concluding directly to the Duke of Wellington as in concluding to all men. The general conclusion is never legitimate, unless the particular one would be so too; and in no sense, intelligible to me, can the particular conclusion be said to be drawn from the general one. Whenever there is ground for drawing any conclusion at all from particular instances, there is ground for a general conclusion; but that this general conclusion should be actually drawn, however useful, can not be an indispensable condition of the validity of the inference in the particular case. A man gives away sixpence by the same power by which he disposes of his whole fortune; but it is not necessary to the legality of the smaller act, that he should make a formal assertion of his right to the greater one.

Some additional remarks, in reply to minor objections, are appended.(65)

§ 9. The preceding considerations enable us to understand the true nature of what is termed, by recent writers, Formal Logic, and the relation between it and Logic in the widest sense. Logic, as I conceive it, is the entire theory of the ascertainment of reasoned or inferred truth. Formal Logic, therefore, which Sir William Hamilton from his own point of view, and Archbishop Whately from his, have represented as the whole of Logic properly so called, is really a very subordinate part of it, not being directly concerned with the process of Reasoning or Inference in the sense in which that process is a part of the Investigation of Truth. What, then, is Formal Logic? The name seems to be properly applied to all that portion of doctrine which relates to the equivalence of different modes of expression; the rules for determining when assertions in a given form imply or suppose the truth or falsity of other assertions. This includes the theory of the Import of Propositions, and of their Conversion, Æquipollence, and Opposition; of those falsely called Inductions (to be hereafter spoken of)(66), in which the apparent generalization is a mere abridged statement of cases known individually; and finally, of the syllogism: while the theory of Naming, and of (what is inseparably connected with it) Definition, though belonging still more to the other and larger kind of logic than to this, is a necessary preliminary to this. The end aimed at by Formal Logic, and attained by the observance of its precepts, is not truth, but consistency. It has been seen that this is the only direct purpose of the rules of the syllogism; the intention and effect of which is simply to keep our inferences or conclusions in complete consistency with our general formulæ or directions for drawing them. The Logic of Consistency is a necessary auxiliary to the logic of truth, not only because what is inconsistent with itself or with other truths can not be true, but also because truth can only be successfully pursued by drawing inferences from experience, which, if warrantable at all, admit of being generalized, and, to test their warrantableness, require to be exhibited in a generalized form; after which the correctness of their application to particular cases is a question which specially concerns the Logic of Consistency. This Logic, not requiring any preliminary knowledge of the processes or conclusions of the various sciences, may be studied with benefit in a much earlier stage of education than the Logic of Truth: and the practice which has empirically obtained of teaching it apart, through elementary treatises which do not attempt to include any thing else, though the reasons assigned for the practice are in general very far from philosophical, admits of philosophical justification.

Chapter IV.

Of Trains Of Reasoning, And Deductive Sciences.

§ 1. In our analysis of the syllogism, it appeared that the minor premise always affirms a resemblance between a new case and some cases previously known; while the major premise asserts something which, having been found true of those known cases, we consider ourselves warranted in holding true of any other case resembling the former in certain given particulars.

If all ratiocinations resembled, as to the minor premise, the examples which were exclusively employed in the preceding chapter; if the resemblance, which that premise asserts, were obvious to the senses, as in the proposition “Socrates is a man,” or were at once ascertainable by direct observation; there would be no necessity for trains of reasoning, and Deductive or Ratiocinative Sciences would not exist. Trains of reasoning exist only for the sake of extending an induction founded, as all inductions must be, on observed cases, to other cases in which we not only can not directly observe the fact which is to be proved, but can not directly observe even the mark which is to prove it.

§ 2. Suppose the syllogism to be, All cows ruminate, the animal which is before me is a cow, therefore it ruminates. The minor, if true at all, is obviously so: the only premise the establishment of which requires any anterior process of inquiry, is the major; and provided the induction of which that premise is the expression was correctly performed, the conclusion respecting the animal now

present will be instantly drawn; because, as soon as she is compared with the formula, she will be identified as being included in it. But suppose the syllogism to be the following: All arsenic is poisonous, the substance which is before me is arsenic, therefore it is poisonous. The truth of the minor may not here be obvious at first sight; it may not be intuitively evident, but may itself be known only by inference. It may be the conclusion of another argument, which, thrown into the syllogistic form, would stand thus: Whatever when lighted produces a dark spot on a piece of white porcelain held in the flame, which spot is soluble in hypochloride of calcium, is arsenic; the substance before me conforms to this condition; therefore it is arsenic. To establish, therefore, the ultimate conclusion, The substance before me is poisonous, requires a process, which, in order to be syllogistically expressed, stands in need of two syllogisms; and we have a Train of Reasoning.

When, however, we thus add syllogism to syllogism, we are really adding induction to induction. Two separate inductions must have taken place to render this chain of inference possible; inductions founded, probably, on different sets of individual instances, but which converge in their results, so that the instance which is the subject of inquiry comes within the range of them both. The record of these inductions is contained in the majors of the two syllogisms. First, we, or others for us, have examined various objects which yielded under the given circumstances a dark spot with the given property, and found that they possessed the properties connoted by the word arsenic; they were metallic, volatile, their vapor had a smell of garlic, and so forth. Next, we, or others for us, have examined various specimens which possessed this metallic and volatile character, whose vapor had this smell, etc., and have invariably found that they were poisonous. The first observation we judge that we may extend to all substances whatever which yield that particular kind of dark spot; the second, to all metallic and volatile substances resembling those we examined; and consequently, not to those only which are seen to be such, but to those which are concluded to be such by the prior induction. The substance before us is only seen to come within one of these inductions; but by means of this one, it is brought within the other. We are still, as before, concluding from particulars to particulars; but we are now concluding from particulars observed, to other particulars which are not, as in the simple case, _seen_ to resemble them in material points, but _inferred_ to do so, because resembling them in something else, which we have been led by quite a different set of instances to consider as a mark of the former resemblance.

This first example of a train of reasoning is still extremely simple, the series consisting of only two syllogisms. The following is somewhat more complicated: No government, which earnestly seeks the good of its subjects, is likely to be overthrown; some particular government earnestly seeks the good of its subjects, therefore it is not likely to be overthrown. The major premise in this argument we shall suppose not to be derived from considerations _a priori_, but to be a generalization from history, which, whether correct or erroneous, must have been founded on observation of governments concerning whose desire of the good of their subjects there was no doubt. It has been found, or thought to be found, that these were not easily overthrown, and it has been deemed that those instances warranted an extension of the same predicate to any and every government which resembles them in the attribute of desiring earnestly the good of its subjects. But _does_ the government in question thus resemble them? This may be debated _pro_ and _con_ by many arguments, and must, in any case, be proved by another induction; for we can not directly observe the sentiments and desires of the persons who carry on the government. To prove the minor, therefore, we require an argument in this form: Every government which acts in a certain manner, desires the good of its subjects; the supposed government acts in that particular manner, therefore it desires the good of its subjects. But is it true that the government acts in the manner supposed? This minor also may require proof; still another induction, as thus: What is asserted by intelligent and disinterested witnesses, may be believed to be true; that the government acts in this manner, is asserted by such witnesses, therefore it may be believed to be true. The argument hence consists of three steps. Having the evidence of our senses that the case of the government under consideration resembles a number of former cases, in the circumstance of having something asserted respecting it by intelligent and disinterested witnesses, we infer, first, that, as in those former instances, so in this instance, the assertion is true. Secondly, what was asserted of the government being that it acts in a particular manner, and other governments or persons having been observed to act in the same manner, the government in question is brought into known resemblance with those other governments or persons; and since they were known to desire the good of the people, it is thereupon, by a second induction, inferred that the particular government spoken of, desires the good of the people. This brings that government into known resemblance with the other governments which were thought likely to escape revolution, and thence, by a third induction, it is concluded that this particular government is also likely to escape. This is still reasoning from particulars to particulars, but we now reason to the new instance from three distinct sets of former instances: to one only of those sets of instances do we directly perceive the new one to be similar; but from that similarity we inductively infer that it has the attribute by which it is assimilated to the next set, and brought within the corresponding induction; after which by a repetition of the same operation we infer it to be similar to the third set, and hence a third induction conducts us to the ultimate conclusion.

§ 3. Notwithstanding the superior complication of these examples, compared with those by which in the preceding chapter we illustrated the general theory of reasoning, every doctrine which we then laid down holds equally true in these more intricate cases. The successive general propositions are not steps in the reasoning, are not intermediate links in the chain of inference, between the particulars observed and those to which we apply the observation. If we had sufficiently capacious memories, and a sufficient power of maintaining order among a huge mass of details, the reasoning could go on without any general propositions; they are mere formulæ for inferring particulars from particulars. The principle of general reasoning is (as before explained), that if, from observation of certain known particulars, what was seen to be true of them can be inferred to be true of any others, it may be inferred of all others which are of a certain description. And in order that we may never fail to draw this conclusion in a new case when it can be drawn correctly, and may avoid drawing it when it can not, we determine once for all what are the distinguishing marks by which such cases may be recognized. The subsequent process is merely that of identifying an object, and ascertaining it to have those marks; whether we identify it by the very marks themselves, or by others which we have ascertained (through another and a similar process) to be marks of those marks. The real inference is always from particulars to particulars, from the observed instances to an unobserved one: but in drawing this inference, we conform to a formula which we have adopted for our guidance in such operations, and which is a record of the criteria by which we thought we had ascertained that we might distinguish when the inference could, and when it could not, be drawn. The real premises are the individual observations, even though they may have been forgotten, or, being the observations of others and not of ourselves, may, to us, never have been known: but we have before us proof that we or others once thought them sufficient for an induction, and we have marks to show whether any new case is one of those to which, if then known, the induction would have been deemed to extend. These marks we either recognize at once, or by the aid of other marks, which by another previous induction we collected to be marks of the first. Even these marks of marks may only be recognized through a third set of marks; and we may have a train of reasoning, of any length, to bring a new case within the scope of an induction grounded on particulars its similarity to which is only ascertained in this indirect manner.

Thus, in the preceding example, the ultimate inductive inference was, that a certain government was not likely to be overthrown; this inference was drawn according to a formula in which desire of the public good was set down as a mark of not being likely to be overthrown; a mark of this mark was, acting in a particular manner; and a mark of acting in that manner was, being asserted to do so by intelligent and disinterested witnesses: this mark, the government under discussion was recognized by the senses as possessing. Hence that government fell within the last induction, and by it was brought within all the others. The perceived resemblance of the case to one set of observed particular cases, brought it into known resemblance with another set, and that with a third.

In the more complex branches of knowledge, the deductions seldom consist, as in the examples hitherto exhibited, of a single chain, _a_ a mark of _b, b_ of _c, c_ of _d_, therefore _a_ a mark of _d_. They consist (to carry on the same metaphor) of several chains united at the extremity, as thus: _a_ a mark of _d, b_ of _e, c_ of _f, d e f_ of _n_, therefore _a b c_ a mark of _n_. Suppose, for example, the following combination of circumstances: 1st, rays of light impinging on a reflecting surface; 2d, that surface parabolic; 3d, those rays parallel to each other and to the axis of the surface. It is to be proved that the concourse of these three circumstances is a mark that the reflected rays will pass through the focus of the parabolic surface. Now, each of the three circumstances is singly a mark of something material to the case. Rays of light impinging on a reflecting surface are a mark that those rays will be reflected at an angle equal to the angle of incidence. The parabolic form of the surface, is a mark that, from any point of it, a line drawn to the focus and a line parallel to the axis will make equal angles with the surface. And finally, the parallelism of the rays to the axis is a mark that their angle of incidence coincides with one of these equal angles. The three marks taken together are therefore a mark of all these three things united. But the three united are evidently a mark that the angle of reflection must coincide with the other of the two equal angles, that formed by a line drawn to the focus; and this again, by the fundamental axiom concerning straight lines, is a mark that the reflected rays pass through the focus. Most chains of physical deduction are of this more complicated type; and even in mathematics such are abundant, as in all propositions where the hypothesis includes numerous conditions: “_If_ a circle be taken, and _if_ within that circle a point be taken, not the centre, and _if_ straight lines be drawn from that point to the circumference, then,” etc.

§ 4. The considerations now stated remove a serious difficulty from the view we have taken of reasoning; which view might otherwise have seemed not easily reconcilable with the fact that there are Deductive or Ratiocinative Sciences. It might seem to follow, if all reasoning be induction, that the difficulties of philosophical investigation must lie in the inductions exclusively, and that when these were easy, and susceptible of no doubt or hesitation, there could be no science, or, at least, no difficulties in science. The existence, for example, of an extensive Science of Mathematics, requiring the highest scientific genius in those who contributed to its creation, and calling for a most continued and vigorous exertion of intellect in order to appropriate it when created,

may seem hard to be accounted for on the foregoing theory. But the considerations more recently adduced remove the mystery, by showing, that even when the inductions themselves are obvious, there may be much difficulty in finding whether the particular case which is the subject of inquiry comes within them; and ample room for scientific ingenuity in so combining various inductions, as, by means of one within which the case evidently falls, to bring it within others in which it can not be directly seen to be included.

When the more obvious of the inductions which can be made in any science from direct observations, have been made, and general formulas have been framed, determining the limits within which these inductions are applicable; as often as a new case can be at once seen to come within one of the formulas, the induction is applied to the new case, and the business is ended. But new cases are continually arising, which do not obviously come within any formula whereby the question we want solved in respect of them could be answered. Let us take an instance from geometry: and as it is taken only for illustration, let the reader concede to us for the present, what we shall endeavor to prove in the next chapter, that the first principles of geometry are results of induction. Our example shall be the fifth proposition of the first book of Euclid. The inquiry is, Are the angles at the base of an isosceles triangle equal or unequal? The first thing to be considered is, what inductions we have, from which we can infer equality or inequality. For inferring equality we have the following formulæ: Things which being applied to each other coincide, are equals. Things which are equal to the same thing are equals. A whole and the sum of its parts are equals. The sums of equal things are equals. The differences of equal things are equals. There are no other original formulæ to prove equality. For inferring inequality we have the following: A whole and its parts are unequals. The sums of equal things and unequal things are unequals. The differences of equal things and unequal things are unequals. In all, eight formulæ. The angles at the base of an isosceles triangle do not obviously come within any of these. The formulæ specify certain marks of equality and of inequality, but the angles can not be perceived intuitively to have any of those marks. On examination it appears that they have; and we ultimately succeed in bringing them within the formula, “The differences of equal things are equal.” Whence comes the difficulty of recognizing these angles as the differences of equal things? Because each of them is the difference not of one pair only, but of innumerable pairs of angles; and out of these we had to imagine and select two, which could either be intuitively perceived to be equals, or possessed some of the marks of equality set down in the various formulæ. By an exercise of ingenuity, which, on the part of the first inventor, deserves to be regarded as considerable, two pairs of angles were hit upon, which united these requisites. First, it could be perceived intuitively that their differences were the angles at the base; and, secondly, they possessed one of the marks of equality, namely, coincidence when applied to one another. This coincidence, however, was not perceived intuitively, but inferred, in conformity to another formula.

For greater clearness, I subjoin an analysis of the demonstration. Euclid, it will be remembered, demonstrates his fifth proposition by means of the fourth. This it is not allowable for us to do, because we are undertaking to trace deductive truths not to prior deductions, but to their original inductive foundation. We must, therefore, use the premises of the fourth proposition instead of its conclusion, and prove the fifth directly from first principles. To do so requires six formulas. (We presuppose an equilateral triangle, whose vertices are A, D, E, with point B on the side AD, and point C on the side AE, such that BC is parallel to DE. We must begin, as in Euclid, by prolonging the equal sides AB, AC, to equal distances, and joining the extremities BE, DC.)

FIRST FORMULA.—_The sums of equals are equal._

AD and AE are sums of equals by the supposition. Having that mark of equality, they are concluded by this formula to be equal.

SECOND FORMULA.—_Equal straight lines or angles, being applied to one another, coincide._

AC, AB, are within this formula by supposition; AD, AE, have been brought within it by the preceding step. The angle at A considered as an angle of the triangle ABE, and the same angle considered as an angle of the triangle ACD, are of course within the formula. All these pairs, therefore, possess the property which, according to the second formula, is a mark that when applied to one another they will coincide. Conceive them, then, applied to one another, by turning over the triangle ABE, and laying it on the triangle ACD in such a manner that AB of the one shall lie upon AC of the other. Then, by the equality of the angles, AE will lie on AD. But AB and AC, AE and AD are equals; therefore they will coincide altogether, and of course at their extremities, D, E, and B, C.

THIRD FORMULA.—_Straight lines, having their extremities coincident, coincide._

BE and CD have been brought within this formula by the preceding induction; they will, therefore, coincide.

FOURTH FORMULA.—_Angles, having their sides coincident, coincide._

The third induction having shown that BE and CD coincide, and the second that AB, AC, coincide, the angles ABE and ACD are thereby brought within the fourth formula, and accordingly coincide.

FIFTH FORMULA.—_Things which coincide are equal._

The angles ABE and ACD are brought within this formula by the induction immediately preceding. This train of reasoning being also applicable, _mutatis mutandis_, to the angles EBC, DCB, these also are brought within the fifth formula. And, finally,

SIXTH FORMULA.—_The differences of equals are equal._

The angle ABC being the difference of ABE, CBE, and the angle ACB being the difference of ACD, DCB; which have been proved to be equals; ABC and ACB are brought within the last formula by the whole of the previous process.

The difficulty here encountered is chiefly that of figuring to ourselves the two angles at the base of the triangle ABC as remainders made by cutting one pair of angles out of another, while each pair shall be corresponding angles of triangles which have two sides and the intervening angle equal. It is by this happy contrivance that so many different inductions are brought to bear upon the same particular case. And this not being at all an obvious thought, it may be seen from an example so near the threshold of mathematics, how much scope there may well be for scientific dexterity in the higher branches of that and other sciences, in order so to combine a few simple inductions, as to bring within each of them innumerable cases which are not obviously included in it; and how long, and numerous, and complicated may be the processes necessary for bringing the inductions together, even when each induction may itself be very easy and simple. All the inductions involved in all geometry are comprised in those simple ones, the formulæ of which are the Axioms, and a few of the so-called Definitions. The remainder of the science is made up of the processes employed for bringing unforeseen cases within these inductions; or (in syllogistic language) for proving the minors necessary to complete the syllogisms; the majors being the definitions and axioms. In those definitions and axioms are laid down the whole of the marks, by an artful combination of which it has been found possible to discover and prove all that is proved in geometry. The marks being so few, and the inductions which furnish them being so obvious and familiar; the connecting of several of them together, which constitutes Deductions, or Trains of Reasoning, forms the whole difficulty of the science, and, with a trifling exception, its whole bulk; and hence Geometry is a Deductive Science.

§ 5. It will be seen hereafter(67) that there are weighty scientific reasons for giving to every science as much of the character of a Deductive Science as possible; for endeavoring to construct the science from the fewest and the simplest possible inductions, and to make these, by any combinations however complicated, suffice for proving even such truths, relating to complex cases, as could be proved, if we chose, by inductions from specific experience. Every branch of natural philosophy was originally experimental; each generalization rested on a special induction, and was derived from its own distinct set of observations and experiments. From being sciences of pure experiment, as the phrase is, or, to speak more correctly, sciences in which the reasonings mostly consist of no more than one step, and are expressed by single syllogisms, all these sciences have become to some extent, and some of them in nearly the whole of their extent, sciences of pure reasoning; whereby multitudes of truths, already known by induction from as many different sets of experiments, have come to be exhibited as deductions or corollaries from inductive propositions of a simpler and more universal character. Thus mechanics, hydrostatics, optics, acoustics, thermology, have successively been rendered mathematical; and astronomy was brought by Newton within the laws of general mechanics. Why it is that the substitution of this circuitous mode of proceeding for a process apparently much easier and more natural, is held, and justly, to be the greatest triumph of the investigation of nature, we are not, in this stage of our inquiry, prepared to examine. But it is necessary to remark, that although, by this progressive transformation, all sciences tend to become more and more Deductive, they are not, therefore, the less Inductive; every step in the Deduction is still an Induction. The opposition is not between the terms Deductive and Inductive, but between Deductive and Experimental. A science is experimental, in proportion as every new case, which presents any peculiar features, stands in need of a new set of observations and experiments—a fresh induction. It is deductive, in proportion as it can draw conclusions, respecting cases of a new kind, by processes which bring those cases under old inductions; by ascertaining that cases which can not be observed to have the requisite marks, have, however, marks of those marks.

We can now, therefore, perceive what is the generic distinction between sciences which can be made Deductive, and those which must as yet remain Experimental. The difference consists in our having been able, or not yet able, to discover marks of marks. If by our various inductions we have been able to proceed no further than to such propositions as these, _a_ a mark of _b_, or _a_ and _b_ marks of one another, _c_ a mark of _d_, or c and _d_ marks of one another, without any thing to connect _a_ or _b_ with _c_ or _d_; we have a science of detached and mutually independent generalizations, such as these, that acids redden vegetable

blues, and that alkalies color them green; from neither of which propositions could we, directly or indirectly, infer the other: and a science, so far as it is composed of such propositions, is purely experimental. Chemistry, in the present state of our knowledge, has not yet thrown off this character. There are other sciences, however, of which the propositions are of this kind: _a_ a mark of _b, b_ a mark of _c, c_ of _d, d_ of _e_, etc. In these sciences we can mount the ladder from _a_ to _e_ by a process of ratiocination; we can conclude that _a_ is a mark of _e_, and that every object which has the mark _a_ has the property _e_, although, perhaps, we never were able to observe _a_ and _e_ together, and although even _d_, our only direct mark of _e_, may not be perceptible in those objects, but only inferable. Or, varying the first metaphor, we may be said to get from _a_ to _e_ underground: the marks _b_, _c_, _d_, which indicate the route, must all be possessed somewhere by the objects concerning which we are inquiring; but they are below the surface: _a_ is the only mark that is visible, and by it we are able to trace in succession all the rest.

§ 6. We can now understand how an experimental may transform itself into a deductive science by the mere progress of experiment. In an experimental science, the inductions, as we have said, lie detached, as, _a_ a mark of _b, c_ a mark of _d_, _e_ a mark of _f_, and so on: now, a new set of instances, and a consequent new induction, may at any time bridge over the interval between two of these unconnected arches; _b_, for example, may be ascertained to be a mark of _c_, which enables us thenceforth to prove deductively that _a_ is a mark of _c_. Or, as sometimes happens, some comprehensive induction may raise an arch high in the air, which bridges over hosts of them at once; _b_, _d_, _f_, and all the rest, turning out to be marks of some one thing, or of things between which a connection has already been traced. As when Newton discovered that the motions, whether regular or apparently anomalous, of all the bodies of the solar system (each of which motions had been inferred by a separate logical operation, from separate marks), were all marks of moving round a common centre, with a centripetal force varying directly as the mass, and inversely as the square of the distance from that centre. This is the greatest example which has yet occurred of the transformation, at one stroke, of a science which was still to a great degree merely experimental, into a deductive science.

Transformations of the same nature, but on a smaller scale, continually take place in the less advanced branches of physical knowledge, without enabling them to throw off the character of experimental sciences. Thus with regard to the two unconnected propositions before cited, namely, Acids redden vegetable blues, Alkalies make them green; it is remarked by Liebig, that all blue coloring matters which are reddened by acids (as well as, reciprocally, all red coloring matters which are rendered blue by alkalies) contain nitrogen: and it is quite possible that this circumstance may one day furnish a bond of connection between the two propositions in question, by showing that the antagonistic action of acids and alkalies in producing or destroying the color blue, is the result of some one, more general, law. Although this connecting of detached generalizations is so much gain, it tends but little to give a deductive character to any science as a whole; because the new courses of observation and experiment, which thus enable us to connect together a few general truths, usually make known to us a still greater number of unconnected new ones. Hence chemistry, though similar extensions and simplifications of its generalizations are continually taking place, is still in the main an experimental science; and is likely so to continue unless some comprehensive induction should be hereafter arrived at, which, like Newton’s, shall connect a vast number of the smaller known inductions together, and change the whole method of the science at once. Chemistry has already one great generalization, which, though relating to one of the subordinate aspects of chemical phenomena, possesses within its limited sphere this comprehensive character; the principle of Dalton, called the atomic theory, or the doctrine of chemical equivalents: which by enabling us to a certain extent to foresee the proportions in which two substances will combine, before the experiment has been tried, constitutes undoubtedly a source of new chemical truths obtainable by deduction, as well as a connecting principle for all truths of the same description previously obtained by experiment.

§ 7. The discoveries which change the method of a science from experimental to deductive, mostly consist in establishing, either by deduction or by direct experiment, that the varieties of a particular phenomenon uniformly accompany the varieties of some other phenomenon better known. Thus the science of sound, which previously stood in the lowest rank of merely experimental science, became deductive when it was proved by experiment that every variety of sound was consequent on, and therefore a mark of, a distinct and definable variety of oscillatory motion among the particles of the transmitting medium. When this was ascertained, it followed that every relation of succession or co-existence which obtained between phenomena of the more known class, obtained also between the phenomena which correspond to them in the other class. Every sound, being a mark of a particular oscillatory motion, became a mark of every thing which, by the laws of dynamics, was known to be inferable from that motion; and every thing which by those same laws was a mark of any oscillatory motion among the particles of an elastic medium, became a mark of the corresponding sound. And thus many truths, not before suspected, concerning sound, become deducible from the known laws of the propagation of motion through an elastic medium; while facts already empirically known respecting sound, become an indication of corresponding properties of vibrating bodies, previously undiscovered.

But the grand agent for transforming experimental into deductive sciences, is the science of number. The properties of number, alone among all known phenomena, are, in the most rigorous sense, properties of all things whatever. All things are not colored, or ponderable, or even extended; but all things are numerable. And if we consider this science in its whole extent, from common arithmetic up to the calculus of variations, the truths already ascertained seem all but infinite, and admit of indefinite extension.

These truths, though affirmable of all things whatever, of course apply to them only in respect of their quantity. But if it comes to be discovered that variations of quality in any class of phenomena, correspond regularly to variations of quantity either in those same or in some other phenomena; every formula of mathematics applicable to quantities which vary in that particular manner, becomes a mark of a corresponding general truth, respecting the variations in quality which accompany them: and the science of quantity being (as far as any science can be) altogether deductive, the theory of that particular kind of qualities becomes, to this extent, deductive likewise.

The most striking instance in point which history affords (though not an example of an experimental science rendered deductive, but of an unparalleled extension given to the deductive process in a science which was deductive already), is the revolution in geometry which originated with Descartes, and was completed by Clairaut. These great mathematicians pointed out the importance of the fact, that to every variety of position in points, direction in lines, or form in curves or surfaces (all of which are Qualities), there corresponds a peculiar relation of quantity between either two or three rectilineal co-ordinates; insomuch that if the law were known according to which those co-ordinates vary relatively to one another, every other geometrical property of the line or surface in question, whether relating to quantity or quality, would be capable of being inferred. Hence it followed that every geometrical question could be solved, if the corresponding algebraical one could; and geometry received an accession (actual or potential) of new truths, corresponding to every property of numbers which the progress of the calculus had brought, or might in future bring, to light. In the same general manner, mechanics, astronomy, and in a less degree, every branch of natural philosophy commonly so called, have been made algebraical. The varieties of physical phenomena with which those sciences are conversant, have been found to answer to determinable varieties in the quantity of some circumstance or other; or at least to varieties of form or position, for which corresponding equations of quantity had already been, or were susceptible of being, discovered by geometers.

In these various transformations, the propositions of the science of number do but fulfill the function proper to all propositions forming a train of reasoning, viz., that of enabling us to arrive in an indirect method, by marks of marks, at such of the properties of objects as we can not directly ascertain (or not so conveniently) by experiment. We travel from a given visible or tangible fact, through the truths of numbers, to the facts sought. The given fact is a mark that a certain relation subsists between the quantities of some of the elements concerned; while the fact sought presupposes a certain relation between the quantities of some other elements: now, if these last quantities are dependent in some known manner upon the former, or _vicè versa_, we can argue from the numerical relation between the one set of quantities, to determine that which subsists between the other set; the theorems of the calculus affording the intermediate links. And thus one of the two physical facts becomes a mark of the other, by being a mark of a mark of a mark of it.

Chapter V.

Of Demonstration, And Necessary Truths.

§ 1. If, as laid down in the two preceding chapters, the foundation of all sciences, even deductive or demonstrative sciences, is Induction; if every step in the ratiocinations even of geometry is an act of induction; and if a train of reasoning is but bringing many inductions to bear upon the same subject of inquiry, and drawing a case within one induction by means of another; wherein lies the peculiar certainty always ascribed to the sciences which are entirely, or almost entirely, deductive? Why are they called the Exact Sciences? Why are mathematical certainty, and the evidence of demonstration, common phrases to express the very highest degree of assurance attainable by reason? Why are mathematics by almost all philosophers, and (by some) even those branches of natural philosophy which, through the medium of mathematics, have been converted into deductive sciences, considered to be independent of the evidence of experience and observation, and characterized as systems of Necessary Truth?

The answer I conceive to be, that this character of necessity, ascribed to the truths of mathematics, and (even with some reservations to be hereafter made) the peculiar certainty attributed to them, is an illusion; in order to sustain which, it is necessary to suppose that those truths relate to, and express the properties of, purely imaginary objects. It is acknowledged that the conclusions of geometry are deduced, partly at least, from the so-called Definitions, and that those definitions are assumed to be correct representations, as far as they go, of the objects with which geometry is conversant. Now we have pointed out that, from a

definition as such, no proposition, unless it be one concerning the meaning of a word, can ever follow; and that what apparently follows from a definition, follows in reality from an implied assumption that there exists a real thing conformable thereto. This assumption, in the case of the definitions of geometry, is not strictly true: there exist no real things exactly conformable to the definitions. There exist no points without magnitude; no lines without breadth, nor perfectly straight; no circles with all their radii exactly equal, nor squares with all their angles perfectly right. It will perhaps be said that the assumption does not extend to the actual, but only to the possible, existence of such things. I answer that, according to any test we have of possibility, they are not even possible. Their existence, so far as we can form any judgment, would seem to be inconsistent with the physical constitution of our planet at least, if not of the universe. To get rid of this difficulty, and at the same time to save the credit of the supposed system of necessary truth, it is customary to say that the points, lines, circles, and squares which are the subject of geometry, exist in our conceptions merely, and are part of our minds; which minds, by working on their own materials, construct an _a priori_ science, the evidence of which is purely mental, and has nothing whatever to do with outward experience. By howsoever high authorities this doctrine may have been sanctioned, it appears to me psychologically incorrect. The points, lines, circles, and squares which any one has in his mind, are (I apprehend) simply copies of the points, lines, circles, and squares which he has known in his experience. Our idea of a point, I apprehend to be simply our idea of the _minimum visibile_, the smallest portion of surface which we can see. A line, as defined by geometers, is wholly inconceivable. We can reason about a line as if it had no breadth; because we have a power, which is the foundation of all the control we can exercise over the operations of our minds; the power, when a perception is present to our senses, or a conception to our intellects, of _attending_ to a part only of that perception or conception, instead of the whole. But we can not _conceive_ a line without breadth; we can form no mental picture of such a line: all the lines which we have in our minds are lines possessing breadth. If any one doubts this, we may refer him to his own experience. I much question if any one who fancies that he can conceive what is called a mathematical line, thinks so from the evidence of his consciousness: I suspect it is rather because he supposes that unless such a conception were possible, mathematics could not exist as a science: a supposition which there will be no difficulty in showing to be entirely groundless.

Since, then, neither in nature, nor in the human mind, do there exist any objects exactly corresponding to the definitions of geometry, while yet that science can not be supposed to be conversant about nonentities; nothing remains but to consider geometry as conversant with such lines, angles, and figures, as really exist; and the definitions, as they are called, must be regarded as some of our first and most obvious generalizations concerning those natural objects. The correctness of those generalizations, as generalizations, is without a flaw: the equality of all the radii of a circle is true of all circles, so far as it is true of any one: but it is not exactly true of any circle; it is only nearly true; so nearly that no error of any importance in practice will be incurred by feigning it to be exactly true. When we have occasion to extend these inductions, or their consequences, to cases in which the error would be appreciable—to lines of perceptible breadth or thickness, parallels which deviate sensibly from equidistance, and the like—we correct our conclusions, by combining with them a fresh set of propositions relating to the aberration; just as we also take in propositions relating to the physical or chemical properties of the material, if those properties happen to introduce any modification into the result; which they easily may, even with respect to figure and magnitude, as in the case, for instance, of expansion by heat. So long, however, as there exists no practical necessity for attending to any of the properties of the object except its geometrical properties, or to any of the natural irregularities in those, it is convenient to neglect the consideration of the other properties and of the irregularities, and to reason as if these did not exist: accordingly, we formally announce in the definitions, that we intend to proceed on this plan. But it is an error to suppose, because we resolve to confine our attention to a certain number of the properties of an object, that we therefore conceive, or have an idea of, the object, denuded of its other properties. We are thinking, all the time, of precisely such objects as we have seen and touched, and with all the properties which naturally belong to them; but, for scientific convenience, we feign them to be divested of all properties, except those which are material to our purpose, and in regard to which we design to consider them.

The peculiar accuracy, supposed to be characteristic of the first principles of geometry, thus appears to be fictitious. The assertions on which the reasonings of the science are founded, do not, any more than in other sciences, exactly correspond with the fact; but we suppose that they do so, for the sake of tracing the consequences which follow from the supposition. The opinion of Dugald Stewart respecting the foundations of geometry, is, I conceive, substantially correct; that it is built on hypotheses; that it owes to this alone the peculiar certainty supposed to distinguish it; and that in any science whatever, by reasoning from a set of hypotheses, we may obtain a body of conclusions as certain as those of geometry, that is, as strictly in accordance with the hypotheses, and as irresistibly compelling assent, _on condition_ that those hypotheses are true.(68)

When, therefore, it is affirmed that the conclusions of geometry are necessary truths, the necessity consists in reality only in this, that they correctly follow from the suppositions from which they are deduced. Those suppositions are so far from being necessary,

that they are not even true; they purposely depart, more or less widely, from the truth. The only sense in which necessity can be ascribed to the conclusions of any scientific investigation, is that of legitimately following from some assumption, which, by the conditions of the inquiry, is not to be questioned. In this relation, of course, the derivative truths of every deductive science must stand to the inductions, or assumptions, on which the science is founded, and which, whether true or untrue, certain or doubtful in themselves, are always supposed certain for the purposes of the particular science. And therefore the conclusions of all deductive sciences were said by the ancients to be necessary propositions. We have observed already that to be predicated necessarily was characteristic of the predicable Proprium, and that a proprium was any property of a thing which could be deduced from its essence, that is, from the properties included in its definition.

§ 2. The important doctrine of Dugald Stewart, which I have endeavored to enforce, has been contested by Dr. Whewell, both in the dissertation appended to his excellent _Mechanical Euclid_, and in his elaborate work on the _Philosophy of the Inductive Sciences_; in which last he also replies to an article in the Edinburgh Review (ascribed to a writer of great scientific eminence), in which Stewart's opinion was defended against his former strictures. The supposed refutation of Stewart consists in proving against him (as has also been done in this work) that the premises of geometry are not definitions, but assumptions of the real existence of things corresponding to those definitions. This, however, is doing little for Dr. Whewell's purpose; for it is these very assumptions which are asserted to be hypotheses, and which he, if he denies that geometry is founded on hypotheses, must show to be absolute truths. All he does, however, is to observe, that they, at any rate, are not _arbitrary_ hypotheses; that we should not be at liberty to substitute other hypotheses for them; that not only "a definition, to be admissible, must necessarily refer to and agree with some conception which we can distinctly frame in our thoughts," but that the straight lines, for instance, which we define, must be "those by which angles are contained, those by which triangles are bounded, those of which parallelism may be predicated, and the like."(69) And this is true; but this has never been contradicted. Those who say that the premises of geometry are hypotheses, are not bound to maintain them to be hypotheses which have no relation whatever to fact. Since an hypothesis framed for the purpose of scientific inquiry must relate to something which has real existence (for there can be no science respecting nonentities), it follows that any hypothesis we make respecting an object, to facilitate our study of it, must not involve any thing which is distinctly false, and repugnant to its real nature: we must not ascribe to the thing any property which it has not; our liberty extends only to slightly exaggerating some of those which it has (by assuming it to be completely what it really is very nearly), and suppressing others, under the indispensable obligation of restoring them whenever, and in as far as, their presence or absence would make any material difference in the truth of our conclusions. Of this nature, accordingly, are the first principles involved in the definitions of geometry. That the hypotheses should be of this particular character, is, however, no further necessary, than inasmuch as no others could enable us to deduce conclusions which, with due corrections, would be true of real objects: and in fact, when our aim is only to illustrate truths, and not to investigate them, we are not under any such restriction. We might suppose an imaginary animal, and work out by deduction, from the known laws of physiology, its natural history; or an imaginary commonwealth, and from the elements composing it, might argue what would be its fate. And the conclusions which we might thus draw from purely arbitrary hypotheses, might form a highly useful intellectual exercise: but as they could only teach us what _would_ be the properties of objects which do not really exist, they would not constitute any addition to our knowledge of nature: while, on the contrary, if the hypothesis merely divests a real object of some portion of its properties, without clothing it in false ones, the conclusions will always express, under known liability to correction, actual truth.

§ 3. But though Dr. Whewell has not shaken Stewart's doctrine as to the hypothetical character of that portion of the first principles of geometry which are involved in the so-called definitions, he has, I conceive, greatly the advantage of Stewart on another important point in the theory of geometrical reasoning; the necessity of admitting, among those first principles, axioms as well as definitions. Some of the axioms of Euclid might, no doubt, be exhibited in the form of definitions, or might be deduced, by reasoning, from propositions similar to what are so called. Thus, if instead of the axiom, Magnitudes which can be made to coincide are equal, we introduce a definition, "Equal magnitudes are those which may be so applied to one another as to coincide;" the three axioms which follow (Magnitudes which are equal to the same are equal to one another—If equals are added to equals, the sums are equal—If equals are taken from equals, the remainders are equal), may be proved by an imaginary superposition, resembling that by which the fourth proposition of the first book of Euclid is demonstrated. But though these and several others may be struck out of the list of first principles, because, though not requiring demonstration, they are susceptible of it; there will be found in the list of axioms two or three fundamental truths, not capable of being demonstrated: among which must be reckoned the proposition that two straight lines can not inclose a space (or its equivalent, Straight lines which coincide in two points coincide altogether), and some property of parallel lines, other than that which constitutes their definition: one of the most suitable for the purpose being that selected by Professor Playfair: "Two straight lines which intersect each other can not both of them be parallel to a third straight

line."(70)

The axioms, as well those which are indemonstrable as those which admit of being demonstrated, differ from that other class of fundamental principles which are involved in the definitions, in this, that they are true without any mixture of hypothesis. That things which are equal to the same thing are equal to one another, is as true of the lines and figures in nature, as it would be of the imaginary ones assumed in the definitions. In this respect, however, mathematics are only on a par with most other sciences. In almost all sciences there are some general propositions which are exactly true, while the greater part are only more or less distant approximations to the truth. Thus in mechanics, the first law of motion (the continuance of a movement once impressed, until stopped or slackened by some resisting force) is true without qualification or error. The rotation of the earth in twenty-four hours, of the same length as in our time, has gone on since the first accurate observations, without the increase or diminution of one second in all that period. These are inductions which require no fiction to make them be received as accurately true: but along with them there are others, as for instance the propositions respecting the figure of the earth, which are but approximations to the truth; and in order to use them for the further advancement of our knowledge, we must feign that they are exactly true, though they really want something of being so.

§ 4. It remains to inquire, what is the ground of our belief in axioms—what is the evidence on which they rest? I answer, they are experimental truths; generalizations from observation. The proposition, Two straight lines can not inclose a space—or, in other words, Two straight lines which have once met, do not meet again, but continue to diverge—is an induction from the evidence of our senses.

This opinion runs counter to a scientific prejudice of long standing and great strength, and there is probably no proposition enunciated in this work for which a more unfavorable reception is to be expected. It is, however, no new opinion; and even if it were so, would be entitled to be judged, not by its novelty, but by the strength of the arguments by which it can be supported. I consider it very fortunate that so eminent a champion of the contrary opinion as Dr. Whewell has found occasion for a most elaborate treatment of the whole theory of axioms, in attempting to construct the philosophy of the mathematical and physical sciences on the basis of the doctrine against which I now contend. Whoever is anxious that a discussion should go to the bottom of the subject, must rejoice to see the opposite side of the question worthily represented. If what is said by Dr. Whewell, in support of an opinion which he has made the foundation of a systematic work, can be shown not to be conclusive, enough will have been done, without going elsewhere in quest of stronger arguments and a more powerful adversary.

It is not necessary to show that the truths which we call axioms are originally _suggested_ by observation, and that we should never have known that two straight lines can not inclose a space if we had never seen a straight line: thus much being admitted by Dr. Whewell, and by all, in recent times, who have taken his view of the subject. But they contend, that it is not experience which _proves_ the axiom; but that its truth is perceived _a priori_, by the constitution of the mind itself, from the first moment when the meaning of the proposition is apprehended; and without any necessity for verifying it by repeated trials, as is requisite in the case of truths really ascertained by observation.

They can not, however, but allow that the truth of the axiom, Two straight lines can not inclose a space, even if evident independently of experience, is also evident from experience. Whether the axiom needs confirmation or not, it receives confirmation in almost every instant of our lives; since we can not look at any two straight lines which intersect one another, without seeing that from that point they continue to diverge more and more. Experimental proof crowds in upon us in such endless profusion, and without one instance in which there can be even a suspicion of an exception to the rule, that we should soon have stronger ground for believing the axiom, even as an experimental truth, than we have for almost any of the general truths which we confessedly learn from the evidence of our senses. Independently of _a priori_ evidence, we should certainly believe it with an intensity of conviction far greater than we accord to any ordinary physical truth: and this too at a time of life much earlier than that from which we date almost any part of our acquired knowledge, and much too early to admit of our retaining any recollection of the history of our intellectual operations at that period. Where then is the necessity for assuming that our recognition of these truths has a different origin from the rest of our knowledge, when its existence is perfectly accounted for by supposing its origin to be the same? when the causes which produce belief in all other instances, exist in this instance, and in a degree of strength as much superior to what exists in other cases, as the intensity of the belief itself is superior? The burden of proof lies on the advocates of the contrary opinion: it is for them to point out some fact, inconsistent with the supposition that this part of our knowledge of nature is derived from the same sources as every other part.(71)

This, for instance, they would be able to do, if they could prove chronologically that we had the conviction (at least practically) so early in infancy as to be anterior to those impressions on the senses, upon which, on the other theory, the conviction is founded. This, however, can not be proved: the point being too far back to be within the reach of memory, and too obscure for external observation. The advocates of the _a priori_ theory are obliged to have recourse to other arguments. These are reducible to two, which I shall endeavor to state as clearly and as forcibly as possible.

§ 5. In the first place it is said, that if our assent to the proposition that two straight lines can not inclose a space, were derived from the senses, we could only be convinced of its truth by actual trial, that is, by seeing or feeling the straight lines; whereas, in fact, it is seen to be true by merely thinking of them. That a stone thrown into water goes to the bottom, may be perceived by our senses, but mere thinking of a stone thrown into the water would never have led us to that conclusion: not so, however, with the axioms relating to straight lines: if I could be made to conceive what a straight line is, without having seen one, I should at once recognize that two such lines can not inclose a space. Intuition is “imaginary looking;”(72) but experience must be real looking: if we see a property of straight lines to be true by merely fancying ourselves to be looking at them, the ground of our belief can not be the senses, or experience; it must be something mental.

To this argument it might be added in the case of this particular axiom (for the assertion would not be true of all axioms), that the evidence of it from actual ocular inspection is not only unnecessary, but unattainable. What says the axiom? That two straight lines _can not_ inclose a space; that after having once intersected, if they are prolonged to infinity they do not meet, but continue to diverge from one another. How can this, in any single case, be proved by actual observation? We may follow the lines to any distance we please; but we can not follow them to infinity: for aught our senses can testify, they may, immediately beyond the farthest point to which we have traced them, begin to approach, and at last meet. Unless, therefore, we had some other proof of the impossibility than observation affords us, we should have no ground for believing the axiom at all.

To these arguments, which I trust I can not be accused of understating, a satisfactory answer will, I conceive, be found, if we advert to one of the characteristic properties of geometrical forms—their capacity of being painted in the imagination with a distinctness equal to reality: in other words, the exact resemblance of our ideas of form to the sensations which suggest them. This, in the first place, enables us to make (at least with a little practice) mental pictures of all possible combinations of lines and angles, which resemble the realities quite as well as any which we could make on paper; and in the next place, make those pictures just as fit subjects of geometrical experimentation as the realities themselves; inasmuch as pictures, if sufficiently accurate, exhibit of course all the properties which would be manifested by the realities at one given instant, and on simple inspection: and in geometry we are concerned only with such properties, and not with that which pictures could not exhibit, the mutual action of bodies one upon another. The foundations of geometry would therefore be laid in direct experience, even if the experiments (which in this case consist merely in attentive contemplation) were practiced solely upon what we call our ideas, that is, upon the diagrams in our minds, and not upon outward objects. For in all systems of experimentation we take some objects to serve as representatives of all which resemble them; and in the present case the conditions which qualify a real object to be the representative of its class, are completely fulfilled by an object existing only in our fancy. Without denying, therefore, the possibility of satisfying ourselves that two straight lines can not inclose a space, by merely thinking of straight lines without actually looking at them; I contend, that we do not believe this truth on the ground of the imaginary intuition simply, but because we know that the imaginary lines exactly resemble real ones, and that we may conclude from them to real ones with quite as much certainty as we could conclude from one real line to another. The conclusion, therefore, is still an induction from observation. And we should not be authorized to substitute observation of the image in our mind, for observation of the reality, if we had not learned by long-continued experience that the properties of the reality are faithfully represented in the image; just as we should be scientifically warranted in describing an animal which we have never seen, from a picture made of it with a daguerreotype; but not until we had learned by ample experience, that observation of such a picture is precisely equivalent to observation of the original.

These considerations also remove the objection arising from the impossibility of ocularly following the lines in their prolongation to infinity. For though, in order actually to see that two given lines never meet, it would be necessary to follow them to infinity; yet without doing so we may know that if they ever do meet, or if, after diverging from one another, they begin again to approach, this must take place not at an infinite, but at a finite distance. Supposing, therefore, such to be the case, we can transport ourselves thither in imagination, and can frame a mental image of the appearance which one or both of the lines must present at that point, which we may rely on as being precisely similar to the reality. Now, whether we fix our contemplation upon this imaginary picture, or call to mind the generalizations we have had occasion to make from former ocular observation, we learn by the evidence of experience, that a line which, after diverging from another straight line, begins to approach to it, produces the impression on our

senses which we describe by the expression, “a bent line,” not by the expression, “a straight line.”(73)

The preceding argument, which is, to my mind unanswerable, merges, however, in a still more comprehensive one, which is stated most clearly and conclusively by Professor Bain. The psychological reason why axioms, and indeed many propositions not ordinarily classed as such, may be learned from the idea only without referring to the fact, is that in the process of acquiring the idea we have learned the fact. The proposition is assented to as soon as the terms are understood, because in learning to understand the terms we have acquired the experience which proves the proposition to be true. “We required,” says Mr. Bain,(74) “concrete experience in the first instance, to attain to the notion of whole and part; but the notion, once arrived at, implies that the whole is greater. In fact, we could not have the notion without an experience tantamount to this conclusion.... When we have mastered the notion of straightness, we have also mastered that aspect of it expressed by the affirmation that two straight lines can not inclose a space. No intuitive or innate powers or perceptions are needed in such case.... We can not have the full meaning of Straightness, without going through a comparison of straight objects among themselves, and with their opposites, bent or crooked objects. The result of this comparison is, _inter alia_, that straightness in two lines is seen to be incompatible with inclosing a space; the inclosure of space involves crookedness in at least one of the lines.” And similarly, in the case of every first principle,(75) “the same knowledge that makes it understood, suffices to verify it.” The more this observation is considered the more (I am convinced) it will be felt to go to the very root of the controversy.

§ 6. The first of the two arguments in support of the theory that axioms are _a priori_ truths, having, I think, been sufficiently answered; I proceed to the second, which is usually the most relied on. Axioms (it is asserted) are conceived by us not only as true, but as universally and necessarily true. Now, experience can not possibly give to any proposition this character. I may have seen snow a hundred times, and may have seen that it was white, but this can not give me entire assurance even that all snow is white; much less that snow _must_ be white. “However many instances we may have observed of the truth of a proposition, there is nothing to assure us that the next case shall not be an exception to the rule. If it be strictly true that every ruminant animal yet known has cloven hoofs, we still can not be sure that some creature will not hereafter be discovered which has the first of these attributes, without having the other.... Experience must always consist of a limited number of observations; and, however numerous these may be, they can show nothing with regard to the infinite number of cases in which the experiment has not been made.” Besides, Axioms are not only universal, they are also necessary. Now “experience can not offer the smallest ground for the necessity of a proposition. She can observe and record what has happened; but she can not find, in any case, or in any accumulation of cases, any reason for what _must_ happen. She may see objects side by side; but she can not see a reason why they must ever be side by side. She finds certain events to occur in succession; but the succession supplies, in its occurrence, no reason for its recurrence. She contemplates external objects; but she can not detect any internal bond, which indissolubly connects the future with the past, the possible with the real. To learn a proposition by experience, and to see it to be necessarily true, are two altogether different processes of thought.”(76) And Dr. Whewell adds, “If any one does not clearly comprehend this distinction of necessary and contingent truths, he will not be able to go along with us in our researches into the foundations of human knowledge; nor, indeed, to pursue with success any speculation on the subject.”(77)

In the following passage, we are told what the distinction is, the non-recognition of which incurs this denunciation. “Necessary truths are those in which we not only learn that the proposition _is_ true, but see that it _must be_ true; in which the negation of the truth is not only false, but impossible; in which we can not, even by an effort of imagination, or in a supposition, conceive the reverse of that which is asserted. That there are such truths can not be doubted. We may take, for example, all relations of number. Three and Two added together make Five. We can not conceive it to be otherwise. We can not, by any freak of thought, imagine Three and Two to make Seven.”(78)

Although Dr. Whewell has naturally and properly employed a variety of phrases to bring his meaning more forcibly home, he would, I presume, allow that they are all equivalent; and that what he means by a necessary truth, would be sufficiently defined, a proposition the negation of which is not only false but inconceivable. I am unable to find in any of his expressions, turn them what way you will, a meaning beyond this, and I do not believe he would contend that they mean any thing more.

This, therefore, is the principle asserted: that propositions, the negation of which is inconceivable, or in other words, which we can not figure to ourselves as being false, must rest on evidence of a higher and more cogent description than any which experience can afford.

Now I can not but wonder that so much stress should be laid on the circumstance of inconceivableness, when there is such ample experience to show, that our capacity or incapacity of conceiving a thing has very little to do with the possibility of the thing in itself;

but is in truth very much an affair of accident, and depends on the past history and habits of our own minds. There is no more generally acknowledged fact in human nature, than the extreme difficulty at first felt in conceiving any thing as possible, which is in contradiction to long established and familiar experience; or even to old familiar habits of thought. And this difficulty is a necessary result of the fundamental laws of the human mind. When we have often seen and thought of two things together, and have never in any one instance either seen or thought of them separately, there is by the primary law of association an increasing difficulty, which may in the end become insuperable, of conceiving the two things apart. This is most of all conspicuous in uneducated persons, who are in general utterly unable to separate any two ideas which have once become firmly associated in their minds; and if persons of cultivated intellect have any advantage on the point, it is only because, having seen and heard and read more, and being more accustomed to exercise their imagination, they have experienced their sensations and thoughts in more varied combinations, and have been prevented from forming many of these inseparable associations. But this advantage has necessarily its limits. The most practiced intellect is not exempt from the universal laws of our conceptive faculty. If daily habit presents to any one for a long period two facts in combination, and if he is not led during that period either by accident or by his voluntary mental operations to think of them apart, he will probably in time become incapable of doing so even by the strongest effort; and the supposition that the two facts can be separated in nature, will at last present itself to his mind with all the characters of an inconceivable phenomenon.(79) There are remarkable instances of this in the history of science: instances in which the most instructed men rejected as impossible, because inconceivable, things which their posterity, by earlier practice and longer perseverance in the attempt, found it quite easy to conceive, and which every body now knows to be true. There was a time when men of the most cultivated intellects, and the most emancipated from the dominion of early prejudice, could not credit the existence of antipodes; were unable to conceive, in opposition to old association, the force of gravity acting upward instead of downward. The Cartesians long rejected the Newtonian doctrine of the gravitation of all bodies toward one another, on the faith of a general proposition, the reverse of which seemed to them to be inconceivable—the proposition that a body can not act where it is not. All the cumbrous machinery of imaginary vortices, assumed without the smallest particle of evidence, appeared to these philosophers a more rational mode of explaining the heavenly motions, than one which involved what seemed to them so great an absurdity.(80)

And they no doubt found it as impossible to conceive that a body should act upon the earth from the distance of the sun or moon, as we find it to conceive an end to space or time, or two straight lines inclosing a space. Newton himself had not been able to realize the conception, or we should not have had his hypothesis of a subtle ether, the occult cause of gravitation; and his writings prove, that though he deemed the particular nature of the intermediate agency a matter of conjecture, the necessity of _some_ such agency appeared to him indubitable.

If, then, it be so natural to the human mind, even in a high state of culture, to be incapable of conceiving, and on that ground to believe impossible, what is afterward not only found to be conceivable but proved to be true; what wonder if in cases where the association is still older, more confirmed, and more familiar, and in which nothing ever occurs to shake our conviction, or even suggest to us any conception at variance with the association, the acquired incapacity should continue, and be mistaken for a natural incapacity? It is true, our experience of the varieties in nature enables us, within certain limits, to conceive other varieties analogous to them. We can conceive the sun or moon falling; for though we never saw them fall, nor ever, perhaps, imagined them falling, we have seen so many other things fall, that we have innumerable familiar analogies to assist the conception; which, after all, we should probably have some difficulty in framing, were we not well accustomed to see the sun and moon move (or appear to move), so that we are only called upon to conceive a slight change in the direction of motion, a circumstance familiar to our experience. But when experience affords no model on which to shape the new conception, how is it possible for us to form it? How, for example, can we imagine an end to space or time? We never saw any object without something beyond it, nor experienced any feeling without something following it. When, therefore, we attempt to conceive the last point of space, we have the idea irresistibly raised of other points beyond it. When we try to imagine the last instant of time, we can not help conceiving another instant after it. Nor is there any necessity to assume, as is done by a modern school of metaphysicians, a peculiar fundamental law of the mind to account for the feeling of infinity inherent in our conceptions of space and time; that apparent infinity is sufficiently accounted for by simpler and universally acknowledged laws.

Now, in the case of a geometrical axiom, such, for example, as that two straight lines can not inclose a space—a truth which is testified to us by our very earliest impressions of the external world—how is it possible (whether those external impressions be or be not the ground of our belief) that the reverse of the proposition _could_ be otherwise than inconceivable to us? What analogy have we, what similar order of facts in any other branch of our experience, to facilitate to us the conception of two straight lines inclosing a space? Nor is even this all. I have already called attention to the peculiar property of our impressions of form, that the ideas or mental images exactly resemble their prototypes, and adequately represent them for the purposes of scientific

observation. From this, and from the intuitive character of the observation, which in this case reduces itself to simple inspection, we can not so much as call up in our imagination two straight lines, in order to attempt to conceive them inclosing a space, without by that very act repeating the scientific experiment which establishes the contrary. Will it really be contended that the inconceivableness of the thing, in such circumstances, proves any thing against the experimental origin of the conviction? Is it not clear that in whichever mode our belief in the proposition may have originated, the impossibility of our conceiving the negative of it must, on either hypothesis, be the same? As, then, Dr. Whewell exhorts those who have any difficulty in recognizing the distinction held by him between necessary and contingent truths, to study geometry—a condition which I can assure him I have conscientiously fulfilled—I, in return, with equal confidence, exhort those who agree with him, to study the general laws of association; being convinced that nothing more is requisite than a moderate familiarity with those laws, to dispel the illusion which ascribes a peculiar necessity to our earliest inductions from experience, and measures the possibility of things in themselves, by the human capacity of conceiving them.

I hope to be pardoned for adding, that Dr. Whewell himself has both confirmed by his testimony the effect of habitual association in giving to an experimental truth the appearance of a necessary one, and afforded a striking instance of that remarkable law in his own person. In his _Philosophy of the Inductive Sciences_ he continually asserts, that propositions which not only are not self-evident, but which we know to have been discovered gradually, and by great efforts of genius and patience, have, when once established, appeared so self-evident that, but for historical proof, it would have been impossible to conceive that they had not been recognized from the first by all persons in a sound state of their faculties. “We now despise those who, in the Copernican controversy, could not conceive the apparent motion of the sun on the heliocentric hypothesis; or those who, in opposition to Galileo, thought that a uniform force might be that which generated a velocity proportional to the space; or those who held there was something absurd in Newton’s doctrine of the different refrangibility of differently colored rays; or those who imagined that when elements combine, their sensible qualities must be manifest in the compound; or those who were reluctant to give up the distinction of vegetables into herbs, shrubs, and trees. We can not help thinking that men must have been singularly dull of comprehension, to find a difficulty in admitting what is to us so plain and simple. We have a latent persuasion that we in their place should have been wiser and more clear-sighted; that we should have taken the right side, and given our assent at once to the truth. Yet in reality such a persuasion is a mere delusion. The persons who, in such instances as the above, were on the losing side, were very far, in most cases, from being persons more prejudiced, or stupid, or narrow-minded, than the greater part of mankind now are; and the cause for which they fought was far from being a manifestly bad one, till it had been so decided by the result of the war.... So complete has been the victory of truth in most of these instances, that at present we can hardly imagine the struggle to have been necessary. _The very essence of these triumphs is, that they lead us to regard the views we reject as not only false but inconceivable._”(81)

This last proposition is precisely what I contend for; and I ask no more, in order to overthrow the whole theory of its author on the nature of the evidence of axioms. For what is that theory? That the truth of axioms can not have been learned from experience, because their falsity is inconceivable. But Dr. Whewell himself says, that we are continually led, by the natural progress of thought, to regard as inconceivable what our forefathers not only conceived but believed, nay even (he might have added) were unable to conceive the reverse of. He can not intend to justify this mode of thought: he can not mean to say, that we can be right in regarding as inconceivable what others have conceived, and as self-evident what to others did not appear evident at all. After so complete an admission that inconceivableness is an accidental thing, not inherent in the phenomenon itself, but dependent on the mental history of the person who tries to conceive it, how can he ever call upon us to reject a proposition as impossible on no other ground than its inconceivableness? Yet he not only does so, but has unintentionally afforded some of the most remarkable examples which can be cited of the very illusion which he has himself so clearly pointed out. I select as specimens, his remarks on the evidence of the three laws of motion, and of the atomic theory.

With respect to the laws of motion, Dr. Whewell says: “No one can doubt that, in historical fact, these laws were collected from experience. That such is the case, is no matter of conjecture. We know the time, the persons, the circumstances, belonging to each step of each discovery.”(82) After this testimony, to adduce evidence of the fact would be superfluous. And not only were these laws by no means intuitively evident, but some of them were originally paradoxes. The first law was especially so. That a body, once in motion, would continue forever to move in the same direction with undiminished velocity unless acted upon by some new force, was a proposition which mankind found for a long time the greatest difficulty in crediting. It stood opposed to apparent experience of the most familiar kind, which taught that it was the nature of motion to abate gradually, and at last terminate of itself. Yet when once the contrary doctrine was firmly established, mathematicians, as Dr. Whewell observes, speedily began to believe that laws, thus contradictory to first appearances, and which, even after full proof had been obtained, it had required generations to

render familiar to the minds of the scientific world, were under “a demonstrable necessity, compelling them to be such as they are and no other;” and he himself, though not venturing “absolutely to pronounce” that _all_ these laws “can be rigorously traced to an absolute necessity in the nature of things,”(83) does actually so think of the law just mentioned; of which he says: “Though the discovery of the first law of motion was made, historically speaking, by means of experiment, we have now attained a point of view in which we see that it might have been certainly known to be true, independently of experience.”(84) Can there be a more striking exemplification than is here afforded, of the effect of association which we have described? Philosophers, for generations, have the most extraordinary difficulty in putting certain ideas together; they at last succeed in doing so; and after a sufficient repetition of the process, they first fancy a natural bond between the ideas, then experience a growing difficulty, which at last, by the continuation of the same progress, becomes an impossibility, of severing them from one another. If such be the progress of an experimental conviction of which the date is of yesterday, and which is in opposition to first appearances, how must it fare with those which are conformable to appearances familiar from the first dawn of intelligence, and of the conclusiveness of which, from the earliest records of human thought, no skeptic has suggested even a momentary doubt?

The other instance which I shall quote is a truly astonishing one, and may be called the _reductio ad absurdum_ of the theory of inconceivableness. Speaking of the laws of chemical composition, Dr. Whewell says:(85) “That they could never have been clearly understood, and therefore never firmly established, without laborious and exact experiments, is certain; but yet we may venture to say, that being once known, they possess an evidence beyond that of mere experiment. _For how in fact can we conceive combinations, otherwise than as definite in kind and quality?_ If we were to suppose each element ready to combine with any other indifferently, and indifferently in any quantity, we should have a world in which all would be confusion and indefiniteness. There would be no fixed kinds of bodies. Salts, and stones, and ores, would approach to and graduate into each other by insensible degrees. Instead of this, we know that the world consists of bodies distinguishable from each other by definite differences, capable of being classified and named, and of having general propositions asserted concerning them. And as _we can not conceive a world in which this should not be the case_, it would appear that we can not conceive a state of things in which the laws of the combination of elements should not be of that definite and measured kind which we have above asserted.”

That a philosopher of Dr. Whewell’s eminence should gravely assert that we can not conceive a world in which the simple elements should combine in other than definite proportions; that by dint of meditating on a scientific truth, the original discoverer of which was still living, he should have rendered the association in his own mind between the idea of combination and that of constant proportions so familiar and intimate as to be unable to conceive the one fact without the other; is so signal an instance of the mental law for which I am contending, that one word more in illustration must be superfluous.

In the latest and most complete elaboration of his metaphysical system (the _Philosophy of Discovery_), as well as in the earlier discourse on the _Fundamental Antithesis of Philosophy_, reprinted as an appendix to that work, Dr. Whewell, while very candidly admitting that his language was open to misconception, disclaims having intended to say that mankind in general can _now_ perceive the law of definite proportions in chemical combination to be a necessary truth. All he meant was that philosophical chemists in a future generation may possibly see this. “Some truths may be seen by intuition, but yet the intuition of them may be a rare and a difficult attainment.”(86) And he explains that the inconceivableness which, according to his theory, is the test of axioms, “depends entirely upon the clearness of the Ideas which the axioms involve. So long as those ideas are vague and indistinct, the contrary of an axiom may be assented to, though it can not be distinctly conceived. It may be assented to, not because it is possible, but because we do not see clearly what is possible. To a person who is only beginning to think geometrically, there may appear nothing absurd in the assertion that two straight lines may inclose a space. And in the same manner, to a person who is only beginning to think of mechanical truths, it may not appear to be absurd, that in mechanical processes, Reaction should be greater or less than Action; and so, again, to a person who has not thought steadily about Substance, it may not appear inconceivable, that by chemical operations, we should generate new matter, or destroy matter which already exists.”(87) Necessary truths, therefore, are not those of which we can not conceive, but “those of which we can not _distinctly_ conceive, the contrary.”(88) So long as our ideas are indistinct altogether, we do not know what is or is not capable of being distinctly conceived; but, by the ever increasing distinctness with which scientific men apprehend the general conceptions of science, they in time come to perceive that there are certain laws of nature, which, though historically and as a matter of fact they were learned from experience, we can not, now that we know them, distinctly conceive to be other than they are.

The account which I should give of this progress of the scientific mind is somewhat different. After a general law of nature has been ascertained, men’s minds do not at first acquire a complete facility of familiarly representing to themselves the phenomena of nature in the character which that law assigns to them. The habit which constitutes the scientific cast of mind, that of conceiving

facts of all descriptions conformably to the laws which regulate them—phenomena of all descriptions according to the relations which have been ascertained really to exist between them; this habit, in the case of newly-discovered relations, comes only by degrees. So long as it is not thoroughly formed, no necessary character is ascribed to the new truth. But in time, the philosopher attains a state of mind in which his mental picture of nature spontaneously represents to him all the phenomena with which the new theory is concerned, in the exact light in which the theory regards them: all images or conceptions derived from any other theory, or from the confused view of the facts which is anterior to any theory, having entirely disappeared from his mind. The mode of representing facts which results from the theory, has now become, to his faculties, the only natural mode of conceiving them. It is a known truth, that a prolonged habit of arranging phenomena in certain groups, and explaining them by means of certain principles, makes any other arrangement or explanation of these facts be felt as unnatural: and it may at last become as difficult to him to represent the facts to himself in any other mode, as it often was, originally, to represent them in that mode.

But, further (if the theory is true, as we are supposing it to be), any other mode in which he tries, or in which he was formerly accustomed, to represent the phenomena, will be seen by him to be inconsistent with the facts that suggested the new theory—facts which now form a part of his mental picture of nature. And since a contradiction is always inconceivable, his imagination rejects these false theories, and declares itself incapable of conceiving them. Their inconceivableness to him does not, however, result from any thing in the theories themselves, intrinsically and _a priori_ repugnant to the human faculties; it results from the repugnance between them and a portion of the facts; which facts as long as he did not know, or did not distinctly realize in his mental representations, the false theory did not appear other than conceivable; it becomes inconceivable, merely from the fact that contradictory elements can not be combined in the same conception. Although, then, his real reason for rejecting theories at variance with the true one, is no other than that they clash with his experience, he easily falls into the belief, that he rejects them because they are inconceivable, and that he adopts the true theory because it is self-evident, and does not need the evidence of experience at all.

This I take to be the real and sufficient explanation of the paradoxical truth, on which so much stress is laid by Dr. Whewell, that a scientifically cultivated mind is actually, in virtue of that cultivation, unable to conceive suppositions which a common man conceives without the smallest difficulty. For there is nothing inconceivable in the suppositions themselves; the impossibility is in combining them with facts inconsistent with them, as part of the same mental picture; an obstacle of course only felt by those who know the facts, and are able to perceive the inconsistency. As far as the suppositions themselves are concerned, in the case of many of Dr. Whewell's necessary truths the negative of the axiom is, and probably will be as long as the human race lasts, as easily conceivable as the affirmative. There is no axiom (for example) to which Dr. Whewell ascribes a more thorough character of necessity and self-evidence, than that of the indestructibility of matter. That this is a true law of nature I fully admit; but I imagine there is no human being to whom the opposite supposition is inconceivable—who has any difficulty in imagining a portion of matter annihilated: inasmuch as its apparent annihilation, in no respect distinguishable from real by our unassisted senses, takes place every time that water dries up, or fuel is consumed. Again, the law that bodies combine chemically in definite proportions is undeniably true; but few besides Dr. Whewell have reached the point which he seems personally to have arrived at (though he only dares prophesy similar success to the multitude after the lapse of generations), that of being unable to conceive a world in which the elements are ready to combine with one another "indifferently in any quantity;" nor is it likely that we shall ever rise to this sublime height of inability, so long as all the mechanical mixtures in our planet, whether solid, liquid, or aëriform, exhibit to our daily observation the very phenomenon declared to be inconceivable.

According to Dr. Whewell, these and similar laws of nature can not be drawn from experience, inasmuch as they are, on the contrary, assumed in the interpretation of experience. Our inability to "add to or diminish the quantity of matter in the world," is a truth which "neither is nor can be derived from experience; for the experiments which we make to verify it presuppose its truth.... When men began to use the balance in chemical analysis, they did not prove by trial, but took for granted, as self-evident, that the weight of the whole must be found in the aggregate weight of the elements."(89) True, it is assumed; but, I apprehend, no otherwise than as all experimental inquiry assumes provisionally some theory or hypothesis, which is to be finally held true or not, according as the experiments decide. The hypothesis chosen for this purpose will naturally be one which groups together some considerable number of facts already known. The proposition that the material of the world, as estimated by weight, is neither increased nor diminished by any of the processes of nature or art, had many appearances in its favor to begin with. It expressed truly a great number of familiar facts. There were other facts which it had the appearance of conflicting with, and which made its truth, as a universal law of nature, at first doubtful. Because it was doubtful, experiments were devised to verify it. Men assumed its truth hypothetically, and proceeded to try whether, on more careful examination, the phenomena which apparently pointed to a different conclusion, would not be found to be consistent with it. This turned out to be the case; and from that time the doctrine took its place

as a universal truth, but as one proved to be such by experience. That the theory itself preceded the proof of its truth—that it had to be conceived before it could be proved, and in order that it might be proved—does not imply that it was self-evident, and did not need proof. Otherwise all the true theories in the sciences are necessary and self-evident; for no one knows better than Dr. Whewell that they all began by being assumed, for the purpose of connecting them by deductions with those facts of experience on which, as evidence, they now confessedly rest.(90)

Chapter VI.

The Same Subject Continued.

§ 1. In the examination which formed the subject of the last chapter, into the nature of the evidence of those deductive sciences which are commonly represented to be systems of necessary truth, we have been led to the following conclusions. The results of those sciences are indeed necessary, in the sense of necessarily following from certain first principles, commonly called axioms and definitions; that is, of being certainly true if those axioms and definitions are so; for the word necessity, even in this acceptation of it, means no more than certainty. But their claim to the character of necessity in any sense beyond this, as implying an evidence independent of and superior to observation and experience, must depend on the previous establishment of such a claim in favor of the definitions and axioms themselves. With regard to axioms, we found that, considered as experimental truths, they rest on superabundant and obvious evidence. We inquired, whether, since this is the case, it be imperative to suppose any other evidence of those truths than experimental evidence, any other origin for our belief of them than an experimental origin. We decided, that the burden of proof lies with those who maintain the affirmative, and we examined, at considerable length, such arguments as they have produced. The examination having led to the rejection of those arguments, we have thought ourselves warranted in concluding that axioms are but a class, the most universal class, of inductions from experience; the simplest and easiest cases of generalization from the facts furnished to us by our senses or by our internal consciousness.

While the axioms of demonstrative sciences thus appeared to be experimental truths, the definitions, as they are incorrectly called, in those sciences, were found by us to be generalizations from experience which are not even, accurately speaking, truths; being propositions in which, while we assert of some kind of object, some property or properties which observation shows to belong to it, we at the same time deny that it possesses any other properties, though in truth other properties do in every individual instance accompany, and in almost all instances modify, the property thus exclusively predicated. The denial, therefore, is a mere fiction, or supposition, made for the purpose of excluding the consideration of those modifying circumstances, when their influence is of too trifling amount to be worth considering, or adjourning it, when important to a more convenient moment.

From these considerations it would appear that Deductive or Demonstrative Sciences are all, without exception, Inductive Sciences; that their evidence is that of experience; but that they are also, in virtue of the peculiar character of one indispensable portion of the general formulæ according to which their inductions are made, Hypothetical Sciences. Their conclusions are only true on certain suppositions, which are, or ought to be, approximations to the truth, but are seldom, if ever, exactly true; and to this hypothetical character is to be ascribed the peculiar certainty, which is supposed to be inherent in demonstration.

What we have now asserted, however, cannot be received as universally true of Deductive or Demonstrative Sciences, until verified by being applied to the most remarkable of all those sciences, that of Numbers; the theory of the Calculus; Arithmetic and Algebra. It is harder to believe of the doctrines of this science than of any other, either that they are not truths _a priori_, but experimental truths, or that their peculiar certainty is owing to their being not absolute but only conditional truths. This, therefore, is a case which merits examination apart; and the more so, because on this subject we have a double set of doctrines to contend with; that of the _a priori_ philosophers on one side; and on the other, a theory the most opposite to theirs, which was at one time very generally received, and is still far from being altogether exploded, among metaphysicians.

§ 2. This theory attempts to solve the difficulty apparently inherent in the case, by representing the propositions of the science of numbers as merely verbal, and its processes as simple transformations of language, substitutions of one expression for another. The proposition, Two and one is equal to three, according to these writers, is not a truth, is not the assertion of a really existing fact, but a definition of the word three; a statement that mankind have agreed to use the name three as a sign exactly equivalent to two and one; to call by the former name whatever is called by the other more clumsy phrase. According to this doctrine, the longest process in algebra is but a succession of changes in terminology, by which equivalent expressions are substituted one for another; a series of translations of the same fact, from one into another language; though how, after such a series of translations, the fact itself comes out changed (as when we demonstrate a new geometrical theorem by algebra), they have not explained; and it is a

difficulty which is fatal to their theory.

It must be acknowledged that there are peculiarities in the processes of arithmetic and algebra which render the theory in question very plausible, and have not unnaturally made those sciences the stronghold of Nominalism. The doctrine that we can discover facts, detect the hidden processes of nature, by an artful manipulation of language, is so contrary to common sense, that a person must have made some advances in philosophy to believe it: men fly to so paradoxical a belief to avoid, as they think, some even greater difficulty, which the vulgar do not see. What has led many to believe that reasoning is a mere verbal process, is, that no other theory seemed reconcilable with the nature of the Science of Numbers. For we do not carry any ideas along with us when we use the symbols of arithmetic or of algebra. In a geometrical demonstration we have a mental diagram, if not one on paper; AB, AC, are present to our imagination as lines, intersecting other lines, forming an angle with one another, and the like; but not so _a_ and _b_. These may represent lines or any other magnitudes, but those magnitudes are never thought of; nothing is realized in our imagination but _a_ and _b_. The ideas which, on the particular occasion, they happen to represent, are banished from the mind during every intermediate part of the process, between the beginning, when the premises are translated from things into signs, and the end, when the conclusion is translated back from signs into things. Nothing, then, being in the reasoner's mind but the symbols, what can seem more inadmissible than to contend that the reasoning process has to do with any thing more? We seem to have come to one of Bacon's Prerogative Instances; an _experimentum crucis_ on the nature of reasoning itself.

Nevertheless, it will appear on consideration, that this apparently so decisive instance is no instance at all; that there is in every step of an arithmetical or algebraical calculation a real induction, a real inference of facts from facts; and that what disguises the induction is simply its comprehensive nature, and the consequent extreme generality of the language. All numbers must be numbers of something: there are no such things as numbers in the abstract. _Ten_ must mean ten bodies, or ten sounds, or ten beatings of the pulse. But though numbers must be numbers of something, they may be numbers of any thing. Propositions, therefore, concerning numbers, have the remarkable peculiarity that they are propositions concerning all things whatever; all objects, all existences of every kind, known to our experience. All things possess quantity; consist of parts which can be numbered; and in that character possess all the properties which are called properties of numbers. That half of four is two, must be true whatever the word four represents, whether four hours, four miles, or four pounds weight. We need only conceive a thing divided into four equal parts (and all things may be conceived as so divided), to be able to predicate of it every property of the number four, that is, every arithmetical proposition in which the number four stands on one side of the equation. Algebra extends the generalization still farther: every number represents that particular number of all things without distinction, but every algebraical symbol does more, it represents all numbers without distinction. As soon as we conceive a thing divided into equal parts, without knowing into what number of parts, we may call it _a_ or _x_, and apply to it, without danger of error, every algebraical formula in the books. The proposition, 2 (_a_ + _b_)= 2 _a_ + 2 _b_, is a truth co-extensive with all nature. Since then algebraical truths are true of all things whatever, and not, like those of geometry, true of lines only or of angles only, it is no wonder that the symbols should not excite in our minds ideas of any things in particular. When we demonstrate the forty-seventh proposition of Euclid, it is not necessary that the words should raise in us an image of all right-angled triangles, but only of some one right-angled triangle: so in algebra we need not, under the symbol _a_, picture to ourselves all things whatever, but only some one thing; why not, then, the letter itself? The mere written characters, _a_, _b_, _x_, _y_, _z_, serve as well for representatives of Things in general, as any more complex and apparently more concrete conception. That we are conscious of them, however, in their character of things, and not of mere signs, is evident from the fact that our whole process of reasoning is carried on by predicating of them the properties of things. In resolving an algebraic equation, by what rules do we proceed? By applying at each step to _a_, _b_, and _x_, the proposition that equals added to equals make equals; that equals taken from equals leave equals; and other propositions founded on these two. These are not properties of language, or of signs as such, but of magnitudes, which is as much as to say, of all things. The inferences, therefore, which are successively drawn, are inferences concerning things, not symbols; though as any Things whatever will serve the turn, there is no necessity for keeping the idea of the Thing at all distinct, and consequently the process of thought may, in this case, be allowed without danger to do what all processes of thought, when they have been performed often, will do if permitted, namely, to become entirely mechanical. Hence the general language of algebra comes to be used familiarly without exciting ideas, as all other general language is prone to do from mere habit, though in no other case than this can it be done with complete safety. But when we look back to see from whence the probative force of the process is derived, we find that at every single step, unless we suppose ourselves to be thinking and talking of the things, and not the mere symbols, the evidence fails.

There is another circumstance, which, still more than that which we have now mentioned, gives plausibility to the notion that the propositions of arithmetic and algebra are merely verbal. That is, that when considered as propositions respecting Things, they all

have the appearance of being identical propositions. The assertion, Two and one is equal to three, considered as an assertion respecting objects, as for instance, “Two pebbles and one pebble are equal to three pebbles,” does not affirm equality between two collections of pebbles, but absolute identity. It affirms that if we put one pebble to two pebbles, those very pebbles are three. The objects, therefore, being the very same, and the mere assertion that “objects are themselves” being insignificant, it seems but natural to consider the proposition, Two and one is equal to three, as asserting mere identity of signification between the two names.

This, however, though it looks so plausible, will not bear examination. The expression “two pebbles and one pebble,” and the expression “three pebbles,” stand indeed for the same aggregation of objects, but they by no means stand for the same physical fact. They are names of the same objects, but of those objects in two different states: though they _de_note the same things, their _con_notation is different. Three pebbles in two separate parcels, and three pebbles in one parcel, do not make the same impression on our senses; and the assertion that the very same pebbles may by an alteration of place and arrangement be made to produce either the one set of sensations or the other, though a very familiar proposition, is not an identical one. It is a truth known to us by early and constant experience: an inductive truth; and such truths are the foundation of the science of Number. The fundamental truths of that science all rest on the evidence of sense; they are proved by showing to our eyes and our fingers that any given number of objects—ten balls, for example—may by separation and re-arrangement exhibit to our senses all the different sets of numbers the sums of which is equal to ten. All the improved methods of teaching arithmetic to children proceed on a knowledge of this fact. All who wish to carry the child’s _mind_ along with them in learning arithmetic; all who wish to teach numbers, and not mere ciphers—now teach it through the evidence of the senses, in the manner we have described.

We may, if we please, call the proposition, “Three is two and one,” a definition of the number three, and assert that arithmetic, as it has been asserted that geometry, is a science founded on definitions. But they are definitions in the geometrical sense, not the logical; asserting not the meaning of a term only, but along with it an observed matter of fact. The proposition, “A circle is a figure bounded by a line which has all its points equally distant from a point within it,” is called the definition of a circle; but the proposition from which so many consequences follow, and which is really a first principle in geometry, is, that figures answering to this description exist. And thus we may call “Three is two and one” a definition of three; but the calculations which depend on that proposition do not follow from the definition itself, but from an arithmetical theorem presupposed in it, namely, that collections of objects exist, which while they impress the senses thus, [Symbol: three circles, two above one], may be separated into two parts, thus, [Symbol: two circles, a space, and a third circle]. This proposition being granted, we term all such parcels Threes, after which the enunciation of the above-mentioned physical fact will serve also for a definition of the word Three.

The Science of Number is thus no exception to the conclusion we previously arrived at, that the processes even of deductive sciences are altogether inductive, and that their first principles are generalizations from experience. It remains to be examined whether this science resembles geometry in the further circumstance, that some of its inductions are not exactly true; and that the peculiar certainty ascribed to it, on account of which its propositions are called Necessary Truths, is fictitious and hypothetical, being true in no other sense than that those propositions legitimately follow from the hypothesis of the truth of premises which are avowedly mere approximations to truth.

§ 3. The inductions of arithmetic are of two sorts: first, those which we have just expounded, such as One and one are two, Two and one are three, etc., which may be called the definitions of the various numbers, in the improper or geometrical sense of the word Definition; and secondly, the two following axioms: The sums of equals are equal, The differences of equals are equal. These two are sufficient; for the corresponding propositions respecting unequals may be proved from these by a _reductio ad absurdum_.

These axioms, and likewise the so-called definitions, are, as has already been said, results of induction; true of all objects whatever, and, as it may seem, exactly true, without the hypothetical assumption of unqualified truth where an approximation to it is all that exists. The conclusions, therefore, it will naturally be inferred, are exactly true, and the science of number is an exception to other demonstrative sciences in this, that the categorical certainty which is predicable of its demonstrations is independent of all hypothesis.

On more accurate investigation, however, it will be found that, even in this case, there is one hypothetical element in the ratiocination. In all propositions concerning numbers, a condition is implied, without which none of them would be true; and that condition is an assumption which may be false. The condition is, that 1=1; that all the numbers are numbers of the same or of equal units. Let this be doubtful, and not one of the propositions of arithmetic will hold true. How can we know that one pound and one pound make two pounds, if one of the pounds may be troy, and the other avoirdupois? They may not make two pounds of either, or

of any weight. How can we know that a forty-horse power is always equal to itself, unless we assume that all horses are of equal strength? It is certain that 1 is always equal in _number_ to 1; and where the mere number of objects, or of the parts of an object, without supposing them to be equivalent in any other respect, is all that is material, the conclusions of arithmetic, so far as they go to that alone, are true without mixture of hypothesis. There are such cases in statistics; as, for instance, an inquiry into the amount of the population of any country. It is indifferent to that inquiry whether they are grown people or children, strong or weak, tall or short; the only thing we want to ascertain is their number. But whenever, from equality or inequality of number, equality or inequality in any other respect is to be inferred, arithmetic carried into such inquiries becomes as hypothetical a science as geometry. All units must be assumed to be equal in that other respect; and this is never accurately true, for one actual pound weight is not exactly equal to another, nor one measured mile's length to another; a nicer balance, or more accurate measuring instruments, would always detect some difference.

What is commonly called mathematical certainty, therefore, which comprises the twofold conception of unconditional truth and perfect accuracy, is not an attribute of all mathematical truths, but of those only which relate to pure Number, as distinguished from Quantity in the more enlarged sense; and only so long as we abstain from supposing that the numbers are a precise index to actual quantities. The certainty usually ascribed to the conclusions of geometry, and even to those of mechanics, is nothing whatever but certainty of inference. We can have full assurance of particular results under particular suppositions, but we can not have the same assurance that these suppositions are accurately true, nor that they include all the data which may exercise an influence over the result in any given instance.

§ 4. It appears, therefore, that the method of all Deductive Sciences is hypothetical. They proceed by tracing the consequences of certain assumptions; leaving for separate consideration whether the assumptions are true or not, and if not exactly true, whether they are a sufficiently near approximation to the truth. The reason is obvious. Since it is only in questions of pure number that the assumptions are exactly true, and even there only so long as no conclusions except purely numerical ones are to be founded on them; it must, in all other cases of deductive investigation, form a part of the inquiry, to determine how much the assumptions want of being exactly true in the case in hand. This is generally a matter of observation, to be repeated in every fresh case; or if it has to be settled by argument instead of observation, may require in every different case different evidence, and present every degree of difficulty, from the lowest to the highest. But the other part of the process—namely, to determine what else may be concluded if we find, and in proportion as we find, the assumptions to be true—may be performed once for all, and the results held ready to be employed as the occasions turn up for use. We thus do all beforehand that can be so done, and leave the least possible work to be performed when cases arise and press for a decision. This inquiry into the inferences which can be drawn from assumptions, is what properly constitutes Demonstrative Science.

It is of course quite as practicable to arrive at new conclusions from facts assumed, as from facts observed; from fictitious, as from real, inductions. Deduction, as we have seen, consists of a series of inferences in this form—_a_ is a mark of _b_, _b_ of _c_, _c_ of _d_, therefore _a_ is a mark of _d_, which last may be a truth inaccessible to direct observation. In like manner it is allowable to say, _suppose_ that a were a mark of _b_, _b_ of _c_, and _c_ of _d_, _a_ would be a mark of _d_, which last conclusion was not thought of by those who laid down the premises. A system of propositions as complicated as geometry might be deduced from assumptions which are false; as was done by Ptolemy, Descartes, and others, in their attempts to explain synthetically the phenomena of the solar system on the supposition that the apparent motions of the heavenly bodies were the real motions, or were produced in some way more or less different from the true one. Sometimes the same thing is knowingly done, for the purpose of showing the falsity of the assumption; which is called a _reductio ad absurdum_. In such cases, the reasoning is as follows: _a_ is a mark of _b_, and _b_ of _c_; now if c were also a mark of _d, a_ would be a mark of _d_; but _d_ is known to be a mark of the absence of _a_; consequently _a_ would be a mark of its own absence, which is a contradiction; therefore _c_ is not a mark of _d_.

§ 5. It has even been held by some writers, that all ratiocination rests in the last resort on a _reductio ad absurdum_; since the way to enforce assent to it, in case of obscurity, would be to show that if the conclusion be denied we must deny some one at least of the premises, which, as they are all supposed true, would be a contradiction. And in accordance with this, many have thought that the peculiar nature of the evidence of ratiocination consisted in the impossibility of admitting the premises and rejecting the conclusion without a contradiction in terms. This theory, however, is inadmissible as an explanation of the grounds on which ratiocination itself rests. If any one denies the conclusion notwithstanding his admission of the premises, he is not involved in any direct and express contradiction until he is compelled to deny some premise; and he can only be forced to do this by a _reductio ad absurdum_, that is, by another ratiocination: now, if he denies the validity of the reasoning process itself, he can no more be forced to assent to the second syllogism than to the first. In truth, therefore, no one is ever forced to a contradiction in terms: he can only

be forced to a contradiction (or rather an infringement) of the fundamental maxim of ratiocination, namely, that whatever has a mark, has what it is a mark of; or (in the case of universal propositions), that whatever is a mark of any thing, is a mark of whatever else that thing is a mark of. For in the case of every correct argument, as soon as thrown into the syllogistic form, it is evident without the aid of any other syllogism, that he who, admitting the premises, fails to draw the conclusion, does not conform to the above axiom.

We have now proceeded as far in the theory of Deduction as we can advance in the present stage of our inquiry. Any further insight into the subject requires that the foundation shall have been laid of the philosophic theory of Induction itself; in which theory that of Deduction, as a mode of Induction, which we have now shown it to be, will assume spontaneously the place which belongs to it, and will receive its share of whatever light may be thrown upon the great intellectual operation of which it forms so important a part.

Chapter VII.

Examination Of Some Opinions Opposed To The Preceding Doctrines.

§ 1. Polemical discussion is foreign to the plan of this work. But an opinion which stands in need of much illustration, can often receive it most effectually, and least tediously, in the form of a defense against objections. And on subjects concerning which speculative minds are still divided, a writer does but half his duty by stating his own doctrine, if he does not also examine, and to the best of his ability judge, those of other thinkers.

In the dissertation which Mr. Herbert Spencer has prefixed to his, in many respects, highly philosophical treatise on the Mind,(91) he criticises some of the doctrines of the two preceding chapters, and propounds a theory of his own on the subject of first principles. Mr. Spencer agrees with me in considering axioms to be “simply our earliest inductions from experience.” But he differs from me “widely as to the worth of the test of inconceivableness.” He thinks that it is the ultimate test of all beliefs. He arrives at this conclusion by two steps. First, we never can have any stronger ground for believing any thing, than that the belief of it “invariably exists.” Whenever any fact or proposition is invariably believed; that is, if I understand Mr. Spencer rightly, believed by all persons, and by one’s self at all times; it is entitled to be received as one of the primitive truths, or original premises of our knowledge. Secondly, the criterion by which we decide whether any thing is invariably believed to be true, is our inability to conceive it as false. “The inconceivability of its negation is the test by which we ascertain whether a given belief invariably exists or not.” “For our primary beliefs, the fact of invariable existence, tested by an abortive effort to cause their non-existence, is the only reason assignable.” He thinks this the sole ground of our belief in our own sensations. If I believe that I feel cold, I only receive this as true because I can not conceive that I am not feeling cold. “While the proposition remains true, the negation of it remains inconceivable.” There are numerous other beliefs which Mr. Spencer considers to rest on the same basis; being chiefly those, or a part of those, which the metaphysicians of the Reid and Stewart school consider as truths of immediate intuition. That there exists a material world; that this is the very world which we directly and immediately perceive, and not merely the hidden cause of our perceptions; that Space, Time, Force, Extension, Figure, are not modes of our consciousness, but objective realities; are regarded by Mr. Spencer as truths known by the inconceivableness of their negatives. We can not, he says, by any effort, conceive these objects of thought as mere states of our mind; as not having an existence external to us. Their real existence is, therefore, as certain as our sensations themselves. The truths which are the subject of direct knowledge, being, according to this doctrine, known to be truths only by the inconceivability of their negation; and the truths which are not the object of direct knowledge, being known as inferences from those which are; and those inferences being believed to follow from the premises, only because we can not conceive them not to follow; inconceivability is thus the ultimate ground of all assured beliefs.

Thus far, there is no very wide difference between Mr. Spencer’s doctrine and the ordinary one of philosophers of the intuitive school, from Descartes to Dr. Whewell; but at this point Mr. Spencer diverges from them. For he does not, like them, set up the test of inconceivability as infallible. On the contrary, he holds that it may be fallacious, not from any fault in the test itself, but because “men have mistaken for inconceivable things, some things which were not inconceivable.” And he himself, in this very book, denies not a few propositions usually regarded as among the most marked examples of truths whose negations are inconceivable. But occasional failure, he says, is incident to all tests. If such failure vitiates “the test of inconceivableness,” it “must similarly vitiate all tests whatever. We consider an inference logically drawn from established premises to be true. Yet in millions of cases men have been wrong in the inferences they have thought thus drawn. Do we therefore argue that it is absurd to consider an inference true on no other ground than that it is logically drawn from established premises? No: we say that though men may have taken for logical inferences, inferences that were not logical, there nevertheless _are_ logical inferences, and that we are justified in assuming the

truth of what seem to us such, until better instructed. Similarly, though men may have thought some things inconceivable which were not so, there may still be inconceivable things; and the inability to conceive the negation of a thing, may still be our best warrant for believing it.... Though occasionally it may prove an imperfect test, yet, as our most certain beliefs are capable of no better, to doubt any one belief because we have no higher guarantee for it, is really to doubt all beliefs." Mr. Spencer's doctrine, therefore, does not erect the curable, but only the incurable limitations of the human conceptive faculty, into laws of the outward universe.

§ 2. The doctrine, that "a belief which is proved by the inconceivableness of its negation to invariably exist, is true," Mr. Spencer enforces by two arguments, one of which may be distinguished as positive, and the other as negative.

The positive argument is, that every such belief represents the aggregate of all past experience. "Conceding the entire truth of" the "position, that during any phase of human progress, the ability or inability to form a specific conception wholly depends on the experiences men have had; and that, by a widening of their experiences, they may, by and by, be enabled to conceive things before inconceivable to them, it may still be argued that as, at any time, the best warrant men can have for a belief is the perfect agreement of all pre-existing experience in support of it, it follows that, at any time, the inconceivableness of its negation is the deepest test any belief admits of.... Objective facts are ever impressing themselves upon us; our experience is a register of these objective facts; and the inconceivableness of a thing implies that it is wholly at variance with the register. Even were this all, it is not clear how, if every truth is primarily inductive, any better test of truth could exist. But it must be remembered that while many of these facts, impressing themselves upon us, are occasional; while others again are very general; some are universal and unchanging. These universal and unchanging facts are, by the hypothesis, certain to establish beliefs of which the negations are inconceivable; while the others are not certain to do this; and if they do, subsequent facts will reverse their action. Hence if, after an immense accumulation of experiences, there remain beliefs of which the negations are still inconceivable, most, if not all of them, must correspond to universal objective facts. If there be ... certain absolute uniformities in nature; if these uniformities produce, as they must, absolute uniformities in our experience; and if ... these absolute uniformities in our experience disable us from conceiving the negations of them; then answering to each absolute uniformity in nature which we can cognize, there must exist in us a belief of which the negation is inconceivable, and which is absolutely true. In this wide range of cases subjective inconceivableness must correspond to objective impossibility. Further experience will produce correspondence where it may not yet exist; and we may expect the correspondence to become ultimately complete. In nearly all cases this test of inconceivableness must be valid now" (I wish I could think we were so nearly arrived at omniscience); "and where it is not, it still expresses the net result of our experience up to the present time; which is the most that any test can do."

To this I answer, first, that it is by no means true that the inconceivability, by us, of the negative of a proposition proves all, or even any, "pre-existing experience" to be in favor of the affirmative. There may have been no such pre-existing experiences, but only a mistaken supposition of experience. How did the inconceivability of antipodes prove that experience had given any testimony against their possibility? How did the incapacity men felt of conceiving sunset otherwise than as a motion of the sun, represent any "net result" of experience in support of its being the sun and not the earth that moves? It is not experience that is represented, it is only a superficial semblance of experience. The only thing proved with regard to real experience, is the negative fact, that men have _not had_ it of the kind which would have made the inconceivable proposition conceivable.

Next: Even if it were true that inconceivableness represents the net result of all past experience, why should we stop at the representative when we can get at the thing represented? If our incapacity to conceive the negation of a given supposition is proof of its truth, because proving that our experience has hitherto been uniform in its favor, the real evidence for the supposition is not the inconceivableness, but the uniformity of experience. Now this, which is the substantial and only proof, is directly accessible. We are not obliged to presume it from an incidental consequence. If all past experience is in favor of a belief, let this be stated, and the belief openly rested on that ground: after which the question arises, what that fact may be worth as evidence of its truth? For uniformity of experience is evidence in very different degrees: in some cases it is strong evidence, in others weak, in others it scarcely amounts to evidence at all. That all metals sink in water, was a uniform experience, from the origin of the human race to the discovery of potassium in the present century by Sir Humphry Davy. That all swans are white, was a uniform experience down to the discovery of Australia. In the few cases in which uniformity of experience does amount to the strongest possible proof, as with such propositions as these, Two straight lines can not inclose a space, Every event has a cause, it is not because their negations are inconceivable, which is not always the fact; but because the experience, which has been thus uniform, pervades all nature. It will be shown in the following Book that none of the conclusions either of induction or of deduction can be considered certain, except as far as their truth is shown to be inseparably bound up with truths of this class.

I maintain then, first, that uniformity of past experience is very far from being universally a criterion of truth. But secondly, inconceivableness is still further from being a test even of that test. Uniformity of contrary experience is only one of many causes of inconceivability. Tradition handed down from a period of more limited knowledge, is one of the commonest. The mere familiarity of one mode of production of a phenomenon often suffices to make every other mode appear inconceivable. Whatever connects two ideas by a strong association may, and continually does, render their separation in thought impossible; as Mr. Spencer, in other parts of his speculations, frequently recognizes. It was not for want of experience that the Cartesians were unable to conceive that one body could produce motion in another without contact. They had as much experience of other modes of producing motion as they had of that mode. The planets had revolved, and heavy bodies had fallen, every hour of their lives. But they fancied these phenomena to be produced by a hidden machinery which they did not see, because without it they were unable to conceive what they did see. The inconceivableness, instead of representing their experience, dominated and overrode their experience. Without dwelling further on what I have termed the positive argument of Mr. Spencer in support of his criterion of truth, I pass to his negative argument, on which he lays more stress.

§ 3. The negative argument is, that, whether inconceivability be good evidence or bad, no stronger evidence is to be obtained. That what is inconceivable can not be true, is postulated in every act of thought. It is the foundation of all our original premises. Still more it is assumed in all conclusions from those premises. The invariability of belief, tested by the inconceivableness of its negation, “is our sole warrant for every demonstration. Logic is simply a systematization of the process by which we indirectly obtain this warrant for beliefs that do not directly possess it. To gain the strongest conviction possible respecting any complex fact, we either analytically descend from it by successive steps, each of which we unconsciously test by the inconceivableness of its negation, until we reach some axiom or truth which we have similarly tested; or we synthetically ascend from such axiom or truth by such steps. In either case we connect some isolated belief, with a belief which invariably exists, by a series of intermediate beliefs which invariably exist.” The following passage sums up the theory: “When we perceive that the negation of the belief is inconceivable, we have all possible warrant for asserting the invariability of its existence: and in asserting this, we express alike our logical justification of it, and the inexorable necessity we are under of holding it.... We have seen that this is the assumption on which every conclusion whatever ultimately rests. We have no other guarantee for the reality of consciousness, of sensations, of personal existence; we have no other guarantee for any axiom; we have no other guarantee for any step in a demonstration. Hence, as being taken for granted in every act of the understanding, it must be regarded as the Universal Postulate.” But as this postulate, which we are under an “inexorable necessity” of holding true, is sometimes false; as “beliefs that once were shown by the inconceivableness of their negations to invariably exist, have since been found untrue,” and as “beliefs that now possess this character may some day share the same fate;” the canon of belief laid down by Mr. Spencer is, that “the most certain conclusion” is that “which involves the postulate the fewest times.” Reasoning, therefore, never ought to prevail against one of the immediate beliefs (the belief in Matter, in the outward reality of Extension, Space, and the like), because each of these involves the postulate only once; while an argument, besides involving it in the premises, involves it again in every step of the ratiocination, no one of the successive acts of inference being recognized as valid except because we can not conceive the conclusion not to follow from the premises.

It will be convenient to take the last part of this argument first. In every reasoning, according to Mr. Spencer, the assumption of the postulate is renewed at every step. At each inference we judge that the conclusion follows from the premises, our sole warrant for that judgment being that we can not conceive it not to follow. Consequently if the postulate is fallible, the conclusions of reasoning are more vitiated by that uncertainty than direct intuitions; and the disproportion is greater, the more numerous the steps of the argument.

To test this doctrine, let us first suppose an argument consisting only of a single step, which would be represented by one syllogism. This argument does rest on an assumption, and we have seen in the preceding chapters what the assumption is. It is, that whatever has a mark, has what it is a mark of. The evidence of this axiom I shall not consider at present;(92) let us suppose it (with Mr. Spencer) to be the inconceivableness of its reverse.

Let us now add a second step to the argument: we require, what? Another assumption? No: the same assumption a second time; and so on to a third, and a fourth. I confess I do not see how, on Mr. Spencer’s own principles, the repetition of the assumption at all weakens the force of the argument. If it were necessary the second time to assume some other axiom, the argument would no doubt be weakened, since it would be necessary to its validity that both axioms should be true, and it might happen that one was true and not the other: making two chances of error instead of one. But since it is the _same_ axiom, if it is true once it is true every time; and if the argument, being of a hundred links, assumed the axiom a hundred times, these hundred assumptions would make but one chance of error among them all. It is satisfactory that we are not obliged to suppose the deductions of pure mathematics to

be among the most uncertain of argumentative processes, which on Mr. Spencer's theory they could hardly fail to be, since they are the longest. But the number of steps in an argument does not subtract from its reliableness, if no new _premises_, of an uncertain character, are taken up by the way.(93)

To speak next of the premises. Our assurance of their truth, whether they be generalities or individual facts, is grounded, in Mr. Spencer's opinion, on the inconceivableness of their being false. It is necessary to advert to a double meaning of the word inconceivable, which Mr. Spencer is aware of, and would sincerely disclaim founding an argument upon, but from which his case derives no little advantage notwithstanding. By inconceivableness is sometimes meant, inability to form or get rid of an _idea_; sometimes, inability to form or get rid of a _belief_. The former meaning is the most conformable to the analogy of language; for a conception always means an idea, and never a belief. The wrong meaning of "inconceivable" is, however, fully as frequent in philosophical discussion as the right meaning, and the intuitive school of metaphysicians could not well do without either. To illustrate the difference, we will take two contrasted examples. The early physical speculators considered antipodes incredible, because inconceivable. But antipodes were not inconceivable in the primitive sense of the word. An idea of them could be formed without difficulty: they could be completely pictured to the mental eye. What was difficult, and, as it then seemed, impossible, was to apprehend them as believable. The idea could be put together, of men sticking on by their feet to the under side of the earth; but the belief _would_ follow, that they must fall off. Antipodes were not unimaginable, but they were unbelievable.

On the other hand, when I endeavor to conceive an end to extension, the two ideas refuse to come together. When I attempt to form a conception of the last point of space, I can not help figuring to myself a vast space beyond that last point. The combination is, under the conditions of our experience, unimaginable. This double meaning of inconceivable it is very important to bear in mind, for the argument from inconceivableness almost always turns on the alternate substitution of each of those meanings for the other.

In which of these two senses does Mr. Spencer employ the term, when he makes it a test of the truth of a proposition that its negation is inconceivable? Until Mr. Spencer expressly stated the contrary, I inferred from the course of his argument, that he meant unbelievable. He has, however, in a paper published in the fifth number of the _Fortnightly Review_, disclaimed this meaning, and declared that by an inconceivable proposition he means, now and always, "one of which the terms can not, by any effort, be brought before consciousness in that relation which the proposition asserts between them—a proposition of which the subject and predicate offer an insurmountable resistance to union in thought." We now, therefore, know positively that Mr. Spencer always endeavors to use the word inconceivable in this, its proper, sense: but it may yet be questioned whether his endeavor is always successful; whether the other, and popular use of the word, does not sometimes creep in with its associations, and prevent him from maintaining a clear separation between the two. When, for example, he says, that when I feel cold, I can not conceive that I am not feeling cold, this expression can not be translated into "I can not conceive myself not feeling cold," for it is evident that I can: the word conceive, therefore, is here used to express the recognition of a matter of fact—the perception of truth or falsehood; which I apprehend to be exactly the meaning of an act of belief, as distinguished from simple conception. Again, Mr. Spencer calls the attempt to conceive something which is inconceivable "an abortive effort to cause the non-existence," not of a conception or mental representation, but of a belief. There is need, therefore, to revise a considerable part of Mr. Spencer's language, if it is to be kept always consistent with his definition of inconceivability. But in truth the point is of little importance; since inconceivability, in Mr. Spencer's theory, is only a test of truth, inasmuch as it is a test of believability. The inconceivableness of a supposition is the extreme case of its unbelievability. This is the very foundation of Mr. Spencer's doctrine. The invariability of the belief is with him the real guarantee. The attempt to conceive the negative is made in order to test the inevitableness of the belief. It should be called, an attempt to _believe_ the negative. When Mr. Spencer says that while looking at the sun a man can not conceive that he is looking into darkness, he should have said that a man can not _believe_ that he is doing so. For it is surely possible, in broad daylight, to _imagine_ one's self looking into darkness.(94) As Mr. Spencer himself says, speaking of the belief of our own existence, "That he _might_ not exist, he can conceive well enough; but that he _does_ not exist, he finds it impossible to conceive," _i.e._, to believe. So that the statement resolves itself into this: That I exist, and that I have sensations, I believe, because I can not believe otherwise. And in this case every one will admit that the impossibility is real. Any one's present sensations, or other states of subjective consciousness, that one person inevitably believes. They are facts known _per se_: it is impossible to ascend beyond them. Their negative is really unbelievable, and therefore there is never any question about believing it. Mr. Spencer's theory is not needed for these truths.

But according to Mr. Spencer there are other beliefs, relating to other things than our own subjective feelings, for which we have the same guarantee—which are, in a similar manner, invariable and necessary. With regard to these other beliefs, they can not be necessary, since they do not always exist. There have been, and are, many persons who do not believe the reality of an external

world, still less the reality of extension and figure as the forms of that external world; who do not believe that space and time have an existence independent of the mind—nor any other of Mr. Spencer's objective intuitions. The negations of these alleged invariable beliefs are not unbelievable, for they are believed. It may be maintained, without obvious error, that we can not _imagine_ tangible objects as mere states of our own and other people's consciousness; that the perception of them irresistibly suggests to us the _idea_ of something external to ourselves: and I am not in a condition to say that this is not the fact (though I do not think any one is entitled to affirm it of any person besides himself). But many thinkers have believed, whether they could conceive it or not, that what we represent to ourselves as material objects, are mere modifications of consciousness; complex feelings of touch and of muscular action. Mr. Spencer may think the inference correct from the unimaginable to the unbelievable, because he holds that belief itself is but the persistence of an idea, and that what we can succeed in imagining we can not at the moment help apprehending as believable. But of what consequence is it what we apprehend at the moment, if the moment is in contradiction to the permanent state of our mind? A person who has been frightened when an infant by stories of ghosts, though he disbelieves them in after years (and perhaps never believed them), may be unable all his life to be in a dark place, in circumstances stimulating to the imagination, without mental discomposure. The idea of ghosts, with all its attendant terrors, is irresistibly called up in his mind by the outward circumstances. Mr. Spencer may say, that while he is under the influence of this terror he does not disbelieve in ghosts, but has a temporary and uncontrollable belief in them. Be it so; but allowing it to be so, which would it be truest to say of this man on the whole—that he believes in ghosts, or that he does not believe in them? Assuredly that he does not believe in them. The case is similar with those who disbelieve a material world. Though they can not get rid of the idea; though while looking at a solid object they can not help having the conception, and therefore, according to Mr. Spencer's metaphysics, the momentary belief, of its externality; even at that moment they would sincerely deny holding that belief: and it would be incorrect to call them other than disbelievers of the doctrine. The belief therefore is not invariable; and the test of inconceivableness fails in the only cases to which there could ever be any occasion to apply it.

That a thing may be perfectly believable, and yet may not have become conceivable, and that we may habitually believe one side of an alternative, and conceive only in the other, is familiarly exemplified in the state of mind of educated persons respecting sunrise and sunset. All educated persons either know by investigation, or believe on the authority of science, that it is the earth and not the sun which moves: but there are probably few who habitually _conceive_ the phenomenon otherwise than as the ascent or descent of the sun. Assuredly no one can do so without a prolonged trial; and it is probably not easier now than in the first generation after Copernicus. Mr. Spencer does not say, "In looking at sunrise it is impossible not to conceive that it is the sun which moves, therefore this is what every body believes, and we have all the evidence for it that we can have for any truth." Yet this would be an exact parallel to his doctrine about the belief in matter.

The existence of matter, and other Noumena, as distinguished from the phenomenal world, remains a question of argument, as it was before; and the very general, but neither necessary nor universal, belief in them, stands as a psychological phenomenon to be explained, either on the hypothesis of its truth, or on some other. The belief is not a conclusive proof of its own truth, unless there are no such things as _idola tribûs_; but being a fact, it calls on antagonists to show, from what except the real existence of the thing believed, so general and apparently spontaneous a belief can have originated. And its opponents have never hesitated to accept this challenge.(95) The amount of their success in meeting it will probably determine the ultimate verdict of philosophers on the question.

§ 4. In the revision, or rather reconstruction, of his "Principles of Psychology," as one of the stages or platforms in the imposing structure of his System of Philosophy, Mr. Spencer has resumed what he justly terms(96) the "amicable controversy that has been long pending between us;" expressing at the same time a regret, which I cordially share, that "this lengthened exposition of a single point of difference, unaccompanied by an exposition of the numerous points of concurrence, unavoidably produces an appearance of dissent very far greater than that which exists." I believe, with Mr. Spencer, that the difference between us, if measured by our conclusions, is "superficial rather than substantial;" and the value I attach to so great an amount of agreement, in the field of analytic psychology, with a thinker of his force and depth, is such as I can hardly overstate. But I also agree with him that the difference which exists in our premises is one of "profound importance, philosophically considered;" and not to be dismissed while any part of the case of either of us has not been fully examined and discussed.

In his present statement of the Universal Postulate, Mr. Spencer has exchanged his former expression, "beliefs which invariably exist," for the following: "cognitions of which the predicates invariably exist along with their subjects." And he says that "an abortive effort to conceive the negation of a proposition, shows that the cognition expressed is one of which the predicate invariably exists along with its subject; and the discovery that the predicate invariably exists along with its subject, is the discovery that this cognition

is one we are compelled to accept." Both these premises of Mr. Spencer's syllogism I am able to assent to, but in different senses of the middle term. If the invariable existence of the predicate along with its subject, is to be understood in the most obvious meaning, as an existence in actual Nature, or in other words, in our objective, or sensational, experience, I of course admit that this, once ascertained, compels us to accept the proposition: but then I do not admit that the failure of an attempt to conceive the negative, proves the predicate to be always co-existent with the subject in actual Nature. If, on the other hand (which I believe to be Mr. Spencer's meaning) the invariable existence of the predicate along with the subject is to be understood only of our conceptive faculty, _i.e._, that the one is inseparable from the other in our thoughts; then, indeed, the inability to separate the two ideas proves their inseparable conjunction, here and now, in the mind which has failed in the attempt; but this inseparability in thought does not prove a corresponding inseparability in fact; nor even in the thoughts of other people, or of the same person in a possible future.

"That some propositions have been wrongly accepted as true, because their negations were supposed inconceivable when they were not," does not, in Mr. Spencer's opinion, "disprove the validity of the test;" not only because any test whatever "is liable to yield untrue results, either from incapacity or from carelessness in those who use it," but because the propositions in question "were complex propositions, not to be established by a test applicable to propositions no further decomposable." "A test legitimately applicable to a simple proposition, the subject and predicate of which are in direct relation, can not be legitimately applied to a complex proposition, the subject and predicate of which are indirectly related through the many simple propositions implied." "That things which are equal to the same thing are equal to one another, is a fact which can be known by direct comparison of actual or ideal relations.... But that the square of the hypothenuse of a right-angled triangle equals the sum of the squares of the other two sides, can not be known immediately by comparison of two states of consciousness: here the truth can be reached only mediately, through a series of simple judgments respecting the likenesses or unlikenesses of certain relations." Moreover, even when the proposition admits of being tested by immediate consciousness, people often neglect to do it. A school-boy, in adding up a column of figures, will say "35 and 9 are 46," though this is contrary to the verdict which consciousness gives when 35 and 9 are really called up before it; but this is not done. And not only school-boys, but men and thinkers, do not always "distinctly translate into their equivalent states of consciousness the words they use."

It is but just to give Mr. Spencer's doctrine the benefit of the limitation he claims—viz., that it is only applicable to propositions which are assented to on simple inspection, without any intervening media of proof. But this limitation does not exclude some of the most marked instances of propositions now known to be false or groundless, but whose negative was once found inconceivable: such as, that in sunrise and sunset it is the sun which moves; that gravitation may exist without an intervening medium; and even the case of antipodes. The distinction drawn by Mr. Spencer is real; but, in the case of the propositions classed by him as complex, consciousness, until the media of proof are supplied, gives no verdict at all: it neither declares the equality of the square of the hypothenuse with the sum of the squares of the sides to be inconceivable, nor their inequality to be inconceivable. But in all the three cases which I have just cited, the inconceivability seems to be apprehended directly; no train of argument was needed, as in the case of the square of the hypothenuse, to obtain the verdict of consciousness on the point. Neither is any of the three a case like that of the school-boy's mistake, in which the mind was never really brought into contact with the proposition. They are cases in which one of two opposite predicates, _mero adspectu_, seemed to be incompatible with the subject, and the other, therefore, to be proved always to exist with it.(97)

As now limited by Mr. Spencer, the ultimate cognitions fit to be submitted to his test are only those of so universal and elementary a character as to be represented in the earliest and most unvarying experience, or apparent experience, of all mankind. In such cases the inconceivability of the negative, if real, is accounted for by the experience: and why (I have asked) should the truth be tested by the inconceivability, when we can go further back for proof—namely, to the experience itself? To this Mr. Spencer answers, that the experiences can not be all recalled to mind, and if recalled, would be of unmanageable multitude. To test a proposition by experience seems to him to mean that "before accepting as certain the proposition that any rectilineal figure must have as many angles as it has sides," I have "to think of every triangle, square, pentagon, hexagon, etc., which I have ever seen, and to verify the asserted relation in each case." I can only say, with surprise, that I do not understand this to be the meaning of an appeal to experience. It is enough to know that one has been seeing the fact all one's life, and has never remarked any instance to the contrary, and that other people, with every opportunity of observation, unanimously declare the same thing. It is true, even this experience may be insufficient, and so it might be even if I could recall to mind every instance of it; but its insufficiency, instead of being brought to light, is disguised, if instead of sifting the experience itself, I appeal to a test which bears no relation to the sufficiency of the experience, but, at the most, only to its familiarity. These remarks do not lose their force even if we believe, with Mr. Spencer, that mental tendencies originally derived from experience impress themselves permanently on the cerebral structure and are transmitted by inheritance, so that modes of thinking which are acquired by the race become innate and _a priori_ in the

individual, thus representing, in Mr. Spencer's opinion, the experience of his progenitors, in addition to his own. All that would follow from this is, that a conviction might be really innate, _i.e._, prior to individual experience, and yet not be true, since the inherited tendency to accept it may have been originally the result of other causes than its truth.

Mr. Spencer would have a much stronger case, if he could really show that the evidence of Reasoning rests on the Postulate, or, in other words, that we believe that a conclusion follows from premises only because we can not conceive it not to follow. But this statement seems to me to be of the same kind as one I have previously commented on, viz., that I believe I see light, because I can not, while the sensation remains, conceive that I am looking into darkness. Both these statements seem to me incompatible with the meaning (as very rightly limited by Mr. Spencer) of the verb to conceive. To say that when I apprehend that A is B and that B is C, I can not conceive that A is not C, is to my mind merely to say that I am compelled to _believe_ that A is C. If to conceive be taken in its proper meaning, viz., to form a mental representation, I _may_ be able to conceive A as not being C. After assenting, with full understanding, to the Copernican proof that it is the earth and not the sun that moves, I not only can conceive, or represent to myself, sunset as a motion of the sun, but almost every one finds this conception of sunset easier to form, than that which they nevertheless know to be the true one.

§ 5. Sir William Hamilton holds as I do, that inconceivability is no criterion of impossibility. "There is no ground for inferring a certain fact to be impossible, merely from our inability to conceive its possibility." "Things there are which _may_, nay _must_, be true, of which the understanding is wholly unable to construe to itself the possibility."(98) Sir William Hamilton is, however, a firm believer in the _a priori_ character of many axioms, and of the sciences deduced from them; and is so far from considering those axioms to rest on the evidence of experience, that he declares certain of them to be true even of Noumena—of the Unconditioned—of which it is one of the principal aims of his philosophy to pro

PREFACE

The following essays have been written and published at various times, and my thanks are due to the previous publishers for the permission to reprint them.

The essay on "Mysticism and Logic" appeared in the _Hibbert Journal_ for July, 1914. "The Place of Science in a Liberal Education" appeared in two numbers of _The New Statesman_, May 24 and 31, 1913. "The Free Man's Worship" and "The Study of Mathematics" were included in a former collection (now out of print), _Philosophical Essays_, also published by Messrs. Longmans, Green & Co. Both were written in 1902; the first appeared originally in the _Independent Review_ for 1903, the second in the _New Quarterly_, November, 1907. In theoretical Ethics, the position advocated in "The Free Man's Worship" is not quite identical with that which I hold now: I feel less convinced than I did then of the objectivity of good and evil. But the general attitude towards life which is suggested in that essay still seems to me, in the main, the one which must be adopted in times of stress and difficulty by those who have no dogmatic religious beliefs, if inward defeat is to be avoided.

The essay on "Mathematics and the Metaphysicians" was written in 1901, and appeared in an American magazine, _The International Monthly_, under the title "Recent Work in the Philosophy of Mathematics." Some points in this essay require modification in view of later work. These are indicated in footnotes. Its tone is partly explained by the fact that the editor begged me to make the article "as romantic as possible."

All the above essays are entirely popular, but those that follow are somewhat more technical. "On Scientific Method in Philosophy" was the Herbert Spencer lecture at Oxford in 1914, and was published by the Clarendon Press, which has kindly allowed me to include it in this collection. "The Ultimate Constituents of Matter" was an address to the Manchester Philosophical Society, early in 1915, and was published in the _Monist_ in July of that year. The essay on "The Relation of Sense-data to Physics" was written in January, 1914, and first appeared in No. 4 of that year's volume of _Scientia_, an International Review of Scientific Synthesis, edited by M. Eugenio Rignano, published monthly by Messrs. Williams and Norgate, London, Nicola Zanichelli, Bologna, and Félix Alcan, Paris. The essay "On the Notion of Cause" was the presidential address to the Aristotelian Society in November, 1912, and was published in their _Proceedings_ for 1912-13. "Knowledge by Acquaintance and Knowledge by Description" was also a paper read before the Aristotelian Society, and published in their _Proceedings_ for 1910-11.

MYSTICISM AND LOGIC AND OTHER ESSAYS

I

MYSTICISM AND LOGIC

Metaphysics, or the attempt to conceive the world as a whole by means of thought, has been developed, from the first, by the union and conflict of two very different human impulses, the one urging men towards mysticism, the other urging them towards science. Some men have achieved greatness through one of these impulses alone, others through the other alone: in Hume, for example, the scientific impulse reigns quite unchecked, while in Blake a strong hostility to science co-exists with profound mystic insight. But the greatest men who have been philosophers have felt the need both of science and of mysticism: the attempt to harmonise the two was what made their life, and what always must, for all its arduous uncertainty, make philosophy, to some minds, a greater thing than either science or religion.

Before attempting an explicit characterisation of the scientific and the mystical impulses, I will illustrate them by examples from two philosophers whose greatness lies in the very intimate blending which they achieved. The two philosophers I mean are Heraclitus and Plato.

Heraclitus, as every one knows, was a believer in universal flux: time builds and destroys all things. From the few fragments that remain, it is not easy to discover how he arrived at his opinions, but there are some sayings that strongly suggest scientific observation as the source.

"The things that can be seen, heard, and learned," he says, "are what I prize the most." This is the language of the empiricist, to whom observation is the sole guarantee of truth. "The sun is new every day," is another fragment; and this opinion, in spite of its paradoxical character, is obviously inspired by scientific reflection, and no doubt seemed to him to obviate the difficulty of understanding how the sun can work its way underground from west to east during the night. Actual observation must also have suggested to him his central doctrine, that Fire is the one permanent substance, of which all visible things are passing phases. In combustion we see things change utterly, while their flame and heat rise up into the air and vanish.

"This world, which is the same for all," he says, "no one of gods or men has made; but it was ever, is now, and ever shall be, an ever-living Fire, with measures kindling, and measures going out."

"The transformations of Fire are, first of all, sea; and half of the sea is earth, half whirlwind."

This theory, though no longer one which science can accept, is nevertheless scientific in spirit. Science, too, might have inspired the famous saying to which Plato alludes: "You cannot step twice into the same rivers; for fresh waters are ever flowing in upon you." But we find also another statement among the extant fragments: "We step and do not step into the same rivers; we are and are not."

The comparison of this statement, which is mystical, with the one quoted by Plato, which is scientific, shows how intimately the two tendencies are blended in the system of Heraclitus. Mysticism is, in essence, little more than a certain intensity and depth of feeling in regard to what is believed about the universe; and this kind of feeling leads Heraclitus, on the basis of his science, to strangely poignant sayings concerning life and the world, such as:

"Time is a child playing draughts, the kingly power is a child's."

It is poetic imagination, not science, which presents Time as despotic lord of the world, with all the irresponsible frivolity of a child. It is mysticism, too, which leads Heraclitus to assert the identity of opposites: "Good and ill are one," he says; and again: "To God all things are fair and good and right, but men hold some things wrong and some right."

Much of mysticism underlies the ethics of Heraclitus. It is true that a scientific determinism alone might have inspired the statement: "Man's character is his fate"; but only a mystic would have said:

"Every beast is driven to the pasture with blows"; and again:

"It is hard to fight with one's heart's desire. Whatever it wishes to get, it purchases at the cost of soul"; and again:

"Wisdom is one thing. It is to know the thought by which all things are steered through all things."[1]

Examples might be multiplied, but those that have been given are enough to show the character of the man: the facts of science, as they appeared to him, fed the flame in his soul, and in its light he saw into the depths of the world by the reflection of his own dancing swiftly penetrating fire. In such a nature we see the true union of the mystic and the man of science--the highest eminence, as I think, that it is possible to achieve in the world of thought.

In Plato, the same twofold impulse exists, though the mystic impulse is distinctly the stronger of the two, and secures ultimate victory whenever the conflict is sharp. His description of the cave is the classical statement of belief in a knowledge and reality truer and more real than that of the senses:

"Imagine[2] a number of men living in an underground cavernous chamber, with an entrance open to the light, extending along the entire length of the cavern, in which they have been confined, from their childhood, with their legs and necks so shackled that they are obliged to sit still and look straight forwards, because their chains render it impossible for them to turn their heads round: and imagine a bright fire burning some way off, above and behind them, and an elevated roadway passing between the fire and the prisoners, with a low wall built along it, like the screens which conjurors put up in front of their audience, and above which they exhibit their wonders.

I have it, he replied.

Also figure to yourself a number of persons walking behind this wall, and carrying with them statues of men, and images of other animals, wrought in wood and stone and all kinds of materials, together with various other articles, which overtop the wall; and, as you might expect, let some of the passers-by be talking, and others silent.

You are describing a strange scene, and strange prisoners.

They resemble us, I replied.

Now consider what would happen if the course of nature brought them a release from their fetters, and a remedy for their foolishness, in the following manner. Let us suppose that one of them has been released, and compelled suddenly to stand up, and turn his neck round and walk with open eyes towards the light; and let us suppose that he goes through all these actions with pain, and that the dazzling splendour renders him incapable of discerning those objects of which he used formerly to see the shadows. What answer should you expect him to make, if some one were to tell him that in those days he was watching foolish phantoms, but that now he is somewhat nearer to reality, and is turned towards things more real, and sees more correctly; above all, if he were to point out to him the several objects that are passing by, and question him, and compel him to answer what they are? Should you

not expect him to be puzzled, and to regard his old visions as truer than the objects now forced upon his notice?

Yes, much truer....

Hence, I suppose, habit will be necessary to enable him to perceive objects in that upper world. At first he will be most successful in distinguishing shadows; then he will discern the reflections of men and other things in water, and afterwards the realities; and after this he will raise his eyes to encounter the light of the moon and stars, finding it less difficult to study the heavenly bodies and the heaven itself by night, than the sun and the sun's light by day.

Doubtless.

Last of all, I imagine, he will be able to observe and contemplate the nature of the sun, not as it _appears_ in water or on alien ground, but as it is in itself in its own territory.

Of course.

His next step will be to draw the conclusion, that the sun is the author of the seasons and the years, and the guardian of all things in the visible world, and in a manner the cause of all those things which he and his companions used to see.

Obviously, this will be his next step....

Now this imaginary case, my dear Glancon, you must apply in all its parts to our former statements, by comparing the region which the eye reveals to the prison house, and the light of the fire therein to the power of the sun: and if, by the upward ascent and the contemplation of the upper world, you understand the mounting of the soul into the intellectual region, you will hit the tendency of my own surmises, since you desire to be told what they are; though, indeed, God only knows whether they are correct. But, be that as it may, the view which I take of the subject is to the following effect. In the world of knowledge, the essential Form of Good is the limit of our enquiries, and can barely be perceived; but, when perceived, we cannot help concluding that it is in every case the source of all that is bright and beautiful,--in the visible world giving birth to light and its master, and in the intellectual world dispensing, immediately and with full authority, truth and reason;--and that whosoever would act wisely, either in private or in public, must set this Form of Good before his eyes."

But in this passage, as throughout most of Plato's teaching, there is an identification of the good with the truly real, which became embodied in the philosophical tradition, and is still largely operative in our own day. In thus allowing a legislative function to the good, Plato produced a divorce between philosophy and science, from which, in my opinion, both have suffered ever since and are still suffering. The man of science, whatever his hopes may be, must lay them aside while he studies nature; and the philosopher, if he is to achieve truth, must do the same. Ethical considerations can only legitimately appear when the truth has been ascertained: they can and should appear as determining our feeling towards the truth, and our manner of ordering our lives in view of the truth, but not as themselves dictating what the truth is to be.

There are passages in Plato--among those which illustrate the scientific side of his mind--where he seems clearly aware of this. The most noteworthy is the one in which Socrates, as a young man, is explaining the theory of ideas to Parmenides.

After Socrates has explained that there is an idea of the good, but not of such things as hair and mud and dirt, Parmenides advises him "not to despise even the meanest things," and this advice shows the genuine scientific temper. It is with this impartial temper that the mystic's apparent insight into a higher reality and a hidden good has to be combined if philosophy is to realise its greatest possibilities. And it is failure in this respect that has made so much of idealistic philosophy thin, lifeless, and insubstantial. It is only in marriage with the world that our ideals can bear fruit: divorced from it, they remain barren. But marriage with the world is not to be achieved by an ideal which shrinks from fact, or demands in advance that the world shall conform to its desires.

Parmenides himself is the source of a peculiarly interesting strain of mysticism which pervades Plato's thought--the mysticism which may be called "logical" because it is embodied in theories on logic. This form of mysticism, which appears, so far as the West is concerned, to have originated with Parmenides, dominates the reasonings of all the great mystical metaphysicians from his day to that of Hegel and his modern disciples. Reality, he says, is uncreated, indestructible, unchanging, indivisible; it is "immovable in the bonds of mighty chains, without beginning and without end; since coming into being and passing away have been driven afar, and true belief has cast them away." The fundamental principle of his inquiry is stated in a sentence which would not be out of place in Hegel: "Thou canst not know what is not--that is impossible--nor utter it; for it is the same thing that can be thought and that can be." And again: "It needs must be that what can be thought and spoken of is; for it is possible for it to be, and it is not possible

for what is nothing to be." The impossibility of change follows from this principle; for what is past can be spoken of, and therefore, by the principle, still is.

Mystical philosophy, in all ages and in all parts of the world, is characterised by certain beliefs which are illustrated by the doctrines we have been considering.

There is, first, the belief in insight as against discursive analytic knowledge: the belief in a way of wisdom, sudden, penetrating, coercive, which is contrasted with the slow and fallible study of outward appearance by a science relying wholly upon the senses. All who are capable of absorption in an inward passion must have experienced at times the strange feeling of unreality in common objects, the loss of contact with daily things, in which the solidity of the outer world is lost, and the soul seems, in utter loneliness, to bring forth, out of its own depths, the mad dance of fantastic phantoms which have hitherto appeared as independently real and living. This is the negative side of the mystic's initiation: the doubt concerning common knowledge, preparing the way for the reception of what seems a higher wisdom. Many men to whom this negative experience is familiar do not pass beyond it, but for the mystic it is merely the gateway to an ampler world.

The mystic insight begins with the sense of a mystery unveiled, of a hidden wisdom now suddenly become certain beyond the possibility of a doubt. The sense of certainty and revelation comes earlier than any definite belief. The definite beliefs at which mystics arrive are the result of reflection upon the inarticulate experience gained in the moment of insight. Often, beliefs which have no real connection with this moment become subsequently attracted into the central nucleus; thus in addition to the convictions which all mystics share, we find, in many of them, other convictions of a more local and temporary character, which no doubt become amalgamated with what was essentially mystical in virtue of their subjective certainty. We may ignore such inessential accretions, and confine ourselves to the beliefs which all mystics share.

The first and most direct outcome of the moment of illumination is belief in the possibility of a way of knowledge which may be called revelation or insight or intuition, as contrasted with sense, reason, and analysis, which are regarded as blind guides leading to the morass of illusion. Closely connected with this belief is the conception of a Reality behind the world of appearance and utterly different from it. This Reality is regarded with an admiration often amounting to worship; it is felt to be always and everywhere close at hand, thinly veiled by the shows of sense, ready, for the receptive mind, to shine in its glory even through the apparent folly and wickedness of Man. The poet, the artist, and the lover are seekers after that glory: the haunting beauty that they pursue is the faint reflection of its sun. But the mystic lives in the full light of the vision: what others dimly seek he knows, with a knowledge beside which all other knowledge is ignorance.

The second characteristic of mysticism is its belief in unity, and its refusal to admit opposition or division anywhere. We found Heraclitus saying "good and ill are one"; and again he says, "the way up and the way down is one and the same." The same attitude appears in the simultaneous assertion of contradictory propositions, such as: "We step and do not step into the same rivers; we are and are not." The assertion of Parmenides, that reality is one and indivisible, comes from the same impulse towards unity. In Plato, this impulse is less prominent, being held in check by his theory of ideas; but it reappears, so far as his logic permits, in the doctrine of the primacy of the Good.

A third mark of almost all mystical metaphysics is the denial of the reality of Time. This is an outcome of the denial of division; if all is one, the distinction of past and future must be illusory. We have seen this doctrine prominent in Parmenides; and among moderns it is fundamental in the systems of Spinoza and Hegel.

The last of the doctrines of mysticism which we have to consider is its belief that all evil is mere appearance, an illusion produced by the divisions and oppositions of the analytic intellect. Mysticism does not maintain that such things as cruelty, for example, are good, but it denies that they are real: they belong to that lower world of phantoms from which we are to be liberated by the insight of the vision. Sometimes--for example in Hegel, and at least verbally in Spinoza--not only evil, but good also, is regarded as illusory, though nevertheless the emotional attitude towards what is held to be Reality is such as would naturally be associated with the belief that Reality is good. What is, in all cases, ethically characteristic of mysticism is absence of indignation or protest, acceptance with joy, disbelief in the ultimate truth of the division into two hostile camps, the good and the bad. This attitude is a direct outcome of the nature of the mystical experience: with its sense of unity is associated a feeling of infinite peace. Indeed it may be suspected that the feeling of peace produces, as feelings do in dreams, the whole system of associated beliefs which make up the body of mystic doctrine. But this is a difficult question, and one on which it cannot be hoped that mankind will reach agreement.

Four questions thus arise in considering the truth or falsehood of mysticism, namely:

I. Are there two ways of knowing, which may be called respectively reason and intuition? And if so, is either to be preferred to the other?

II. Is all plurality and division illusory?

III. Is time unreal?

IV. What kind of reality belongs to good and evil?

On all four of these questions, while fully developed mysticism seems to me mistaken, I yet believe that, by sufficient restraint, there is an element of wisdom to be learned from the mystical way of feeling, which does not seem to be attainable in any other manner. If this is the truth, mysticism is to be commended as an attitude towards life, not as a creed about the world. The meta-physical creed, I shall maintain, is a mistaken outcome of the emotion, although this emotion, as colouring and informing all other thoughts and feelings, is the inspirer of whatever is best in Man. Even the cautious and patient investigation of truth by science, which seems the very antithesis of the mystic's swift certainty, may be fostered and nourished by that very spirit of reverence in which mysticism lives and moves.

I. REASON AND INTUITION[3]

Of the reality or unreality of the mystic's world I know nothing. I have no wish to deny it, nor even to declare that the insight which reveals it is not a genuine insight. What I do wish to maintain--and it is here that the scientific attitude becomes imperative--is that insight, untested and unsupported, is an insufficient guarantee of truth, in spite of the fact that much of the most important truth is first suggested by its means. It is common to speak of an opposition between instinct and reason; in the eighteenth century, the opposition was drawn in favour of reason, but under the influence of Rousseau and the romantic movement instinct was given the preference, first by those who rebelled against artificial forms of government and thought, and then, as the purely rationalistic defence of traditional theology became increasingly difficult, by all who felt in science a menace to creeds which they associated with a spiritual outlook on life and the world. Bergson, under the name of "intuition," has raised instinct to the position of sole arbiter of metaphysical truth. But in fact the opposition of instinct and reason is mainly illusory. Instinct, intuition, or insight is what first leads to the beliefs which subsequent reason confirms or confutes; but the confirmation, where it is possible, consists, in the last analysis, of agreement with other beliefs no less instinctive. Reason is a harmonising, controlling force rather than a creative one. Even in the most purely logical realm, it is insight that first arrives at what is new.

Where instinct and reason do sometimes conflict is in regard to single beliefs, held instinctively, and held with such determination that no degree of inconsistency with other beliefs leads to their abandonment. Instinct, like all human faculties, is liable to error. Those in whom reason is weak are often unwilling to admit this as regards themselves, though all admit it in regard to others. Where instinct is least liable to error is in practical matters as to which right judgment is a help to survival: friendship and hostility in others, for instance, are often felt with extraordinary discrimination through very careful disguises. But even in such matters a wrong impression may be given by reserve or flattery; and in matters less directly practical, such as philosophy deals with, very strong instinctive beliefs are sometimes wholly mistaken, as we may come to know through their perceived inconsistency with other equally strong beliefs. It is such considerations that necessitate the harmonising mediation of reason, which tests our beliefs by their mutual compatibility, and examines, in doubtful cases, the possible sources of error on the one side and on the other. In this there is no opposition to instinct as a whole, but only to blind reliance upon some one interesting aspect of instinct to the exclusion of other more commonplace but not less trustworthy aspects. It is such one-sidedness, not instinct itself, that reason aims at correcting.

These more or less trite maxims may be illustrated by application to Bergson's advocacy of "intuition" as against "intellect." There are, he says, "two profoundly different ways of knowing a thing. The first implies that we move round the object: the second that we enter into it. The first depends on the point of view at which we are placed and on the symbols by which we express ourselves. The second neither depends on a point of view nor relies on any symbol. The first kind of knowledge may be said to stop at the _relative_; the second, in those cases where it is possible, to attain the _absolute_."[4] The second of these, which is intuition, is, he says, "the kind of _intellectual sympathy_ by which one places oneself within an object in order to coincide with what is unique in it and therefore inexpressible" (p. 6). In illustration, he mentions self-knowledge: "there is one reality, at least, which we all seize from within, by intuition and not by simple analysis. It is our own personality in its flowing through time--our self which endures" (p. 8). The rest of Bergson's philosophy consists in reporting, through the imperfect medium of words, the knowledge gained by

intuition, and the consequent complete condemnation of all the pretended knowledge derived from science and common sense.
